MINING THE FEATHER'S CHANNEL.—Oroville *Mercury*, Aug. 15: Water was turned into the flume of the Golden Gate mine Thursday, and they are rapidly preparing to mine the channel. It will require some days to get the entire stream into the flume, and put in the elevators, sluices, etc., for mining, but the great work is progressing with all possible speed and in the most thorough manner. The big dam and flume and the mining operations will afford a sight to people who are not familiar with such gigantic mining enterprises.

Calaveras.

WHISKY SLIDE.—Calaveras *Prospect*, Aug. 10: Deffenbach and Madona are opening up their quartz mine at Whisky Slide at present, and the lode prospects uniformly throughout. The owners have just completed cleaning out their old shaft, and find that the vein in the bottom is six feet wide and of a decomposed quality that will insure an easy working by the arastra process. Several other veins are being opened up in that vicinity, and our informant says the settlers of that region have great faith in the future of their neighborhood.

WATER SUPPLY SHORT.—Angels *Echo*, Aug. 17: The sudden failure of the water supply in the mountains is a great disappointment to the people of this town. It will throw nearly 200 men out of employment, and dull times may be expected as a natural consequence. The mills will all be compelled to shut down, and it is a matter of doubt whether or not there will be a sufficient quantity of water to keep the mines pumped out.

CLOSED DOWN.—The Brunner mine at Albany Flat has been closed down for the present. Operations will probably again be resumed in the near future.

El Dorado.

FREE GOLD.—Georgetown *Gazette*, Aug. 15: The Ben Franklin is now some 60 feet prospected by shaft and is making a good showing in free gold.

Inyo.

RAILROAD.—Cor. Inyo *Index*, Aug. 14: The projected railroad through Townsend Pass and Panamint Valley will open the richest mineral country in the United States. Telescope Range of mountains, dividing Death and Panamint Valleys, has a mineral belt of some 40 miles in length, rich in ledges carrying high-grade ores of gold, silver, lead, copper, antimony, iron and other metals, while the valleys on either side have practically inexhaustible deposits of salt, soda and borax. Argus Range, on the west side of Panamint Valley, is traversed by innumerable ledges carrying precious and base metals, which are unworked from want of economical methods of treatment. Deeming an abridged description would be interesting, we will commence at the northeast corner of the Argus Range where Lee mining district is situated. The ledges are in the silurian formation, carrying horn silver, galena, sulphuret of silver, black metal and carbonate ores, rich in precious metals. Passing south through the range on the Eastern slope, a short distance from the valley, the water has cut a wide and deep gorge. The hills on either side of the canyon, which is named Darwin Wash, are bold and rugged and of a lime formation, containing enormous bodies of carbonate and sulphuret silver-bearing lead deposits, and rich veins of quartz, carrying gold and silver, have been exposed and worked sufficiently to demonstrate their value. Lookout district, some 14 miles south, has a group of rich argentiferous lead-bearing mines, from which several hundred tons have been extracted and shipped this year. On account of the great expense, none but the choicest ores can be handled.

REVENUE DISTRICT.—Again southerly in the foothills, about six miles, lying in black lime, porphyry and granite formation, we come to Revenue District, discovered by Robert Mitchell, who was also the discoverer of Reveille District, Nevada. A large amount of work has been done, the veins being rich in sulphurets, antimonial and horn silver. Ledges of copper and argentiferous lead have been exposed but now lie idle, as no practical means for successful treatment of the ores after extraction retards progress in this quarter. In the near vicinity, and of easy access from the valley, enormous veins of copper and lead crop out, upon which scarcely any work has been performed.

SHERMAN DISTRICT.—Passing Knight and Wetherill canyons, both rich in mineral-bearing ledges, Sherman District is reached, being about 16 miles south of Revenue. The rock formation here is porphyry, granite and lime, the ledges being in some cases contact veins bearing free gold and silver. Between this point and Lee District, a distance of nearly 50 miles, the mineral belt follows the mountain range, rising and dipping, forming a net-work of mineralized veins the most prominent of which have been mentioned. Thousands of undiscovered ledges exist that in the future will become metal-producing sources.

SNOW'S CANYON, six or seven miles farther south, is in lime and granite porphyry formation. A great deal of work has been done, developing numerous ledges of gold, silver and platinum. Croppings of copper and lead ores protrude above the surface but are untouched, being considered worthless at present. Many of the veins contain free milling quartz, nothing being done with them beyond assessment work, in consequence of their isolation.

SEARLES' BORAX WORKS.—Leaving Sherman District, traveling about 20 miles southerly and over a plateau a few hundred feet above Panamint valley, Searles' Borax Works and Marsh are reached. Here we find a large force of men engaged in collecting the crude material, which, after being treated in the refinery, is shipped by mule-teams to Mojave, some eighty miles south, whence the Southern Pacific Railroad conveys it to San Francisco and other markets. The marsh and works are about three miles south of the Inyo boundary and in San Bernardino county. Easterly, over the marsh and through drifting sands as white as that gathered along the sea-shore, we toil up New York canyon to the summit. A short distance from the mouth, numerous ledges of ferruginous gold-bearing quartz crop out, some of which have been developed to sufficient depth to demonstrate their merits and obtain patents from the U. S. Government. Some four or five miles farther up the canyon, in a slate formation, the Alta Consolidated Mining Company have their patented mines, owned and controlled by J. B. Haggin of San Francisco. The ores, being mostly free, are easily worked. Two hundred tons of second quality ore from this mine was worked last year at the mill in Sherman district.

Los Angeles.

ORO GRANDE.—Cor. *Miner and Artisan*, Aug. 17: One of the most promising mining camps in Los Angeles county is Oro Grande. The discoveries and developments of the past few months have been quite unexpected and almost unprecedented in the mining history of later years. It is true no great parade has been made of the mineral wealth of Oro Grande, but the gold and silver veins are there, and their value, to some extent, has already been proven. The Adams Bros. gold mine has a splendid reputation among all who are familiar with it. The Clinker mine is also said to be a valuable property. A sale is now negotiating for $60,000. The Collins mine, recently discovered in a lime quarry from which lime rock was being taken for burning in kilns at Oro Grande, is also looking well. These are but three of quite a large number of mines about Oro Grande, the united value of which may in time bring a comparatively obscure little district and village into great prominence.

Mariposa.

MALONE.—Mariposa *News*, Aug. 17: Messrs. McCormick and Hay have purchased the engine belonging to the Chinamen at Mormon Bar and are having it put in running order to use as a hoisting power at the Malone mine.

Mono.

BODIE.—*Free Press*, Aug. 19: During the past week south drift from joint winze, 1000 level, was advanced six feet, with a small streak of rich ore. South drift from west joint crosscut from joint upraise was advanced 24 feet. West crosscut from south drift, 1200 level, was advanced 10 feet.

THE BODIE CON.—During the past week north drift from joint winze, 30 feet below 1000 level, was advanced 18 feet. A small streak of rich ore is found in this drift. West crosscut, No. 2, from north drift, 1200 level, was advanced 13 feet. North drift from west crosscut from shaft 1200 level was cleaned out, retimbered, and work was resumed in the face of same yesterday.

Nevada.

IDAHO MINE.—Grass Valley *Union*, Aug. 15: With the aid of the steam pumps the water in the Idaho incline has been lowered to the No. 15 level, that point being reached on Tuesday evening, and the flow of the level was reached yesterday. This will enable operations to be resumed on No. 15, which has been under water ever since the accident which occurred on the 5th of June. The pumping will be continued until the No. 16 level is reached, which is the lowest working level in the mine, and it will take several weeks more to accomplish this. There are now four steam-pumps in use in the mine besides the main pump, which is driven by water-power. The steam-pumps are stationed respectively below No. 14 level, at No. 13, No. 12 and No. 10, each taking water from tanks as it is forced up from below, the last lift being from the No. 10 to No. 8 level, where the main tank is, and from which the water is pumped to surface by the big pumps. The steam-pumps now in use will probably be kept permanently in place after the lower levels are drained, to meet any contingency of being again flooded.

MAKING AN UPRAISE.—The recent strikes of a large vein in the east of a drift of the 180 level of the Crown Point mine has determined Mr. Gauthier to make an upraise to the surface at that point for the more convenient transportation of ore to the mill. The upraise will be about 210 feet, coming to the surface on the hillside east of the works, and from thence a tramway will be laid to the mill. The power to run the hoist at the upraise will be transmitted by rope-cable from the main hoisting works, which are situated over the main shaft.

NEW EUREKA.—*Tidings*, Aug. 15: We are informed by Mr. Weldon that, judging from the outlook, work on the New Eureka will be resumed in a very few days. So mote it be. Mons. Gauthier proposes to make an upraise from the point in the 180-level where the recent strike was made in the Crown Point. This is to enable more economic work. The upraise will come to the surface on the hillside east of the works, from which a tramway will be laid to the mill. Power will be transmitted from the present works, by wire cable, for hoisting from the upraise.

Placer.

HOGSBACK.—Placer *Republican*, Aug. 15: On Tuesday of last week the miners at the Hogsback mine struck 20 inches of water, which flowed so fast that the shaft was soon filled to the top, and they barely had time to get out their pumps. The shaft had been sunk 250 feet lower than the tunnel. As the whole works were soon filled up, the only thing to do was to quit work and await instructions from Paris. It is expected that the company will begin work on a new tunnel which Supt. Ralston hopes to commence about September 1st. It will be located 300 feet lower than the old one, and will be 2250 feet long, or 567 feet longer than the old one. It will require about ten months to run it.

YIELDING WELL.—Placer *Argus*, Aug. 17: The Breece & Wheeler mine at Bath is yielding the richest ore that has been taken out for years. An increased force has been placed on the mine. T. M. Tharpe and White are taking out rich ore at the Old Moore mine on Duncan hill. Over $1000 was pounded out with a hand mortar from decomposed quartz last week.

Shasta.

IGO.—Cor. Shasta *Courier*, Aug. 17: The Red Bluff parties who are interested in the Crystal have also bonded the two Chicago properties and are repairing the mill and taking out ore. P. Gibney is still crosscutting on his ledge, the rock being very hard. Wright's arastra is running on ore from his Greasewood ledge. Shirland's arastra is running on Atlantic ore. E. L. Ballou's arastra is running on Falls and Manzanita ore. Litten has found some good-looking silver ore on one of his ledges. Whit George has struck it very good in his Muletown ledge.

FRENCH GULCH.—Redding *Free Press*, Aug. 17: Mr. A. Reaves, who was in from French Gulch on Tuesday, informs us that Fox, Van Mater and Johnson are working some very fine ore at the Wheeler mill on Kline gulch, which they had taken out of their location east of the Wheeler claim. At Deadwood, the old Willey mine is again coming to the front, and turning out some very rich ore. George Kline has let a contract for 150 feet of tunnel into the Bismarck claim. The syndicate which has purchased W. T. Coleman's mining property promises to make things lively at the Gulch.

OLD DIGGINGS.—Mr. Perham of Redding has obtained the contract for hauling ore from the Mammoth mine to the Central mill. The foundation for Walker Bros.' new mill is finished, and the machinery is being hauled down from Star gulch.

Sierra.

GRAVEL AND QUARTZ.—Sierra *Tribune*, Aug. 15: The Golden Star drift mine near Alleghany is being worked at a profit by W. A. Hanly and son. There is somewhat of a revival in prospecting around Alleghany. Keep your eye on that district. The Scotch company which has been operating on the ridge near Gibsonville for a couple of years past in prospecting for gravel will, it is said, soon begin the sinking of a double-compartment shaft. The shaft is to be put down 500 feet. The northern part of this county is all right. Drift mining is doing the business. The Alaska quartz mine at Pike City, which yielded $227,000 in 11 months, is lying idle. At the Tennessee drift claim near Poker Flat, owned by Thomas Corbett, two men are employed. This is one of the biggest paying little gravel mines in Northern Sierra. Brown, Hill and Jones also have a good-paying drift claim just over the hill northeast of the Tennessee. The Bunker Hill mine, east from Gibsonville, is running in full blast with a force of about 40 men employed. This mine is paying a handsome profit to its owners; superintendent, W. Metcalf; secretary, D. Boland. J. S. Gould, Lewis Ham and other parties have leased the tailings at the mine and are now engaged in working them. Work is still being pushed ahead at the Gibraltar drift mine. The Happy Hollow drift mine at Port Wine employs about 50 men and is paying well. This makes things livelier around Port Wine than it has been for years previous. There is also considerable prospecting going on there. The Riffle drift claim at Grass Flat is working about 30 men, and is returning comfortable dividends to its owners. John Fessler, who has a quartz claim on Kanaka creek, about a mile from Alleghany, is doing fairly well from all accounts. If reports are to be believed, he has, with the aid of one man and a hand mortar, taken out anywhere from $20,000 to $30,000 during the past couple of years. Frank Hauber is still carrying on developments at his quartz mine near Alleghany. T. H. Phillips and Thos. Murty are engaged in running ahead the lower tunnel, which is in a distance of 260 feet. Horace Brown is still prosecuting work at the Kentón quartz mine below Alleghany. He run the mill last winter and made some profitable cleanups. "Doc" Bowers of Alleghany is still engaged in prospecting his drift claim at Kimberlin ravine. Messrs. Moulton, Shaffer, Matherson, Benning, Fuller and Evans are operating the Hard Scrabble drift mine at Forest City. It is located on the o'd Bald Mountain ground. They are running a tunnel and taking out pay. Jas. McGregor and others are also working on the Bald Mountain ground. The owners of the South Fork gravel mine at Forest City are prosecuting developments and taking out pay gravel. H. A. Raymond is preparing for a good winter's work at the Seventy-Six drift mine. M. Harp and J. J. Thompson own the Sierra quartz claim. It is situated on Kanaka creek south of Alleghany. Last year they struck a rich bunch of ore and took out a neat little sum of money. They are now engaged in putting through a raise from the lower tunnel to the upper one in the hopes of striking more rich spots. The Ruby drift mine at Forest City continues to be a steady and reliable bullion-producer. Thirty-five men are employed. At the Wallace Consolidated drift claim the tunnel has been run 535 feet. H. M. Bradbury and Walter Lawry recently completed their contract of running 100 feet. The Arizona drift claim, situated on the ridge above Forest City, is not working at present, but the company expects to put on men soon to run ahead the lower tunnel, which is already in upward of 2000 feet.

A PROMISING MINE.—Sierra *Tribune*, Aug. 16: The South End is the name of a quartz mine located three years ago by W. G. Montgomery. It is about one-quarter of a mile south of the Red Chief claims. The upper tunnel is in 35 feet. In this tunnel the owner struck a rich bunch of ore last year. He pounded it up in a hand mortar and realized therefrom the neat little sum of $500. A lower tunnel has been run into the mountain a distance of 230 feet. The ledge in the adit measures 32 feet in width and shows fine prospects in free gold and sulphurets. The depth acquired on the vein by the lower tunnel is 100 feet.

THE MARIPOSA.—The above quartz mine was known in former years as the Sacramento. It is located south of Alleghany, on Kanaka creek. It is owned by Harrison Appel and Andrew Grant. There are three tunnels run on the vein at a distance of about 40 feet apart. No. 1 tunnel is run 210 feet. At a distance of 200 feet in this adit a rich bunch of ore was encountered a few months ago, which yielded the owners several thousand dollars. No. 2 tunnel is in 115 feet, while No. 3, or the upper tunnel, has been run 142. Mr. Appel is now engaged with one man in pushing ahead the lower and middle tunnels. It is his intention soon, however, to put a raise through between the tunnels. The vein is well defined.

NEW MILL.—*Mountain Messenger*, Aug. 17: The Garibaldi Co., at the lower end of Gold Valley, have their five-stamp mill almost completed. They have yet to build a long tramway.

BALD MOUNTAIN.—The Bald Mountain Ex. Co., Downieville, have levied an assessment of three cents a share. Bedrock is growing softer, and 32 feet was made last week, against 22 during the previous six days. The main tunnel is in near 3200 feet. E. B. Lacrue and Dan Reilly were up to the Horseshoe mine this week. Dan has taken a contract to run 80 feet of a crosscut, and John Erb will be his partner. Wm. Rowe and Chas. Beightol have leased the diggings of John Meyer, at Secret Canyon, and are making money.

GOOD GRAVEL.—Wednesday evening Charles Heintzen telegraphed from Forest City the good news that fine-looking gravel had been found in the Wallis Consolidated drift mine, a few miles above Forest City, a very convincing proof that a channel extends up the ridge through the Bald Mountain Extension and adjacent mining properties.

THE GOLD LAKE M. CO., situated between Gold Valley and Gold Lake, are pushing things ahead as fast as possible. They are putting up a mill and boarding-house, and have a large number of men at work.

Siskiyou.

PLACER AND HYDRAULIC.—Yreka *Journal*, Aug. 21: The miners at Oro Fino and vicinity have been unable to work their placer and hydraulic mines to any extent this season, on account of scarcity of water during the present unusual dry season, but expect to do well next season. Wright & Fletcher will no doubt take out a thousand dollars a day with sufficient water to work their giants, as their ground will pay a dollar to the bedrock foot, and they have a large extent of ground. The Eastlick Bros. also have good placer ground in same vicinity which will pay handsomely with an abundance of water. The quartz miners, however, are able to continue operations, but could do much better with more water. In Quartz valley, Hon. R. H. Campbell will take out an immense quantity of gold, if the coming winter will cover the Salmon mountains with a good supply of snow to feed his ditches next spring. The snowfalls last winter having all been exceedingly light, render a very short run this season. The quartz miners in this valley have sufficient water for their mills and are doing as well as usual. The miners on the Klamath say if the Klamath City dam people will just let the water of the river run steadily, they will cause no trouble, but to hold the water and let it go to raise the river six or eight inches, forces them to keep raising and lowering their water-wheels. When the river is lowered, the wheels stop until let down, and when the river is raised six or eight inches with the wheels lowered, they move too lively. At the Schroeder & Werner quartz mine, on Deadwood creek, new buildings are being constructed for the accommodation of the miners, at a cost of about $4000, and five more stamps are to be added to the mill to keep 60 men employed in getting out quartz and running the mill during the season of next year. This is one of the best-paying quartz mines in the county.

LONE STAR.—Yreka *Union*, Aug. 17: J. F. Boyle feels jubilant over the showing for a big thing for himself and others at the Lone Star mine, Humbug creek. He was in town Sunday and had with him a lump of gold, approximating in value $3000, which was the proceeds of the crushing out of about 40 tons of quartz at the McCook mill. The ledge from which this was taken gives every appearance of being a continuous one, and promises to pay the enterprising workers handsomely. Mr. B. says he has enough quartz out to keep the mill going for some weeks.

San Bernardino.

CALICO.—Cor. Los Angeles *Miner and Artisan*, Aug. 17: The King mine, which has such widespread notoriety, owing to the richness of its ores and the extent of the ore bodies, is almost in the town of Calico, lying on the flanks of a rugged red mountain immediately north of the city. After a period of idleness, pending the necessary repairs of their mill at Daggett, a full force of men was put to work the first of the month, and the heavily laden ore-wagons are hauling the rock to the mill.

THE ORIENTAL, which lies immediately in front of the King, is shipping ore regularly from the big bonanza opened some months ago. It seems to come up to the "great expectations" placed upon it some time since. The Oriental is the property of the Runover Company. They employ 25 men in the mine.

THE OCCIDENTAL, in East Calico, is working 25 men, shipping rich chloride rock from the new bonanza. The Occidental has been in bonanza now for about five years, and is one of the best properties on the coast.

THE WATERLOO.—The great mine of West Calico is booming along in good shape, having increased the force of miners recently, employing now 100 men. The output is about 200 tons every 24 hours.

THE ODESSA, belonging to the same company as the Occidental (the Runover), is shipping regularly. The output of the camp is now about 9000 tons a month.

CHLORIDERS.—Chloriders are at work in various parts of the camp, doing well. Some of them are taking out some very good ore.

San Diego.

HELVETIA.—Julian *Sentinel*, Aug. 15: The shaft at the end of the new tunnel in the Helvetia was commenced this week. It will be sunk to a depth of 200 feet as fast as men and money can do the work.

Trinity.

TRINITY CENTER.—*Journal*, Aug. 17: We visited Bloss & McClary's placer mine and found Mr. Bloss and his crew of men busy at work. They have a good supply of water and prospects are favorable for a good cleanup. The mine is undoubt-

edly among the largest in the county. The company also have splendid water rights, taking water from Swift creek.

NEVADA.

Washoe District.

CONFIDENCE-CHALLENGE.—Virginia *Enterprise*, Aug. 17: The joint Challenge Con. Imperial and Confidence west crosscut from the 500 north drift is in a distance of 27 feet, having been commenced since last report. The face shows a mixture of quartz and porphyry.

HALE & NORCROSS.—On the 500 level the upraise from the east crosscut was advanced 8 feet; total, 30. The top of this raise is still in good ore. Are putting square sets in preparatory to extracting ore when milling is resumed. Are still retimbering the main west drift on this level. Are retimbering the main shaft above the 1300 level, and have men on repairs wherever needed on the different levels.

BELCHER.—The 1300 raise has connected with the 1200 south drift and affords a fine circulation of air, coming up the raise and out of the incline. The connection just made by the Seg. Belcher & Midas Company with the Overman on the 1100 level is of great benefit to the Belcher, and materially augmented the circulation of air on this level.

OVERMAN.—Have extended the north drift from the winze 18 feet. Material, porphyry and quartz. Upraise from west drift is up 24 feet. Material, porphyry and quartz. At a point 63 feet above west crosscut No. 3 have drifted west 20 feet and extended the incline upraise 43 feet.

CHOLLAR.—The north lateral drift on the 750 level is out 400 feet; face in porphyry. The north lateral drift on the 850 level is out 67 feet; face in hard porphyry. The west crosscut 150 feet north of south line, 650 level, is out 65 feet, the last five feet in quartz giving low assays.

SEG. BELCHER.—Have connected the south drift from the 1100 crosscut with the Overman workings and obtained a fine circulation of air. Have started the 1000 south drift from the Belcher raise and are 23 feet in ore ground. The face is in vein material.

SAVAGE.—On the 500 level the west prospecting drift started in the north drift from the upraise was advanced 17 feet, its total length now being 45 feet. This drift passed through two feet of fair-grade ore, and the face is now in quartz and porphyry.

ALPHA.—The west crosscut on the south line, 382 level, is out 160 feet; face in quartz of no value. The west crosscut 60 feet from the shaft is out 500 feet. The west crosscut on the south line, 500 level, is out 217 feet; face in hard porphyry.

CROWN POINT.—Have completed the connection between the 1100 south drift and the Belcher north drift. Are running a southeast drift from the 500 level raise, 17 feet below the 400 level, and are out 45 feet in clay and porphyry.

JUSTICE.—The north and south winze, 60 feet below the 490 level, are yielding the usual amount of good ore. Shipped to the mill during the week 200 tons of ore; average battery samples, $21 29 per ton.

CON. IMPERIAL.—The north drift on the 1300 level is now in a distance of 362 feet from the south line, having been extended 22 feet during the week. The face still continues to show quartz and porphyry.

SILVER HILL.—Southeast drift, 160 level, at a point 630 feet distant, started a crosscut in a northwesterly direction and made a connection on the eighth level, giving a fine circulation of air there.

POTOSI.—Have been engaged the past week in retimbering the south drift on the 850 level. The east crosscut, 550 feet south of Chollar shaft, 950 level, is out 13 feet; face in clay and porphyry.

EXCHEQUER.—On the 350 level the west crosscut 150 feet south of the north line is out 190 feet; face in porphyry. The west crosscut on the north line, 500 level, is out 18 feet; face in porphyry.

BALTIMORE.—The usual progress is making in the drifts and crosscuts on the 338 and 225 levels. At several points on these levels, deposits of good milling ore have been developed.

SCORPION.—On the 500 level the new east drift from the Sierra Nevada shaft is advanced 1045 feet. There is no change to report in the character of the ground.

ANDES.—Are running a drift from the winze 40 feet below the 350 level, and have started a drift from the 350 level to above the 313 level.

YELLOW JACKET.—Are shipping about 50 tons of ore daily to the Brunswick mill and prospecting the upper levels of the mine.

EAST SIERRA NEVADA.—On the 520 level the new east drift from the Sierra Nevada shaft is advanced 1045 feet.

WARD COMBINATION SHAFT.—The shaft has been repaired and is now in good condition down to the 1500 level.

NEW YORK.—The upraise in the west crosscut on the 800 level is up four feet, the roof yielding fair assays.

ALTA.—Mill in full operation and 925 level stopes yielding the same quantity and quality of ore.

Cherry Creek District.

EXCHEQUER.—White Pine *News*, Aug. 17: We learn that Salt Lake men are in Cherry Creek experting on the old Exchequer mine with a view to purchasing. The Exchequer's past record is certainly an inducement to capitalists to go below the water line.

Comet District.

BONDED.—*Silver State*, Aug. 17: E. A. Shear has bonded the Old Comet mine, and will make an effort to interest Salt Lake or other parties in the property. There is an excellent showing of low-grade ore in the mine, which the building of the proposed railroad will make it profitable from the start to extract. So far it has possessed no value on account of the expense attached to marketing it.

Seligman District.

INACTIVE.—White Pine *News*, Aug. 17: Eugene Howell, who has just returned from Seligman district, thinks nothing will be done there until all matters pertaining to the estate of the late Mr. Robinson are wound up.

Flowery District.

PROSPECTING.—Virginia *Chronicle*, Aug. 20: This morning two miners left for Flowery district to prospect in the vicinity of the Golden Prize location. They were equipped with a three months' supply of commissary stores. There are numerous small veins of gold-bearing quartz in the district that have added above a million to the wealth of the State, and as that district is fertile in mineral the prospectors are confident that they can make fair wages. A pocket struck in the Golden Prize in 1866 yielded $40,000 in gold bullion, and the space from which it was taken did not exceed 20 cubic feet.

Jumbo District.

NOT HIGH GRADE.—Virginia *Chronicle*, Aug. 20: The reports from Jumbo district are not so rose-colored as heretofore. The Dunlop five-stamp mill is not yet completed—in fact, the work of construction is suspended, for the reason that the ore now on the Wild Goose mine dump is not high enough in grade to warrant the expenditure necessary to get a supply of water for amalgamating purposes. There is water in the shaft at the mine, but it will require an expensive pumping plant to lift it to the surface, and to tap it by an adit tunnel would require cutting a length of above 3000 feet.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Aug. 17: West crosscut from the end of north drift, 250-foot level, extended 16 feet.

COMMONWEALTH.—The mine is showing well at every point. One hundred and sixteen tons of ore sent to the mill; average battery assay, $198.97. As a test, 500 tons concentrating ore have been sent to Grand Prize plant; the results obtained give satisfaction, showing that the low-grade ore can be concentrated to a high percentage. Bullion shipped during the week, $21,292.76. Crude bullion on hand, $12,000. Under instructions from the board of directors, the work of extracting ore has been suspended.

DEL MONTE.—North drift, 225-foot level, extended 15 feet. Joint crosscut, 225-foot level, extended 14 feet, the face having entered the vein, which is looking remarkably well and shows the ore to be of high grade; face still in ore. East crosscut No. 1 north, 100-foot level, extended 13 feet. The face is in very high-grade ore.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, just entering the vein, having thus far cut into a foot of good ore, much of it being high grade. Face still in ore. East crosscut No. 1 south, on the 100-foot level, extended 15 feet; total length, 202 feet. The face is still in low-grade ore.

NEVADA QUEEN.—South drift from Commonwealth, 150-foot level, has been advanced 9 feet with but little change. All work has been suspended, pending the sinking of the North Belle Isle shaft, which will open up the 550 and 650-foot levels.

GRAND PRIZE.—400-foot level: West drift, old vein, extended 23 feet. West drift from north crosscut extended 20 feet, and west crosscut from south drift extended 11 feet. Pump is running steadily and doing good work.

NAVAJO.—South drift, west, 350-foot level, extended 12 feet. Crosscut from south drift east, 350-foot level, extended 17 feet. No. 1 upraise south end, same level, extended 6 feet. The ore continues high grade.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 15 feet. The rock is a little harder in the bottom. The flow of water shows a slight increase.

ARIZONA.

NOTES.—*Journal-Miner*, Aug. 15: "Bob" Dougherty has gone out to the Bradshaw mountains to start work on the Eclipse again. Eight new concentrators have been received at the Vulture, and will be used in working over tailings from the mill. Sidney J. Cook came in Friday evening from Maple gulch, where he has been engaged in mining and milling ores, with good success, he says. He has been compelled to close down, on account of lack of water. Jacob Henkle has his tunnel on the Rapid Transit mine in on the ledge for a distance of 300 feet. The ledge is a very strong one and the ore exceptionally rich. C. M. Clark has a number of men engaged in putting the Dixie mill in readiness for a run. A sufficient quantity of ore is now on the dump to start the mill up as soon as a sufficient quantity of water supply is obtained. We understand that Tom Brown, formerly superintendent of the Tip Top mines, is to fill a similar position under the new management at Harqua Hala. A corporation is about to be formed to work a mica mine in this county. The Kansas City M. and M. Co. has let the contract to sink a 100-foot shaft on the Julia mine on Groom creek. This is one of the Rubert group. Assays were made yesterday of a lot of ore from the Occident mine, which showed a value of 15,000 ounces of silver per ton. The ore is from a new strike in the mine, made about a week ago. When the ore was first struck it was very narrow, but in going nine feet has widened out to four inches. The ledge is a parallel vein to the Peck, or by many considered to be a part of the same vein.

ORE SHIPPED.—Mohave *Miner*, Aug. 17: Frank L. Smith shipped four carloads of ore to the Rio Grande smelter this week. N. C. Amer is making a shipment of ore from the Silver King to the Rio Grande smelting works this week. The Flores mill is now running on ore from their mine, and arrangements are being made to put up a hoist, as the working is now so deep as to require one. Dan McKinnon and Barney McCall have commenced work on the Altatta, and expect to make a shipment ere long. The Empire mine in Chloride is reported as taking out some of the finest ore ever taken out in the county. There are a good many tons of the same kind of ore still in sight. At the sampling works the following lots were worked during the week: N. C. Amer, small lot of high-grade ore; W. W. Clack, three tons from C. O. D.; Robinson & Harris and Opie & Martin, lessees on C. O. D.; each had small lots worked, all high grade. The weather has been so warm during the past month that the prospectors and miners are doing only what work they are compelled to do. With the cool weather, which it now seems has set in, work will be again fully resumed.

COLORADO.

CONEJOS CAMP.—Denver *Republican*, Aug. 15: J. D. McCarthy, a well-known mine-owner and promoter, has just returned from what is generally known as Conejos Camp, a few miles up in the mountains from Alamosa. From the reports he brings to the city, this district is destined to play an important part in the total production of the State in precious metals in a few years. He says that the Mammoth mine, a property in which he is interested, has a carload of ore on the way to Denver which, according to samples made, will average close on to $600 per ton, and before the month is over 20 more tons will have been mined and settled for. While at Carson Camp Mr. McCarthy bought the Holy Moses and Lone Hand locations. The Merrimac M. Co. is doing considerable work in this district, the results of which are so far most satisfactory to the management. The Ute mining district, in which all these claims are located, is a region which it will pay intending buyers and promoters to watch with care. The ore found is of an exceedingly high grade, and seems to occur in sufficient quantities to make it highly profitable.

DAKOTA.

IRON HILL.—Black Hills *Pioneer*, Aug. 15: Contractor Damon has finished burning 52,000 of the 100,000 brick he agreed to furnish the Iron Hill Mining Company at Carbonate. The others are in the kiln now, and will be delivered as soon as practicable. The smelter continues running smoothly and satisfactorily.

SOPHY LODE.—Oscar Waller came in from Carbonate yesterday, where he has just completed assessment work on the Sophy, lying east of and close to the Spanish R. The property belongs to Waller and Hann. Work just completed served to disclose a ledge of very good ore.

PLUMA MILL.—The Pluma mill is still pounding away on ore from the Big Missouri mine. Run on this ore will probably continue through the month.

IDAHO.

THE HOPE CLAIM.—Wood River *Times*, Aug. 17: After five months of indefatigable efforts and under very discouraging circumstances, Delius & Thompson have at last struck it rich in their lower tunnel, which is driven to a depth of 475 feet from the surface. They cut into the vein three or four days ago, and have found it to be 17 feet 6 inches from wall to wall and all ore. The ore is of two classes, free and concentrating The concentrations, ten tons in one, assay from $125 to $1000 per ton. The free ore assays from $15 to $30, on an average, but some of it goes $200 and over. Thirty tons of the ore run through at the Deer Creek mill, two months ago, yielded an average of $17 per ton. The Hope claim is located in Croesus gulch about two miles west of Hailey.

IDAHO.—*Statesman*, Aug. 15: The Idaho G. M. & M. Co. has been recently organized in Boston. The object of this company is to develop some gold quartz in the Leesburg district, Lemhi county. Charles F. Blackburn is the superintendent and general manager of the mines. The other officers are prominent business men in Boston. The company is capitalized at $300,000—30,000 shares at a par value of $10 each; stock non-assessable. One-third, or 10,000 shares of the capital stock, is being sold in Boston for working capital to develop the mines. Mr. Blackburn hopes to begin work in the near future, and is confident of making a bonanza out of these gold ledges.

BUFFALO.—Idaho *World*, Aug. 17: Harry Smith has made a piece of road from the old Buffalo mine to connect with the main road to Morrell's mill, in Lewis' gulch. The Buffalo was worked many years ago, but no ore from it was ever milled. There is a pile of ore on the dump—one hundred tons or thereabouts—that Smith has had assayed and believes will pay. He will soon have some of it crushed. The Buffalo is at the head of Wet Gulch.

CROWN POINT.—Work will soon begin in the tunnel on the west extension of the Crown Point mine, at Banner. This claim is owned by J. C. Fox, Ritchie Bros., Dunc Ferguson and others. The tunnel is in 280 feet, and is not more than 40 feet from the ledge. Work will be pushed ahead to tap the vein. The ore of this location prospects well at the surface.

A STRIKE.—*Idaho Recorder*, Aug. 15: A strike was recently made in the lower tunnel of the Kentuck mine at Shoup, disclosing a larger body of ore than ever seen before in even this famous producer of the yellow metal.

LOWER CALIFORNIA.

A TEN-STAMP MILL.—*Lower Californian*, Aug. 15: Capt. W. M. Baines arrived from San Diego Tuesday morning after an absence of several weeks, during which time he made a trip to St. Louis and Chicago. In the latter city he purchased a ten-stamp mill with 850-pound stamps, and fitted with all the modern improvements for saving flour gold; also a Blake crusher and an automatic feeder. The machinery was purchased from Frazer & Chalmers. All the machinery is being freighted via Tia Juana, and the mill as laid down at the mines will cost not less than $20,000. The El Paso Mining Co. owns four mines at Alamo—the Texas, El Paso, Annie and Avalina. They are generally conceded to be among the richest in the district. Recent developments in the Annie, which lies between the International Co.'s Iron Mask and Iron Vein, have attracted much attention and placed it in the first rank. The mill will be running in full blast on the company's mines within 25 days, turning out three tons a day per stamp. No custom milling will be done.

MONTANA.

AT ARGENTA.—*Inter-Mountain*, Aug. 15: Alex. B. Allen, secretary of the P. J. Kelley Quartz and Placer Mining Company of Argenta, reports his company progressing rapidly with its operations on Rattlesnake creek near Argenta. A 60-ton smelter has been purchased of Fraser & Chalmers of Salt Lake City, and the company expects to have it in operation by the first of September. Next spring they calculate to add two more smelters of 60 tons capacity each, to the plant, thereby making their reduction capacity 120 tons per day. Mr. Allen states that development has been pushed on the properties, and that sufficient ore is now in sight to run works of the above-mentioned capacity for five years. Development work has also been pushed on the company's placer ground, and it will be in shape to be worked extensively next spring. The scarcity of water has delayed the placer operations considerably, but the company expects to get about a month's washing yet this fall. The Clark smelter at Argenta Mr. Allen reports in full operation and working successfully. The entire camp is lively, and new discoveries are being constantly reported. The ore is silver-lead carbonates, high grade, and easy to treat, requiring no fluxing. Mr. Allen thinks Argenta has a bright future before it.

NEW MEXICO.

AZTEC.—Sierra City *Enterprise*, Aug. 16: The Aztec company is laying a pipe to connect its mill with the water works. It was thought at first that the wells sunk near the mill would furnish a sufficient supply, but it has been found inadequate during the dry season. John M. Wright is running a tunnel in on the Mountain View lead of the Santo Domingo claim. The tunnel is several hundred feet from the shaft of the Mountain View from which the rich ore has been taken, but the vein is the same. Utter & Lewis have commenced running a tunnel in on the Grand Tower at Gold Hill. What Gold Hill needs now is a good custom-mill. Hank Dorsey is in from the Greenlee district near Clifton, bringing a bottle full of coarse gold washed from some of his mines. The dirt paid at the rate of $1 per pan, but Mr. Dorsey was compelled to carry dirt more than a mile on his back to water. Hank is satisfied that the placers will yield a large amount of money, but it will require the investment of some capital to make it profitable. On Wednesday Miller Bros. & Dodd, owners of the Alhambra, made the richest shipment of ore ever made from this city. One thousand pounds were sent by express, which it is expected will average $10 per pound, and three tons were sent by freight, which will probably run from $1000 to $1500 per ton. A large per cent of the ore sent by express is over one-half pure silver, while some specimens could be picked out containing almost as much pure silver as a coined dollar. The traction engine, which will soon be put to work hauling ore for the Pacific and Aztec companies, arrived on Monday.

PINOS ALTOS DISTRICT.—*Southwest Sentinel*, Aug. 13: The Mountain Key belongs to the Pacific or Aztec group. Ninety men are employed here on the second, third and fourth levels, under the direction of Supt. John Boyle Jr., and Capt. Pritchard. The Mountain Key vein carries a width of from 6 to 15 inches from second to fourth levels, and gives evidence of widening as it descends. Indeed the miners will not feel at all surprised if in the fifth level, which will shortly be started, the vein attains a width of fully 20 inches. The spreading out of the deposit in its downward course does not decrease the value of the ore as is the fact at some mines visited, but on the contrary in the case of the Mountain Key the product becomes much richer. The Co.'s mill on Bear creek, near by, is kept running steadily on the product of the mine.

THE AZTEC MINE.—This is situated on what at first appears to be the Mountain Key vein, owing first to the striking similarity of the formation, and secondly, to the course of the lead at its mountain base. The fourth level has been reached, where work is principally confined at present on three parallel veins, which we will designate as Nos. 1, 2 and 3. No. 1 averages about eight inches in width, carries sulphurets of iron lead and zinc, and is formed in granite. No. 2 courses 56 feet west of No. 1, is slightly larger, and formed in hard granitic syanite, though in chutes of ore; in this there is a casing of soft slate which makes mining easy. The formation of No. 3 is identical with No. 2, where the vein is yet larger and the ore of a higher grade, and also contains chutes of soft mineralized slate. Capt. J. S. Tonkins is in charge and handles the workings, in which 60 men are employed, in an intelligent manner.

SUSPENSION.—The Night Bird will be started up this week. In accordance with instructions from the St. Louis people, work was entirely suspended at the Thunderbolt property on last Friday evening. The shaft had reached a depth of 100 feet, the small lead grew no larger, water became more troublesome, and thus a total suspension of operations was ordered. The men employed here have gone to work on the Smith & Ailman property.

OREGON.

CRACKER CITY.—Baker City *Democrat*, Aug. 14: Our reporter visited the scene of operations of the Eureka & Excelsior Mining Co., about one-half mile above the town, and was shown, first, through the tunnel of the Excelsior, a distance of 700 feet. Starting at the entrance of the tunnel, one continuous vein of ore is followed the entire distance, the ledge at its narrowest place being 18 inches and that for only a short distance, and from that up to 12 feet wide, showing rich black sulphurets and assayed every ten feet the entire distance of the tunnel. About 500 feet in the tunnel of the Excelsior is an upraise to the surface a distance of 250 feet as straight as an arrow following the ore vein the entire distance. In the crosscuts in several places the vein is exposed 12 feet in width between walls, and in the face of the tunnel a ledge six feet in width is found of the richest sulphurets. The same may be said of the Eureka, on the opposite side of the creek. The tunnel is in over 600 feet, and the same immense bodies of ore are to be found. There is no doubt but that the company will be compelled to add another 20 stamps more to their mill plant before many days after its completion. Until the reporter's visit to the scene of operations of the E. & E. Gold Mining Co., he had only a faint idea of what was really transpiring there, and the extent of the company's work cannot be realized by any one save by witnessing it. It is simply wonderful. There, between two almost perpendicular mountains, rising thousands of feet above the level of the sea, thickly timbered, is where the large mill plant is to be erected. Upward of 150 men are employed on the work, and it is progressing rapidly. The expense attending the company's work must necessarily be enormous, their pay-roll reaching in the neighborhood of $16,000 per month, but they are fully justified in the outlay; and as soon as their mill is completed, which is expected to be not later than December, it will be kept pounding on ore indefinitely.

MECHANICAL PROGRESS.

Nail Manufacture.

The introduction of the wire nail has been the cause of much disturbance and a great falling off in cut-nail manufacture. This falling off has been due in a large measure to several most unbusiness-like mistakes on the part of the cut-nail manufacturers. In the first place, the disagreements between the cut-nail manufacturers and their workmen in 1885 was a short-sighted policy at that time, as it afforded just the opportunity for the introduction and sale of wire nails—a product which for several years previously had been striving to gain a foothold in the market, but without success, until their rivals kindly closed the doors of the cut-nail manufactories for a period of nearly one year. The opportunity was quickly seized and the sales of wire nails rose from a few hundred thousand kegs in 1884 to 1,500,000 kegs in 1888. This result was brought about all the more readily from the fact that wire nails to do the same work were from 20 to 25 per cent lighter than cut nails. Moreover, during the lock-out the manufacturers largely increased the number of their machines.

Other Mistakes

Moreover, just about this time they were changing from iron (the weaker metal) to steel (the stronger one). Common sense would seem to have suggested the very practicable idea of reducing the weight of the nail proportionately to the improvement in the metal, and thereby have wiped out the difference in weight between the cut and wire nail. This would have been business-like and in the way of true progress. The benefit derived from the greater number to the pound would have more than offset the naturally slight increase of cost in making the lighter nail and cheapened the product to the consumer.

Coming to Their Senses.

But recently, after several years of waiting, the manufacturers are coming to their senses, as we learn from a Pittsburg journal, which says: "At a recent meeting held at Wheeling, the Western Cut Nail Association, by a formal vote, decided to reduce the size of the cut nail, in order to make it weigh as near the number per pound of the wire nail as practicable without impairing its effectiveness or diminishing its holding qualities. Specimens were sent by six different wire-nail factories and the association made up their estimates by actual weight."

This step has been taken to make headway against the rapid encroachments of the wire nail. Steel nails in future will be practically cut the same gauge as wire nails, so that they shall count as many to the pound, and thus, it is hoped, take away the chief argument of the wire nail. It is felt to be a last resort, and the die is cast for the steel nail to stop further incursions of its enemy, or else its own doom is sealed.

It is not difficult, says another cotemporary, to foresee several effects which must result from this policy. One will be the necessity of raising the base price, in consequence of the increased cost in cutting, and also a revision of extras. This last has been set for consideration at a special meeting on July 24th. Whether the adoption of new gauges will be universal, and whether the new nails will give satisfaction, will have to be tested by time. Meanwhile it is interesting to contrast the attitude of the two classes of manufacturers. The wire-nail men are calmly confident, pursuing their way without any regard for their adversaries or their doings, and hopeful for the future. On the other hand, the steel-nail men are full of anxiety for what is to come, and devising one expedient after another to restore their lost supremacy.

If the manufacturers had convened en masse, and formally resolved to ruin their business, they could hardly have devised a policy which would have been more effectual for their purpose than that which has been pursued. The action of the cut-nail manufacturers must be regarded as most unwise. In their contests with their workmen they fairly overreached themselves, and to the cost of both the employer and employed. Employers must deal fairly with the employed. This is one of the essentials which mark the advance of modern progress. Their failure to take a plainly obvious step to cheapen the cost of their goods to the people without cost to themselves or their employes, was unwise and unbusiness-like. And now that they appear to have become aware of their mistakes in the past, it behooves them to act promptly in adjusting themselves to the new conditions of the nail industry, and thus place themselves in the line of true progress.

A New Nail Machine.

In connection with the above we would call attention to a new nail machine which has recently been perfected, and which is warranted to make at half speed, 12,000 nails a minute, or three tons per diem. The inventor is a New Englander, and the process is said to be of the simplest description. Instead of the ordinary shear-like cutters heretofore employed, the latter consists of small sheet dies imbedded in two narrow cylindrical rollers, having the appearance of cogged wheels. The strips of iron or steel being fed between the rollers and the dies or cogs, cutting the nails at the rate above. Movable steel teeth placed between the cogs are forced toward the center of the cylinder, to the point of contact with the dies, and in the course of the revolution come in contact with a steel shaft which pushes them upward, and forces the nails from between the cutters, whence they drop into a spout or conductor. Another feature is that by means of a single leverage system of inclined planes acted on by screws, the cylinders can be adjusted in their relations to each other to the ten thousandth part of an inch. The dies are replacable, and can be ground without being removed from the cylinder.

IMPROVED METALLIC PROCESS.—By a new and interesting process zinc is now applied to iron in such a manner as to prevent liability of the zinc becoming detached, besides imparting to the metal the property of taking a polish or being galvanized with any desired metallic coloring. In accomplishing this result the iron is first cleaned by being subjected to the action of a mordant, after which it is drawn through a solution of chloride of zinc, a little ammonia is thrown upon it and it is immersed in the zinc bath. The apparatus for this purpose is placed near the heating appliance, being so constructed that two rotating cylinder brushes are placed over the vessel containing the zinc, and can be brought nearer to or removed from each other in a horizontal position, even during their rotation. When the iron plate is to be placed in the zinc bath, the brushes are moved sufficiently far apart to allow of this being easily done. The iron remains in the bath until it has assumed the temperature of the contents; the metal is then lifted out of the bath sufficiently for its upper portion to reach the middle of the steel cylindrical brushes, which are put into rotary motion by the mechanism, and are brought so near each other that both sides of the metal are subjected to their action. Their velocity is regulated by their distance from the surface of the zinc bath and by the thickness of the metal to be treated. The superfluous zinc is removed by the brushes while in a soft condition, so that only the clean zinc alloyed layer is visible after the operation. This layer is not a coating of zinc, but is the original surface of the iron, and therefore inseparable from it. Not only does it perfectly resist all influences of temperature, but it can be heated without injuring the layer of iron and zinc alloy.—*Ohio Valley Manufacturer.*

A BAND SAW FOR METALS.—English machine shops make use of a tool which is but little used in America. It is a band saw for metals. Its construction is similar to that of a heavy band saw, with a third carrying wheel for the saw, the object of which is to remove the upmoving side of the blade from the vicinity of the table, and thus leave a deep throat through which a large piece of work can be passed or a wide plate turned. This third wheel is placed at the back of the machine, about midway in the vertical hight of the saw blade. The temper of the saw is slightly harder than that of those used for wood. The teeth are sharpened straight across the blade by a cutter, with its teeth at the right hight to suit the teeth of the saw blade. This tool is used to cut off the spines from steel castings, the ends of bolts, to saw up steel, iron and copper plates to any form, and to rough out the jaws of eccentric rods and other forgings which would require the use of slotting machines. It cuts as well on a circle as upon a straight line. The blade is lubricated with soap and water, and in a cut six inches long through a steel connecting-rod jaw it works freely and satisfactorily. Not infrequently circular saws of large dimensions are used for the same purpose, and, being mounted on heavy frames and fed carefully up to their work, cut off large pieces of steel, leaving nearly a smooth surface on the face of the cut. A saw similar to the above is now in operation at the shops of the Yale & Towne Manufacturing Company at Stamford, Conn.

SOUTHERN IRON.—There are, at the present time, about 25 furnaces in full blast in Alabama, turning out pig iron from $3 to $4 a ton cheaper than it can be turned out in Pennsylvania. Although the Southern iron men are not trying to undermine or break down those of the North, and don't expect to do anything of the kind, still they are receiving large orders from the North and nearly all other parts of the Union. The South has its advantage of cheaper labor, abundant, excellent and convenient ore; but the North has a big advantage in the way of markets, and there is room for both in the field. The whole number of furnaces in blast in the entire Union is about 290. There are 24 States in the Union which produce pig iron. The Southern iron-producing States are Maryland, Virginia, Alabama, West Virginia, Tennessee, Kentucky, Missouri, North Carolina, Georgia and Texas.

THE COST OF FUEL per locomotive per year on the Pennsylvania system may be taken in round numbers at $2000. Fifteen per cent of this—the saving claimed in a paper recently read before the Institution of Civil Engineers for the compound system—is $300, a sum, the *Railroad and Engineering Journal* says, which it would be very easy to absorb in the maintenance of additional or more complex parts, or by the loss of service of the engine.

IRON CASTINGS 100 years ago sold for $110 to $150 per ton, pig iron for $152 per ton, and sheet iron for $300 per ton; nail rods were worth $165 per ton, and nails were worth from 16 to 19 cents per pound.

SCIENTIFIC PROGRESS.

Novel Experiments on Light and Electricity.

The following interesting record is from the London *Electrician:* "An experiment described by M. J. Borgman has an important bearing upon the explanation of the remarkable discovery of M. Hallwachs, in which a beam of light seems to act as a conductor for an electric current. The latter experiment consisted in placing a piece of metallic gauze parallel with, but insulated from, a second sheet of metal. The first is connected with the positive, the second with the negative, pole of a battery, and in one of the leads a delicate galvanometer is placed. If, now, a beam of light be made to pass through the gauze, and to fall on the plate behind, a current is set up in the circuit, and continues to flow as long as the illumination is maintained. It has, moreover, been shown that the action is due to the ultra-violet waves. Now, M. Borgman wanted to ascertain whether or not the effect was instantaneous; that is to say, whether the commencement and cessation of the current was or was not simultaneous with that of the illumination. M. Borgman probably reasoned that, if the beam acted in some sense as a conductor of the current, the effect must be instantaneous; while if the phenomenon resulted from some secondary action, it would probably go on increasing up to a certain point with the duration of the illumination, and it would also probably continue for a time after the light had been cut off. His method of making the test was equally simple and ingenious. The light was interrupted at rapid intervals by means of a rotating disk with holes or slits, and he placed a telephone in circuit with the battery. It is, then, obvious that, if the effect is instantaneous, the telephone will produce a note corresponding in pitch to the velocity of the disk; if otherwise, there will be silence. There was silence. A make and break in any other part of the circuit could be heard, but not in the beam of light; hence we must seek for some secondary action on the surface of the plates to explain M. Hallwach's experiments."

ELECTRO-MAGNETIC DISTURBANCES have occurred simultaneously with certain sun disturbances observed through the telescope. Evidently the electro-magnetic force traveled from the sun to the earth with the velocity of light. Twenty years ago Clerk Maxwell asserted that light was an electro-magnetic wave movement. Following out Clerk Maxwell's suggestion, an interesting series of experiments have recently been made by Prof. Hertz of Brown University, which show that electro-dynamic force is, like light, a wave motion, propagated through ether, and, like light, subject to reflection, refraction, and concentration by means of lenses. Prof. Hertz's experiments were based on the variations of an induction current at various distances from a metal wall, reflecting the primary current; based in fact on the well-known phenomena of wave interference, and they show the length of an electro-dynamic ether wave to be 1 72 m., its velocity through space to be 300,000 m. per second, or identical with that of light. By means of a metal reflector, electro-dynamic waves were focused, some substances, such as wood, being transparent, others, such as metal, being opaque, and casting electro-dynamic shadows. A huge prism of tar, weighing 1200 pounds, showed that the laws of refraction are analogous to those of light. Almost infinitesimally short vibrations of ether manifest themselves to us as chemical action, longer ones as light, still longer waves as heat, and these very long waves as electro-dynamic force. Electro-dynamic force is the low and fundamental base of which light and heat and chemical action are the high treble. Gravitation and other mysterious forces may yet be shown to be wave lengths in the middle register. Practical applications will undoubtedly be made of this new control over electro-dynamic forces possibly as important as those of the telescope, microscope, and spectroscope over light.

LONG RANGE TELEPHONING.—During the recent civic and military processions in New York, the music of the bands, the ringing of the church bells and the whistles of the steamboats were heard by a lady in Philadelphia. This may seem almost incredible, but we have it on good authority that this actually occurred. The lady in question takes press news over the long-distance telephone, and, in order to facilitate matters and aid her in hearing distinctly the dictation of the news-sender at the other end, she wears a metal cap, attached to which is a receiver that passes close to her left ear. Monday, during the naval pageant that welcomed the arrival of the President, she distinctly heard the whistles of the steam craft, the roar of the artillery, and the chimes of Trinity bells. Tuesday, during the progress of the military procession, strains of music from the various bands and the shouts and hurrahs of the witnessing crowds were plainly borne to her ears.

INCREASE OF TRACTION BY THE ELECTRIC CURRENT.—It has been a matter to some extent in dispute whether or not the passage of an electric current between the wheels of a motor and the rails, increases the adhesion available for traction. In a recent issue of *Electric Power* is a brief account of a demonstration recently made in Washington. The experiment was conducted by Mr. Joseph Lyons. A pair of wooden strips were connected to form a frame, and a pair of short parallel strips of sheet iron, set up edgewise, secured to the frame, and a toy electric motor was arranged to move the miniature truck along the sheet-iron rails. The experiment consisted in closing the motor circuit, and then lifting the forward end of the frame until the grade was such that the motor could not climb it, that is, until the adhesion due to the weight of the motor was not sufficient to overcome gravity. On closing an independent circuit through the rails and truck-wheels and shaft, the motor would start again up grade and travel a considerable distance. There was no mistaking the action of the motor. It was positive and pronounced, "like the scramble of an army mule," under the traditional stimulus. Mr. Lyons estimated the increase of traction at about 40 per cent.

CONVERTING INORGANIC INTO ORGANIC SUBSTANCES.—To say that iron can be converted into food sounds like nonsense. To say that the constituents of food can be extracted from iron, and the iron be thereby made more valuable than before, sounds like greater nonsense still. But Mr. A. B. Griffiths, in a recently published treatise on manures, tells us that both these things are so. The process of converting iron into Bessemer steel, Mr. Griffiths says, results in the elimination of a basic slag, containing from 14 to 20 per cent of phosphoric acid. Reduced to an impalpable powder, this slag forms a valuable manure, being readily assimilated by plants. He tells us that about 350,000 tons of this slag are annually produced at the various Bessemer converting establishments in England, and that its use as manure would produce at least 4,000,000 tons of hay, or sufficient for the feeding of 750,000 head of cattle. What a lot of things kindly Nature would do for us, if we would only let her have the chance. It's a rich storehouse we have at our command, if only we had sense enough to throw the doors open.

ESTIMATING COPPER ELECTROLYTICALLY.—In estimating copper electrolytically, Herr F. Rudorff says: "It is advantageous to acidify the solution with nitric acid; but when chlorides are present considerable time is taken up in evaporating the solution with sulphuric acid." He found that when an ammoniacal copper solution is electrolyzed the metal separates in a spongy condition, but that if two to three grammes of ammonia or potassium nitrate be added, and then about 10 cc. of ammonia for every 100 cc. of the solution containing 0.1—0.3 grammes of metal, the latter separates in excellent condition, even when the strength of current employed varies between considerable limits. The operation is ended when the solution has become colorless.

MANNESMANN STEEL-TUBE PROCESS.—The Mannesmann process of manufacturing steel tubes by rolling is now pretty well known in this country, and by it it is easy to form a cylinder closed at both ends, in which case the interior of the tube, on cutting into it, is found to be full of some gas. This gas has recently been analyzed, with the result that it was found to consist of 99 per cent of hydrogen and one per cent of nitrogen. The steel which was made was found to have the following composition in parts per 100: Carbon, 46; silicon, 25; phosphorus, 0.22; sulphur, 0.1; manganese, 23; with traces of copper.

PECULIARITIES OF VISION IN INSECTS.—A correspondent to *Le Naturaliste*, referring to the curious fact that neither flies nor wasps will venture to pass through a window across which a piece of fish-net is stretched, asserts that the phenomenon is due to the confused vision possessed by insects. The threads of the net give them the impression of a continuous surface, just as with us do the hatchings of an engraving that we look at from a distance. The animal believes itself to be in front of a more or less translucent obstacle, but one in which it distinguishes no orifices.

WHEN THE DEAF CAN HEAR.—It has been discovered that a man severely afflicted with deafness can hear when riding in a rumbling car. The philosophy of the phenomenon has been stated by an aurist as follows: "It is due to the counteraction of the noisy motion on the drum of the ear. The rumble of the heavy wheel on the track causes the drum to vibrate, and the afflicted one can hear quite plainly. Some people think that they ought to voluntarily raise their voices in a car. That is not so. Always speak in a low voice to a deaf person in a moving car or vehicle."

MANGANESE has a high melting point, but fuses when exposed to the heat of a good wind-furnace. It has a strong attraction for oxygen, and will even take it from the water at a low temperature. A variety of bronze containing manganese is highly esteemed.

MEDICAL SCIENCE has of late made no more important discovery than that consumption is not an inherited disease, but may be transferred by means of a germ or microbe from the sick to the healthy.

SPECTRUM ANALYSIS.—The oxygen band in the spectrum of the electric light from the Effel Tower was, at a point five miles distant, found to be similar to that in the sun's rays.

Good Health.

Health of the State for July.

It appears from the report of the State Board of Health for July that that month shows the smallest death rate of the year. Reports from 100 cities and towns, with an estimated population of 803,550, give the number of deaths as 897, which is a percentage of 1.11 per 1000 in the month, or an annual mortality of 13.32. It indicates an entire absence of epidemic disease of a fatal character, and a general condition of healthfulness throughout the State, which speaks louder than words.

Reports received indicate a remarkable absence of zymotic diseases. All observers agree that a general mildness of type characterized the sickness which had come under their notice, which will, perhaps, in a measure account for the limited mortality recorded during the month. As might be expected, the most prevalent of all disorders of the system were those affecting the stomach and bowels, and this was particularly noticed during and after the very warm days that were experienced in the earlier and latter part of the month.

Consumption, which enters so largely into our mortality returns, was fatal in 129 cases, which is below the monthly average. Pneumonia had a mortality of 38, of which number 23 occurred in San Francisco.

Cancer, in regard to which so little attention is paid by the medical faculty, shows a mortality of 21, ten of which occurred in this city. This malady still holds its place as the fifth on the list of fatal diseases. Typhoid fever is reported to have caused 29 deaths—a slight decrease from the June report. As this is the season of the year, says the report, when typhoid fever is most likely to prevail, and thereby increase the chances of the contamination of our drinking water, and as it is also at this time that visitors leave the warm valleys to seek health and recreation at the various mountain and seaside resorts, we cannot too earnestly advise such sojourners to criticise keenly the sanitary surroundings of the place in which they propose to spend their summer holiday; examine the outhouses and privies; see where the sewage is conveyed and deposited; note the proximity of the closets to the well, and if the well is a dug one, and within 300 feet of the sewer, cesspool or privy, do not drink the water from such well except you know it to be boiled. In short, avoid all summer resorts where cleanliness and sanitation is not the rule, where every outhouse, privy and cesspool is not deodorized and disinfected as regularly as the week comes round. Without this, danger is ever present, and we firmly believe that more typhoid fever is contracted in these insalubrious country houses, whose portals we seek for health, than the public is aware of. The frequent proximity of cow-yards, hen-roosts, and even pig-pens, makes the surrounding atmosphere anything but salubrious. It is, therefore, an act of prudence to study the sanitary surroundings of a pleasure resort before incurring the exposure, and perhaps fatal danger, which unsanitary conditions always present.

Heart Diseases.

The State Board of Health Report for July charges "heart diseases" with 84 out of the total number of 877 deaths reported. This is certainly a very large proportion to be laid at the door of "weak hearts." Perhaps the following remarks, which we clip from an Eastern exchange, under the head of "Weak Hearts," may have some interest in this connection:

A weak heart seems to be decidedly more practically inconvenient than a weak head. If a man or woman be a little feeble about the region of the brain, it is generally of little moment. Some post or other will be provided if the conduct be respectable; and lack of brains is too common to excite any particular attention either in the person concerned or in those about him. But a weak heart insists upon putting itself in evidence at all sorts of convenient and inconvenient times. If its possessor finds himself rather late for his morning train, and makes a "spurt" to recover lost time, the exertion is usually followed by such a "bad quarter of an hour" that he resolves in future rather to lose a dozen trains than to risk temporary suffocation or permanent syncope again. The practical evils which are associated with a feeble heart are innumerable, and will readily suggest themselves to those who possess so unsatisfactory a pumping engine.

Weak hearts are by no means so common as is often supposed. Many a man who thinks he has got one is merely dyspeptic; many a woman owes her symptoms to tight lacing or insufficient feeding. If the dyspepsia be cured, or the tight lacing be dispensed with, the symptoms of heart weakness will disappear. Even when the heart is genuinely "weak," the weakness is not always due to special disease of that organ. It may be only part of a general weakness of the whole system, which is easily curable.

The late Sir Robert Christison, one of the most eminent of British physicians, used to smile at certain persons who were always complaining of weak hearts. "Gentlemen," he would say to his students when lecturing on digitalis, "gentlemen, the best tonic for a weak heart is a good brisk walk." Not a doubt of it. The majority of weak, flabby hearts are weak and flabby because every other muscle in the body is weak and flabby, and this general weakness and flabbiness is due to want of vigorous use. Exercise of the legs and back and arms gives additional and much-needed exercise to the heart, and the heart grows strong by vigorous exercise exactly as every other muscular organ does, for the heart is a muscle. If a man has no organic disease of the heart, no enlargement, and no functional disorder, plenty of brisk walking, with occasional running, will soon dispel his breathlessness and heart weakness, other things being equal. The muscular inactivity of the modern town man is the parent of more ill-health than any other single cause whatever.

Some Helps to Health.—William Blaikie, the author of "How to Get Strong," says that it is the little things which often turn the scale for or against health, and he gives the three following little helps which any one can practice and profit by: 1. To hold the body erect, whether standing, sitting or walking, and breathe deeply. This habit gives the lungs and digestive organs free play. More oxygen is taken into the blood, and the food is more readily digested and assimilated. 2. To fill the lungs full at frequent intervals, holding the air in the chest as long as is comfortable. This practice will soon improve a disturbed circulation. 3. To masticate the food thoroughly and secure a period of rest after each meal. Most thin people, he says, "do not keep still enough, do not take matters leisurely, and do not rest enough; while, if their work is muscular, they do too much daily in proportion to their strength." Thin people especially need to habituate themselves to deep abdominal breathing, as it aids greatly in digestion and promotes the vigor and health of many of the vital organs.

Corn-Silk for Dropsy.—It is not generally known that the silk on an ear of green corn is a powerful and efficient remedy for dropsy, for bladder troubles and diseases of the kidneys. In the Louisville *Medical News* we find an account of the medical properties of corn-silk and the cures that have been effected by its use. The way to use it is to take two double-handfuls of fresh corn-silk and boil in two gallons of water until but a gallon remains. Add sugar to make a syrup. Drink a tumblerful of this thrice daily, and it will relieve dropsy by increasing the flow of urine. Other diseases of the bladder and kidneys are benefited by the remedy, which is prompt, efficient and grateful to the stomach. The treatment can be continued for months without danger or inconvenience.

Maguey Plant Leaves.—What seems to be a reliable account of a case of hydrophobia, caused by eating the leaves of the maguey plant, is going the rounds of the Mexican press.

Useful Information.

Facts About the Feet.

The ideal foot of modern ladies is about a No. 3.

The common unit of lineal measure, a foot, was derived from the length of the human foot.

In a man 5 feet 11 inches tall, the foot measured 10½ inches, and the middle toe 2½ inches.

In Chinese subjects, the ordinary hight being five feet, the length of the foot was nine inches and five lines.

The longest foot of measure is that of old Turin, which is equal to 20 inches of English measure.

There was a time when not only each country but each town had a foot-measure of its own, indicating different averages of the different feet in various localities.

Among a tribe of low-stature Indians, whose hight varied from 5 feet 1 inch to 5 feet 3 inches, the length of the feet was found to be from 9 inches 4 lines to 9 inches 6 lines.

In order to get an idea of the length of shoe sizes in inches, it may be stated that a foot measuring 10 inches, with the weight of the body resting upon it, may comfortably wear a 6 shoe.

A youth in the South Sea islands, 6 feet 7 inches in hight, had a foot 12½ inches long. His lower extremities measured 38 inches in length, circumference of calf of leg 17½ inches, and his ankle 10 inches.

Incense.—Few know what is really used to produce the clouds of fragrant smoke, known as incense, in churches, says the St. Louis *Globe Democrat*. The odoriferous gum that goes by the name of incense, or gum olibanum, is a resinous gum produced by the Boswellia serrata or thurifera, a tall tree growing in the mountainous parts of India and belonging to the Terebinth family. The leaves, which grow at the end of the branches, are in ten pairs: Oblong, alternate, pubescent. The flowers are small and green, and in clusters smaller than the leaves. Each flower has five petals and ten stamens. The seed case is three-sided and has three divisions, each containing three seeds. The resinous fluid that exudes from the trunk and hardens rapidly is the incense. It forms in hard, semi-transparent, reddish or yellow drops, about the size of a pea. Incisions are made in the trunk to increase the flow. An inferior incense comes from Africa, produced also by a tree of the same family. Incense was highly esteemed in ancient times, and was used in the worship of many countries. The "thus," or incense, of the Hebrews and Greeks was the "styrax" of Arabia. Some ascribe the use of incense among the primitive Christians to the necessity of purifying the air in the catacombs and other subterranean places where they were forced to worship.

Thick Skins.—The whale, which belongs to the mammalia, no doubt holds the palm for thickness of skin. At some parts of the body the skin is only two inches thick, but in many places its pelt is fully two feet in thickness. The skin of the whale is the substance usually known as blubber, and in a large specimen will weigh altogether more than 30 tons. The distinction of being the thickest-skinned quadruped belongs to the Indian rhinoceros, whose hide has a knotty or granulated surface, and is so impenetrable as to resist the claws of the lion or tiger, the sword, or the balls of the old-fashioned musket. So stiff and hard is the skin that were it not divided by creases or folds the animal imprisoned in its armor could scarcely move. It is manufactured into leather of great strength and durability, and targets and shields are made of it that are absolutely proof against darts or sword strokes. The skin of the hippopotamus runs that of the rhinoceros very closely as regards thickness. When dried it is also used for shields, which are highly prized by the natives.

Burned Clay for Railroad Ballast.—The use of burnt-clay ballast is rapidly increasing among the railroads of the West. The Chicago, Burlington & Quincy railroad have a large amount in use on their lines in Iowa, and their officers are said to prefer it to gravel or broken stone. The Iowa Clay Ballast Company of Kansas City have a large contract on the Burlington and have done a good deal of work on the Rock Island road. They furnish the ballast to the Burlington Company, burnt and loaded, the company furnishing the coal and transportation, for 50 cents a yard, and the total cost when under the track, everything included, is figured at 94¼ cents per yard, compared with about $1 25 per yard for stone ballast. On the Rock Island road the cost is figured at about 63 cents per yard, burnt and loaded.

The Mammoth Sugar Refinery of Claus Spreckels at Philadelphia is now being equipped with its apparatus. The steam plant consists of 30 Babcock & Wilcox boilers, which are located on the first and second floors of the building. Each boiler is fired by a pair of Roney mechanical stokers, making 60 stokers in all. The stoker plant is so arranged that the coal is handled mechanically, and without manual labor of any kind, from the time the car of coal is dumped until the ashes are shot into the ash vault. Mr. Spreckels has thus far contracted for 31 Westinghouse engines as a part of the power plant. This will be the largest and best-equipped sugar refinery in the world.

The Oldest Steamer in the World is lying in Bowling Harbor, on the Clyde. The Industry, built in 1814, plied for 60 years on the Clyde, and was finally laid up where she now lies. Last year the engine, a side-lever one, with spur-wheel gearing, was taken out and placed in the Kelvinside Park at Glasgow. The old boat is fast breaking up, and will doubtless shortly disappear. The engine, however, will show to future engineers what a side-lever engine was like, and how it was connected by gearing to the paddle shaft.

Curious Tree Growth.—Growing out of the masonry of the French Catholic Church steeple in Biddeford, Me., almost at the upper limit of the brickwork, are two young trees. Both are green and healthy looking, and have grown rapidly within a year. They are beyond reach from the upper window, and could not be removed without a stage being built. The opinion is that one is a willow and the other a poplar. How they obtained root in the masonry is a mystery.

Change in Eggs.—It is a common fact that eggs, though so well inclosed, begin to decrease in specific gravity as well as freshness, as soon as they meet the air. This is shown by the popular test of age in lye or brine. A fresh-laid egg will descend to the bottom of a solution that will float it higher every day thereafter, until it will soon appear above the surface. A coating impervious to the air prevents these changes.

A New Antiseptic.—An antiseptic whiting has recently been introduced, and is recommended by the makers for hospitals, ships, stables, kennels, etc., in order to keep them free from insects. The compound, which appears to contain some camphor, is also useful for cleaning silver plate and articles of domestic use. The aroma is said to be not unpleasant, while the compound is non-poisonous and will not injure colors.

Machine for Wall-Paper Printing.—Herr Hansenn, a Danish engineer, has patented for ten years a machine for the color printing of wall-paper, which prints all the colors desired at one impression. Hitherto every color has necessitated a separate journey through the press.

Paris talks of building three more Eiffel towers and then turning the four into the legs of a huge platform, whereon a sanitarium can be built for invalids.

Engineering Notes.

The Panama Canal.

The managers of the Panama canal seem just now to be making efforts to dispose of the few assets remaining after its collapse. These assets consist of some 34,000,000 francs in lottery bonds. About 20,000,000 of these bonds were absorbed in some debts of a peremptory character, leaving 14,000,000 to be otherwise disposed of. This latter amount is being rapidly swallowed up by a host of engineers and hangers-on who still cling to the concern, and will continue to do so as long as there is a five-franc piece left to gobble up.

Still it is generally conceded that the project will be revived again at some time in the future, under new auspices, and by more careful and considerate managers, who will carry it forward to completion.

In the absence of any new organization in France to revive the work, the Nicaraguan Government will eventually fall heir to the property as it stands, and under its patronage some organization will be effected to complete the work. How much that work will cost is a matter of great uncertainty until a new survey has been made. The guess of engineers is about $150,000,000. It may be more; it may be less; but nothing is more certain than that the two oceans will eventually be united.

At the rate the commerce of the Pacific is increasing, the time will soon come, and probably inside of twenty-five years, when the Nicaragua canal, which will soon be completed, will be utterly unable to meet the demands for transportation. Indeed it may be doubted if two canals will be sufficient, even when supplemented by additional overland railroads. The history of our present overland railroad furnishes abundant evidence of the truth of what we are writing. As has been intimated, and with much good reason, it may not be very many years hence when the Republic of Colombia may be able to sell the right of completing de Lesseps' unfinished work for a large portion of the money that the unlucky Frenchmen have already put into it.

The Nicaragua Canal.—Work upon this enterprise is being rapidly pushed. Parties are engaged upon both the eastern and western terminus. Two thousand men are already at work and the force will be gradually augmented as the enterprise progresses. The Nicaragua canal will, in one way and another, be productive of much good to the entire Pacific Coast. The company has just issued a book showing some of the advantages which will accrue from the completion of the work. The sailing distances saved between various ports on the Pacific and Atlantic are shown on a carefully elaborated chart, and present a saving of time, distance and expense most surprising to those who have not given the matter any special attention. It will especially work a most important revolution in the industries of the Central American States—a movement which is already apparent. It will greatly increase the coffee crop as well as all other industries, and call for the introduction of machinery, railroad supplies, etc., which will no doubt be largely ordered from our own shops, both on the Pacific and Atlantic.

The Ship Railway.—The collapse of the Panama canal has put new life into the Nicaragua canal scheme as well as the project for the Darien ship railway. The two former are more fully referred to in other paragraphs. The project originated by the late Mr. John B. Eads, to build a railway across the Isthmus of Darien for the transportation of ships from sea to sea, is now being revived with renewed interest. The Mexican Government has recently amended the concession granted to Capt. Eads by guaranteeing five per cent interest on $60,000,000, the estimated cost of the ship railway. That is, they have agreed to make up any deficit there may be in the earnings of the ship railway when completed, to the extent of five per cent. Captain E. L. Corthell says the work of construction will begin at an early day.

A Greater Work than the Eiffel Tower. The great cantilever bridge across the Frith-of-Forth is completed, except the girders to bridge over the 350 feet between the ends of the cantilevers. One of the bridge's cantilevers set up on one end would be nearly as tall as the Eiffel tower. The latter weighs 7500 tons, while the Forth bridge has taken over 50,000 tons of steel. The one is for show merely. The other is one of the most wonderful works of useful engineering ever constructed and will endure for centuries.

The Most Wonderful Railroad.—Colonel North's railway from Iquique to Pisanqua, in the Chili niter district, is one of the most wonderful in the world. It zigzags up and down the Cordilleras in the solid rock for 48 miles. The engines drawing cars on the road are double-enders, exactly alike at both ends, with two smoke-stacks and one cab.

The three-feet gauge "system" has made great progress in disappearing this year, at least seven roads of this width having gone over to the majority and adopted the standard gauge.

The railway bridge over the river Dee, near Chester, England, will be shortly opened for traffic. It has taken 25 years to construct.

Passing Events.

It seems that the Bear's Nest mine, Alaska, for which a 120-stamp mill has been built, does not come up to expectations. Reports from there are to the effect that over 1200 feet of tunneling fail to reveal any ore of value, and all labor has stopped.

Secretary Davies of the State Board of Trade is issuing circulars to the miners and mine-owners of the coast, asking for specimens of their mineral products, to be exhibited in the new California on Wheels. One department of one of the cars will be devoted to the mineral display, which will make California on Wheels complete, our wine, fruit, cereal and manufacturing industries being already represented.

The test case involving the title to the Eagle Bird mine will settle the question of the right of the railroad to the minerals. The miners claim that mineral land was excepted from the railroad grants.

Some English capitalists are buying copper properties in Mexico. A new company has put in $450,000 as working capital for the Chiapas mine.

The cruiser Charleston, which made several preliminary and successful trials in the bay during the past week, is now off on her official trial. The defects in her machinery have been remedied.

THE Oregon Coal Company intend to reproduce on a reduced scale at the Mechanics' Fair the Eiffel tower in coal.

Roll and Jig vs. Battery and Vanner.

The Commonwealth mine of Tuscarora, Nev., has been losing 20 per cent of the value of its ores since the mill was started, and the directors very wisely concluded that the continuance of milling with such results is so detrimental to the interests of the stockholders that the extracting and milling of ore should be suspended until such time as may be required to overcome existing defects. The grade of ore worked has been about $125 per ton, but a higher grade of ore would work to a better percentage, owing to its containing less calcspar or lime and a higher per cent of sulphurets. To obtain that grade at present would necessitate the extraction of only the highest grade, leaving large masses of ores, assaying from $15 to $75 per ton, to be mined hereafter, which, from the nature of the ground, would add materially to the expense over and above what it would cost were it all extracted at the same time. In order to obtain immediate returns from the whole output, and grade the ores for the most profitable results, the company has been constantly experimenting to find the cheapest and best means of doing so. While rolls for crushing and the jig principle of concentrating was found to be successful on ores containing coarse sulphurets, it was not found applicable to the characteristics of the ores of the Commonwealth.

The directors have made up their minds that they have in the plant now being erected by the Grand Prize Co. (batteries and Frue vanners) discovered the system of concentration best adapted to Commonwealth ores. The product from the Frue vanners, which will be high-grade ore, will contain the required per cent of sulphurets to mix with the milling ores to insure their successful treatment to a high per cent of their value.

Under the circumstances the company has decided to stop taking out ore until the best methods available can be put in operation to treat the ores.

Mining Premiums.

The directors of the El Dorado District Fair offer for the best and second best general display of fruit, premiums of $150 and $75; for the best and second best display of vegetables, $100 and $75; for the best and second best display of minerals produced in El Dorado county, $30 and $25. This county is that in which gold was first discovered in California; and the amounts offered for the respective articles show the change which has come over some of the mountain counties.

Even the State Fair now pays little attention to mining products. Yet there were days when it was thought proper to offer prizes for many things connected with the mining industry. We have before us an old scrap-book in which is an extract from the Marysville *Express* of Nov. 27, 1858, which contains the following list of mining premiums awarded by the State Agricultural Society for 1858:

QUARTZ MILLS.

1st Premium—Gold Hill Mill, Nevada county.
2d Premium—Gold Bluff Mill, Sierra county.

SHAFT MINING.

1st Premium—Alta Shaft Co., Nevada county.

HYDRAULIC MINING.

1st Premium—Dead Man's Claim, North San Juan, Nevada county.
2d Premium—Wyoming Claim, Nevada county.

RIVER FLUME.

1st Premium—Union Cape, Butte county.
2d Premium—Channel Rock, Butte county.

This shows that Grass Valley carried off the first premium for both shaft (drift), and quartz mining. The Gold Hill mill was at that time in charge of Melville Attwood, Esq., now of this city, who also received a silver medal for the best amalgamator exhibited at the fair.

It would seem perfectly proper to have continued these premiums for mining and milling. At that time a special committee personally visited the competing mills and mines, and on their report was based the awards. It would be a good thing in these days to have some public competition in the matter of milling of gold ores and construction and arrangement of gold mills. This would arouse a spirit of rivalry of great benefit to the mining industry. People now about to build do not know where to look for the best example of a mill, but official recognition of any one would soon make it conspicuous.

Hydraulic Engine for Mining Purposes.

Mr. H. D. Pearsall of London has devised a hydraulic engine for supplying water at pressure for hydraulic mines. The advisability of pumping water instead of supplying it by gravity has often been suggested, when sufficient water-power for the purpose of pumping happens to be available. But the expense and complication of machinery has heretofore prevented. Mr. Pearsall was called upon to make plans and estimates for an extensive placer mine in Colorado, and devised pumping arrangements to cost less than half what a ditch on the usual plan would cost. The hydraulic engine is shown in the cut. It is one which is in use in England, and is similar to that designed for the placer mine.

The engine or machine acts on the principle of the hydraulic ram to this extent: That both the new machine and the hydraulic ram "obtain their pumping-power by the arrest of a column of water which has been previously set in motion by gravity."

The new machine differs so much in construction from a hydraulic ram that the objections to which the latter is open are not applicable to the new engine.

The feature of hydraulic rams which has restricted them to a small size is their violence. In the new machine this is not only reduced, but has no existence at all. It works with all the smoothness of a well-constructed reciprocating engine.

By using what may be called the fundamental principle of the hydraulic ram, we are able to do what we cannot do in any other way—pump water by the agency of water-power directly by one machine, instead of using turbines to obtain power, which turbines have then to drive pumps. Moreover, this one machine is a far simpler one than the pumps alone which would otherwise be required, and as it works very slowly it requires much less repairs.

The construction of the engine is shown in the engraving on page 141, as follows: *A* is a pipe (called a flow pipe) which conducts water from the source of supply to the engine. *C* is the main valve (here shown open). The water flowing down the flow pipe freely escapes through valve *C*, when it is open, as shown in the figure. *D* is a rod attached to valve *C*, by which valve *C* is moved up and down at proper intervals of time by means of the motor *E*, further described below. *F* is a chamber or receiver immediately above valve *C*. At the period of the stroke of the engine, which is represented in the figure, this chamber contains only air, and communicates freely with the atmosphere by the pipe *G*. At the base of pipe *G* there is a valve *J* which carries a float.

When the main valve *C* is raised and closed it of course shuts off the flow of water; but it does not interfere with the flow of water until it is *completely* closed, because, until the chamber *F* is filled with water up to the float *H* the valve *J* remains open, giving free communication between chamber *F* and the atmosphere, consequently the air freely escapes from the chamber and the water freely rises in the chamber. This action takes place *during the closing* of the main valve *C*. The consequence is that no power is wasted in forcing water through the narrowing orifice. A second consequence is that there is no necessity to close this valve with great rapidity (which is necessary in hydraulic rams). As a matter of fact it is closed by a gradually retarded motion and so comes to rest without any concussion. When the water touches the float *H* it closes the valve *J*, shutting off the passage for escape of air, and the pressure in the chamber then rises to the point at which the valves *K* open, and some of the water flows into the air vessel *L*, from which it of course is constantly flowing out through delivery pipe *M*. A little air still remains in the chamber. This air is compressed and enters the air vessel, and is used to drive the motor which actuates the main valve.

The column of water flowing in the flow pipe is thus brought to rest entirely by the elastic resistance of air. When it has ceased to flow the main valve is again opened, the water with which the chamber *F* is now full escapes, the air valve *J* falls open, admitting atmospheric air, and the water again begins to flow and to escape through valve *C*.

The engine which it is intended to construct for the placer mine is similar in every respect to this one but of larger size, and is expected will supply 1000 miners' inches, or 10,000 gallons per minute.

The works to be constructed for the placer mine consist of a short ditch, about two miles long, which will be entirely made by plowing, and in alluvial soil. In this distance a fall of 80 feet is obtained, and here hydraulic engines of the above description will be erected about half a mile up the gulch, the stream from the short ditch flowing through the pipe to the machine, and a proportionate part of the water being raised directly to the hight desired.

Besides economy the system has the following incidental advantages: The water may be used with a high pressure even at the highest points of the placer, which is often difficult to arrange when using only gravity. The pressure available for hydraulicking is not limited by the topographical features of the country, as is often the case in the ordinary system. At the point where the machines are erected, a large extra supply of water is available besides that at high pressure, and will greatly help to keep the tail-flume clear.

Lixiviation.

Mr. C. A. Stetefeldt, M. E., formerly of this city, but for some years past a resident of New York, has returned to San Francisco, where he will remain for the present. Mr. Stetefeldt is the inventor of the furnace which bears his name and is the author of "The Lixiviation of Silver Ores with Hyposulphite Solutions." In speaking of the leaching process at the Marsac mill, Park City, Utah, Mr. Stetefeldt says that they still amalgamate a small part of the ore because they have not enough vats to leach all the ore. Additional vats have been ordered, however, and will soon be in place, when pan-work will be stopped altogether.

Mr. Russell, the inventor of the Russell process, is at present at Sombrerete, where he has successfully introduced his method of treating ores. The results are satisfactory to Mr. Clarence King, who is now there.

It is understood that the Blue Bird mine, Butte, M. T., will soon use the lixiviation process. When in Chicago recently, Mr. Stetefeldt was shown by Fraser & Chalmers specifications for a leaching plant for this mine, on which bids were asked.

Mr. Stetefeldt will shortly make a trip to Park City, where he will make certain tests on some Mexican ores.

In addition to what we are told by Mr. Stetefeldt, it is learned from Modest Maryanski, in charge of the Arlington mine, Ruby district, Whatcom county, W. T., that the process will be adopted there. The ores have been thoroughly tested by different processes. The results from a carload shipped to Park City, Utah, were the most successful, averaging over 97 per cent of the assay value of the ore, and it was finally decided that the Russell lixiviation process in use there should be adopted. Messrs. Maryanski and Geo. W. Woodward are now in this city, and it is understood they have already contracted for a 50-ton plant, at a cost of over $80,000. This calls for the completion of the machinery by the 1st of December next, and the company hopes to be running full blast at the opening of the new year.

AT the last meeting of the Geographical Society of the Pacific, the secretary, C. Mitchell Grant, read an essay on the life and work of Henry M. Stanley, the African explorer. Prof. Davidson read two papers, one on the "Currents in and About the Golden Gate," and the other on the "Eddy and Inshore Currents off the Coast." The papers were illustrated by a chart of the coast from this port, following the coast line to Kodiak, Alaska, and described the researches made and information gathered by the professor in connection with coast currents during a period of over 20 years.

LOWER CALIFORNIA DUTIES.—The cashier of the Tia Juana Custom-house says his office has received orders from the Mexican Government instructing the Collector of Customs to require the payment of full duty on all goods, wagons, buggies, etc., from all persons crossing the line whose destination is beyond 15 miles of the neutral territory. This virtually puts a stop to the mining operations of Americans in Lower California, as few will consent to pay the heavy duties. Two wagon-trains were turned back from the line recently.

Bimetallism.

The State Department is in receipt of a report by Consul Frank H. Mason of Marseilles, in which he says:

One of the clearly defined tendencies of public opinion in Europe, notably in France, Germany and England, is seen in the steadily growing sentiment in favor of restoring a bimetallic standard of currency. In the strong and numerous petitions read before the German Reichstag, in recent resolutions of Chaplin in the British House of Commons, as well as the frank declaration of Lord Salisbury in favor of earnest participation in Great Britain in the forthcoming conference at Paris in next month, and in the outspoken attitude of such serious and influential French journals as *Le Moniteur, Des Interets Materiels* and *Moniteur des Syndicats Agricoles* may be recognized the outward manifestations of this new faith and purpose.

The above shows that our representatives abroad are beginning to awaken to a realization of the fact that there are other interests besides that of commerce which are deserving of careful watching, particularly that of finance and its bearing toward bimetallism. Their official position must undoubtedly give them superior facilities for securing valuable information on the subject—such information as would throw much light on the injurious effects of monometallism. Their efforts would officially confirm very many of the statements based on commercial and financial statistics put out by friends of bimetallism, and do no little toward converting the many to its support.

There is no doubt that the extraordinary effort of the European Governments to hoard gold against a general war in the Eastern Hemisphere, has convinced many leading financiers, as well as many astute statesmen, that the time is not only ripe for bimetallism, but it is a growing necessity. This necessity is recognized in the official statements of leading continental banks as published in a tabulated form in a late issue of the New York *Financial and Mining Record*. The statement in question gives the footings as follows:

	Gold.	Silver.
Bank of France	$203,270 000	$248,260,000
Imperial Bank of Germany	157,350,000	78,675,000
Austro Hungarian Bank	27,250,000	78,250,000
Netherland Bank	25,620,000	33 335,000
National Bank of Belgium	13,940,000	6,970,000
Bank of Spain estimate	50,000 000	12,335,000
Totals	$477,380,000	$457,925 000

	Circulation Notes
Bank of France	$576,825,000
Imperial Bank of Germany	249,151,000
Austro-Hungarian Bank	197,695,000
Netherland Bank	90,575,000
National Bank of Belgium	71,725,000
Bank of Spain estimate	145,236,000
Total	$1,130,105,000

The leading or national bank of Russia is not given, which, if obtainable, would impress the student of political economy still more forcibly that bimetallism is a growing necessity. The above shows that the circulating notes of the six leading continental banks are in excess of the gold held, $652,725,000, and of both gold and silver $194,800,000. So that if a run was made on the banks, or, as for that, any one of them, there would not be coin on hand to meet the demand. This is one way in which to view it, but there is another of equal moment, viz., the relation of coin to commerce.

A patient but deservedly recognized authority on financial subjects presented tabulated statistics, which went to prove that the world's commerce had increased from the year 1830 to 1880 from $1,840,000,000 to $13,250,000,000, and that during the same time the value of the world's coin had only increased from $1,565,000,000 to $5,640,000,000. The value of trade has increased, by this calculation, more than twice as rapidly as the value of money. Facilities for the transfer of bulk have been multiplied many fold since 1830, but the medium of exchange has not increased four fold. The rate of coin to commerce in 1830 was 85 per cent, and in 1880 42 per cent.

As gold is the standard money and the cash reserve for all forms of credit in the two hemispheres, and its ratio to the volume of commerce is only half as large as formerly, it follows a mathematical induction that its carrying power has doubled. It is in effect carrying more than twice the value to the units, which means that its exchange value is doubled, or, in plainer terms, that it is worth twice as much. This at first would have been the exact mathematical product of the changed conditions had not the system of shifting cash to credit been immensely expanded—the substitution, in fact, of margin dealings under various devices.

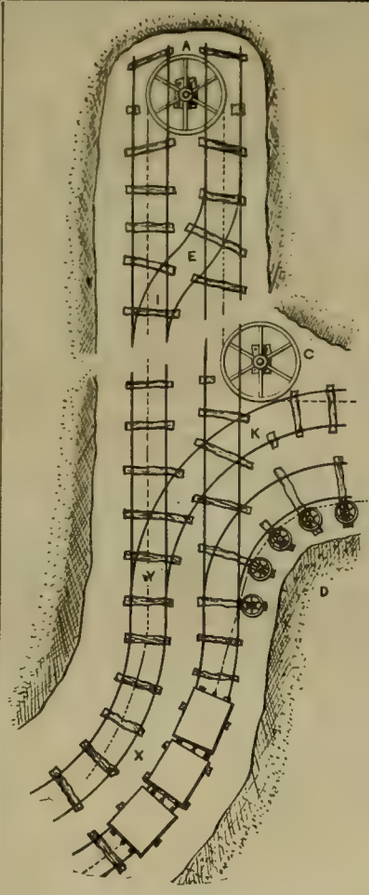

Fig. 2.—THE ENDLESS ROPE SYSTEM APPLIED UNDERGROUND.

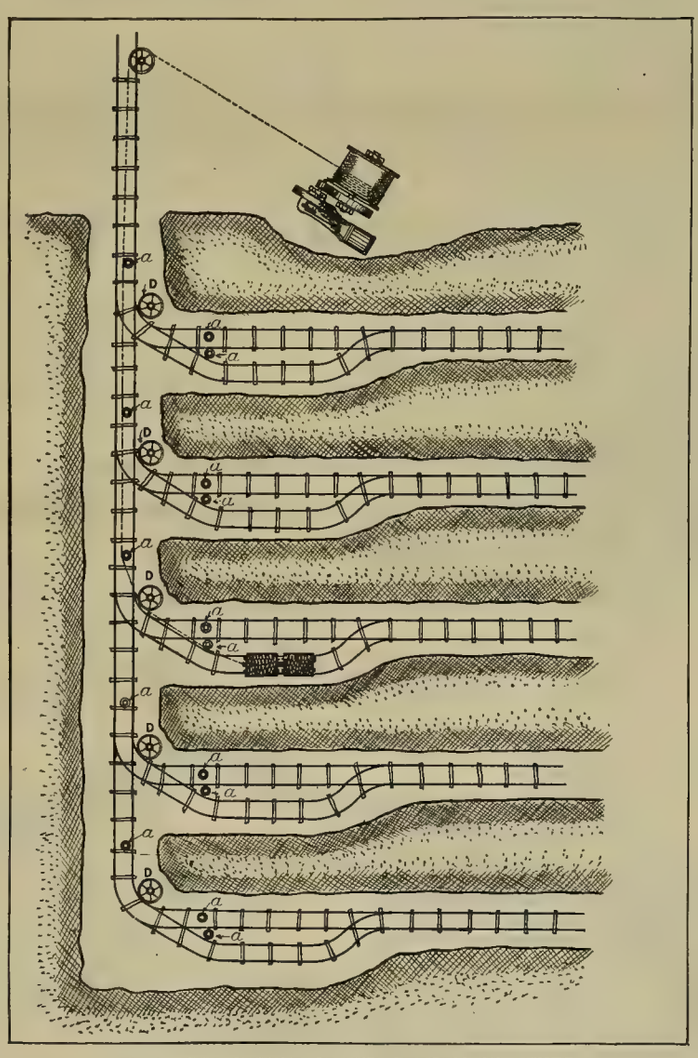

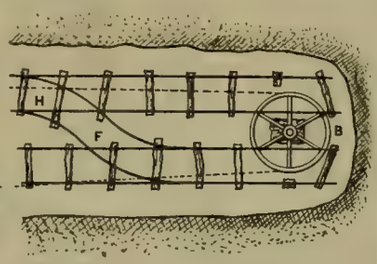

Fig 1.—THE SINGLE PLANE SYSTEM IN MINES.

The gold reserve of the banks of England and of the British Isles is about 4.7 per cent, while in the United States the bank deposits aggregate over $3,000,000,000, and specie held by them of only about $200,000,000. Every debt is a gold debt except in the United States, where we have greenbacks, silver and gold certificates, and silver coin which may, in an emergency, stand off any demand for gold. The first three are themselves redeemable by the United States Treasury on demand.

Wire Rope Haulage in Mines.

We have formerly quoted from Mr. F. C. Roberts' paper on "Wire Rope Haulage and its Application to Mining," and now reproduce cuts showing arrangements of underground

tracks. Fig. 1 a single engine plane. In this it is usual to employ a non-reversing engine, and, as in the case of the single hoist, the slope may be operated by employing the power of the engine but half the time. In such instances the empty cars are allowed to descend by gravity, the drum running freely on the shaft for the time and being controlled by a strap-brake or friction-clutch. It is sometimes convenient to locate the engine at the foot of the plane, the hoisting rope being supported along the side of the slope by rollers and led to the head of the plane, where it passes around a wheel of large diameter and, returning down the track, is attached to the car.

The single-slope system is peculiarly applicable where there are a number of side-entries located at different levels below the surface. In this case the train of descending cars may be stopped at the entry into which it is desired to switch some of the trucks, the train in th meantime being prevented from premature starting by a lock consisting of a timber pivoted and thrown over the rails. When the disconnection has been made, the signal is given and the train descends to a lower level, where the operation may be repeated. In hoisting to the surface, the cars in the various side-entries are run to the main entry, and, in a manner similar to that above described, switched to the main slope and connected to the rope.

An improved modification of the single plane is illustrated in Fig. 1. Here, for the accommodation of the empty or loaded cars, each side entry has its individual parting or siding placed near the main entry, and in this way the plane is practically divided into as many separate planes as there are entries. Loaded cars are taken from each entry in succession, and the empties returned in the same order, the position of the end of the rope being indicated to the engineer by marks upon the rope, or better, by an indicator attached to the drum. Proper switches, etc., are located at the desired points, and the rope is guided into the entry by drums, *D*, placed in the angles as shown. These drums have a face of two and a diameter of five feet. Guide rollers, *a*, are placed at suitable points.

Fig. 2 shows a form of the endless-rope system. Endless-rope haulage is divided into two systems: 1. That in which the motion of the rope is continuous in one direction; and 2, that in which the rope is driven alternately in opposite directions. The first is the double track and the second the single. The latter is practically the tail-rope system, used in connection with an endless wire rope. The chief advantage of the endless system is that it permits stopping or starting the train at will without interrupting the motion of the engine, and in this manner does away with the system of signals necessary to a tail-rope plant. A familiar application of this system is that of cable railways for passenger traffic, which, in fact, is a complete and extensive endless-rope haulage system.

The operation of the side entries and branches in the single-track system is similar to one of the tail-rope methods, except that in this case the rope is continuous. A grip is used to connect with the rope. The jaws are about 1½ inches above the level of the rope when resting on the supporting rollers. In order to enable the grip to clasp the rope when starting a train, counterweighted supporting rollers are placed at convenient points. These pulleys raise the rope at the desired points to the level of the grip, and their vertical motion permits the passage of the grip without difficulty. Referring to Fig. 2 it will be seen necessary to introduce these pulleys at points *H* and *Y*. In many mines it has been found more convenient to adopt such arrangements that the rope is stopped for attaching and detaching.

Latest Copper Situation.

With the decline in the price of copper comes a corresponding increase in the consumption. For a verification of this we need not go outside of the United States. According to the latest official statements of the output of fine copper by the leading mines in this country, that for the first half of 1889 compares as follows with the first half of 1888:

LAKE SUPERIOR MINES.	Pounds.
1889, 12 mines	42,000,000
1888, 9 mines	38,000,000
Increase	4,000,000

MONTANA MINES.	Pounds.
1889	13,400,000
1888	7,400,000
Increase	6,000,000

From these two sources alone the output the first six months of this year over the like time in 1888 was 10,000,000 pounds. The tabulated statement of the output showed that in the month of June this year there was a falling off of the Lake Superior mines, compared with the output for the month of May, of 600,000 pounds. The natural inference from this is that the output is being decreased. While the output shows an increase, the exports show a falling off, for the official returns of the exports of ingot copper from this country for the fiscal year ending June 30, 1889, were only 14.324,043 pounds, against 25,303,337 pounds for the preceding fiscal year.

Turning to Europe, we find that the stock of copper is being steadily lessened under a free consumption. The latest information

gives the stock of fine copper the world over at 107,975 tons on the first day of the present month. Although this is unquestionably a heavy incubus for the trade to carry, yet large as it is, it shows a falling off of 16,895 tons since last March, in which month stocks reached the highest point on record. With a reduction in the stock of 16,895 tons in four months' time, it would take at that rate just about 15 months (presuming the output would not be increased or prices inflated to retard consumption) to reduce it to the lowest point ever reached—December, 1877, when it was only 42,300 tons.

Mexican Lead Ores.

In different parts of Colorado the miners have been holding meetings and passing resolutions asking the President and Secretary of the Treasury for relief in the unwarranted advantage given importers of ore containing lead into this country from Mexico. At a recent meeting at Leadville, the following resolutions were adopted, which are of the same general tenor as those passed elsewhere in the State:

WHEREAS, The first civilized settlements of the territory now embraced within the limits of the State of Colorado were made by the pioneers who visited it in search for minerals carrying precious marketable metals; and

Whereas, Since the advent of the first miner, the territory has yielded over $250,000,000 in gold, silver, lead and copper; and,

Whereas, Solely in consequence of Colorado's mineral wealth, it is now a prosperous State, with a population of 400,000 people; and,

Whereas, The major part of the valuable metal product was derived from lead ores, which carry varying amounts of silver with lead always a prominent and often a preponderating factor of value; and

Whereas, Remoteness from the center of population makes it impracticable for the State of Colorado to compete as an agricultural, manufacturing or stock-growing region with States which have the advantage of easy access to the great markets of the country; therefore, be it

Resolved, That the past growth and present condition of this State is due to and its future prosperity depends mainly upon the production of argentiferous lead ores, which directly furnish employment to a large proportion of the mining population and indirectly constitutes the support of the entire people.

Resolved, That the encouragement and conservation of the mining interest is a matter of vital importance, not only to those engaged in mining as a business, but also to every professional and business man, every farmer, mechanic or laborer.

Resolved, That the price received for lead contained in ore product in the mining districts is of so great importance that pursuing any course which tends to lower it to the standard of the cost of production in a neighboring country where low wages prevail, is a matter of grave concern to every business interest and wage-earner in the State.

Prevailing Construction.

Resolved, That the prevailing construction of the clause of the statutes of the United States, which empowers a duty upon the importation of foreign lead ores, amounts practically to their admission duty free, as is evidenced by the large daily increasing importation of such ores from the Republic of Mexico, upon which no duty is paid, the traffic in which has increased from 7000 tons in 1884 to 84,000 tons in 1888.

Resolved, That the constructions which involve the classification and collection of import duties, by preponderating the weight contained in metal bullion and preponderating the value of metal contained in ores when the duty on each is imposed by some statute in practically the same words, are themselves contradictions and stultifications which call for a revisal or reconcilement, so that in any event the basis for revenue collection may be identical.

Market Fluctuations.

Resolved, That the determination as to the dutiable and non-dutiable character of an imported ore by classing it as an ore of that metal of which it contains the greater value is varying, uncertain and impracticable, in that where values are approximately even it may be a "lead ore" one day and a "silver ore" the next, owing to a slight rise or fall in the market value of either metal, and further, in that such construction presents an open door to fraud, as dutiable "lead ore" may be transformed into non-dutiable "silver ore" by the addition of a small quantity of mineral grading high in silver.

Resolved, That in making inquiries as to the bearing which this construction of the statute has upon the interests involved, the authorities should have sent their agents to the lead-producing districts of the United States as well as to a few border towns and other places in which are located reduction works deriving their lead-ore supply from abroad.

How Miners Classify.

Resolved, That as miners and inhabitants of the mining region, we have never considered it necessary to consult an assayer before classifying galena or other ore which from its weight and appearance to the eye evidently contained a large percentage of lead. The invariable rule is to call all such "lead ores," although the value in silver and gold, be they great or less, can only be determined by careful tests and the exact lead contents by a similar test.

Resolved, That we demand that protection for our chief industry which the existing tariff Act was intended to provide, and we call upon the treasury department of the Government to reconsider and reverse the nullifying construction heretofore made.

Resolved, That the chairman of this meeting is instructed to forward a copy of these resolutions to the President of the United States and to the Secretary of the Treasury.

On the 12th inst. the Southwestern Mining Association met at El Paso to take action on the Mexican lead-ore question. The association represents the mining interests of Texas, Arizona and New Mexico, besides the American miners in Mexico. They want the importation of lead ores from Mexico continued on account of the smelting (not mining) interests. The resolutions adopted by the association are as follows:

WHEREAS, At the instance of the lead monopolists of Colorado, a meeting of citizens was recently held in Denver, the object of which was to protest against the free importation of lead ores from Mexico and other countries, and resolutions to that end were adopted; and whereas it is the manifest aim of these monopolists to encourage the use of public opinion demanding the repeal of the law now in force on such importations and a reversal of the rulings heretofore made by different Secretaries of the Treasury by which the introduction of such ores from Mexico has been made an exchange of commodities with that country; and

Whereas, Such resolutions seek to break down and destroy the smelting interests of the Southwest by denying the importation of fluxing ores essential to the smelting of dry and refractory ores, which are the products of Texas, New Mexico and Arizona; and

Whereas, Further growth and prosperity of the Southwest is already well advanced and will continue to be mainly dependent on the commercial relations now subsisting between Mexico and the United States; and

Whereas, To insure continuance of this prosperity and to encourage the growth of that section, every channel of trade for the importation of Mexican ores to be employed in payment for the exportation of American products and manufactures, should be kept open and constantly widened by legislation; and

Whereas, That section, with its many new and well-equipped smelting plants and Mexican silver-lead ores introduced free of duties, combined ample conditions and facilities for the profitable reduction of its own ores, thereby saving from waste a large per cent on account of the treatment of dry and refractory ores and the freight thereon to the smelters of Colorado; therefore it is

Resolved, By the El Paso and Southwestern Mining Association: First—That in behalf of the mining interests of Texas, New Mexico and Arizona we condemn the methods and aims of the Colorado men, and as well the spirit and purpose of the resolution referred to, and claim from the Government of the United States protection and equal rights. Second—That copies hereof be forwarded to the Secretaries of the State and Treasury Departments and each member of Congress from the State of Texas, and the delegates from Arizona and New Mexico.

SAN DIEGO county now rejoices in a soap mine.

REBELLIOUS MINE WANTED.

Rebellious Quartz Mine; must be rich, in California, and accessible. Address, with particulars,
REFRACTORY, Box 2517, San Francisco, Cal.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron bangers for top saw. Friction feed-works, patent steel screw double-throw headblocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,
San Francisco, Cal.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leller, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft.; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents,

One being for coarse and one for fine sulphurets. These Concentrators are both patented. For further particulars address

J. A. JONES, Tuscarora, Nevada.

—THE—
PERFECTED
DOUBLE
Economic
Quartz
Mill.

Attached to each Mill is an effective
Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

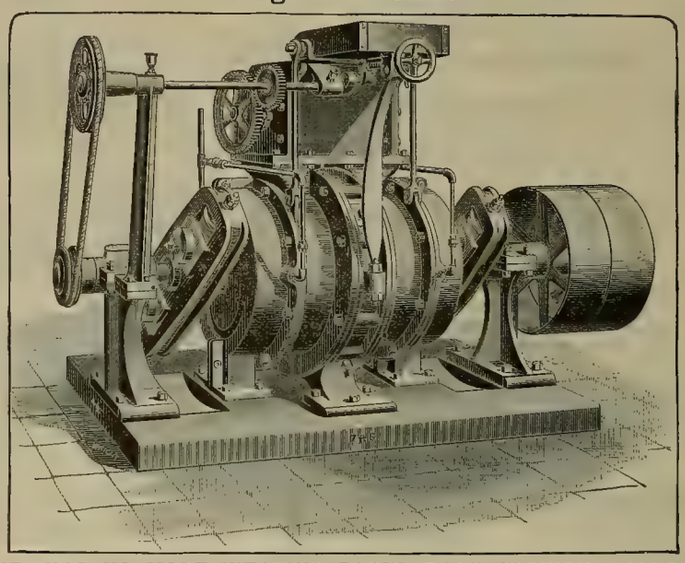
ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?

Are you going to make any change in machinery? Are you freighting by team or packing on mules? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of THE DODGE PATENT INDEPENDENCE

WOOD SEPARABLE or SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and most Convenient Pulleys made in the world.

Adapted to any power required. Time, trouble and money saved by using these Pulleys.



☞ Price List and Catalogues mailed free.

Also SIMONDS' SAWS furnished to order as follows: Inserted Point (Mill and Edger), Inserted Tooth, (California Pattern,) Solid, Shingle and BAND SAWS, all sizes, Crescent Ground Cross-Cut, etc. Also Planer Knives.

SIMONDS SAW CO., 513 Mission St., San Francisco.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING AUGUST 13, 1889.

409,091.—ORE CONCENTRATOR BELT—John M. Adams, S. F.

409,092.—ORE CONCENTRATOR BELT—John M. Adams, S. F.

409,095.—ADJUSTABLE GEAR FOR CRUSHING ROLLS—Hans C. Behr, S. F.

408,942.—FINGER GUARD—E. H. Chesterton, Los Angeles, Cal.

409,029.—TOBACCO AND MATCH CASE—F. E. Elliott, Miles, W. T.

409,104.—CONDUIT ELECTRIC R. R.—Byron Jennings, San Jose, Cal.

408,929.—SOLAR WATER-LIFTING APPARATUS—A. L. Reynolds, Elsinore, Cal.

408,930.—HARROW—S. Rothchild, Pendleton, Or.

409,058.—DRIVING OR STOP MECHANISM—Oscar W. Schmidt, S. F.

409,072.—AMMONIA CONDENSER FOR ICE MACHINES—Paul Steck, Oakland, Cal.

408,944.—SAFETY STIRRUP—J. C. Welcome, Burns, Or.

409,084.—ORE CRUSHER—G. W. Weller, Baker City, Or.

The following brief list by telegraph, for Aug. 21st will appear more complete on receipt of mail advices.

California—Kasson A. Brigham, Gilroy, two-wheeled vehicle; John E. Foster, Ferndale, horse-blanket; Adam W. Gilfillan, Mendocino, high and low water alarm for steam boilers; Frederick E. Gladwin, San Francisco, type-writing machine; Christian F. Jacobson, San Francisco, dry ore concentrator; Jacob G. Kenyon, Port Kenyon, vehicle axle; John H. Liso, Los Angeles, assignor of one half to W. S. Maxwell, combined wrench and oil can; Harry H. Lore, [Sacramento, posting or copying guide for bookkeepers; William Patterson and E. Groat, San Francisco, assignors to California Bituminous Block Manufacturing Company, bituminous sand rock for building, roofing and repairing purposes; Jacob Price, San Leandro, bailing-press; Alexander Watson, San Francisco, brake for railways; Edwin J. Weston, San Francisco, machine for cutting off piles; John J. Williams, San Francisco, smelting furnace.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HARVESTING MACHINE.—James H. Adamson, North Melbourne, Victoria. No. 408,398. Dated Aug. 6, 1889. The invention relates to certain improvements in harvesting machines of that class in which a comb having long pointed teeth is employed to strip the heads from the standing grain without the use of a reciprocating sickle, and it consists in making the combs adjustable, so that the teeth may be opened or closed to suit heavy or light crops.

VEIL-FASTENER.—Philo N. Tyron, S. F. No. 408,445. Dated Aug. 6, 1889. This fastener consists of two rings, one of which is slotted so that the other will pass into the slot, the two being thus locked together. One end of the scarf or veil to be fastened can be drawn into each of the rings, being held by the fingers. The veil is brought across the face, the ends being brought together behind the head and the two rings are brought together and latched, and they compress the ends of the veil or scarf, and thus hold it firmly and prevent its slipping out. The rings are easily detached from each other by slightly pressing them, so as to release the catches.

CONDUIT ELECTRIC RAILWAY.—Byron Jennings, San Jose. No. 409,104. Dated Aug. 13, 1889. This improvement in electric railways consists in a means for insuring a continuous electrical connection while allowing for the expansion and contraction of the electrical rails upon which the trolley or conducting wheel travels, and in a means for securing and adjusting the brackets upon which said rails are supported. The invention is an improvement in that class of electrical railway in which an underground conduit is employed with an electrical rail upon which a trolley or wheel travels to keep up a continuous electrical connection between the rails and the motor; and the improvement is designed to keep the electrical rail in perfect condition as a conductor, and to secure and adjust the brackets by which it is supported so as to keep it approximately parallel with the line of travel of the car and motor.

ORE-CRUSHER.—Giles W. Weller, Baker City, Oregon. No. 409,084. Dated Aug. 13, 1889. This invention relates to that class of ore-crushers in which the material is fed and crushed between opposing movable jaws. In this the crushing jaws are pivoted on horizontal shafts in the ends of the frame, adapting them to be moved up and down through an arc in a vertical plane about the shafts as centers. The working faces of the jaws are curved oppositely with respect to each other and are provided with shoes. Two transverse shafts in the upper part of the frame are connected to gears from which depend links, the lower ends of which are connected with the crushing jaws. The jaws are raised and lowered simultaneously by the crank-shafts and links. As they rise, the space between the upper portions of their shoes widens and the space between the lower portions contracts. As they fall, the space between their upper portions contracts and the space between their lower portions widens. The ore passes down into the opened portion between the upper portions of the jaws as they rise and is crushed between them as they fall, being readily discharged from between their separating lower portions.

AMMONIA CONDENSER FOR ICE MACHINES.—Paul Steck, Oakland, assignor to Parke & Lacy Co. No. 409,072. Dated Aug. 13, 1889. The invention relates to the class of ice machines, and especially to the condensers, through which the ammonia is passed and in which it is condensed by the water which trickles over the exterior of the pipes. It consists in a novel condenser composed of separated sections or coils of pipes, the lowermost pipe of each section or coil being connected with the uppermost pipe of the section or coil adjacent, an inlet for the ammonia gas to the top of the first section or coil, and an outlet for the liquid ammonia from the bottom pipe of each section or coil.

ADJUSTABLE GEAR FOR CRUSHING ROLLS.—Hans C. Behr, S. F., assignor of one-half to Benjamin T. Lacy. No. 409,095. Dated Aug. 13, 1889. The invention consists in the novel mechanism for varying the position of the gear on its shaft by adjusting it rotatively and holding it in the position to which it is adjusted. The object is to provide for so moving or changing the position of the gear as to effect the accurate adjustment of the parts to be driven. In ore-crushing mills, in order to secure the most uniform size of crushing material, the rolls should in all positions of revolution present the same width of opening between the two corrugated crushing surfaces. Where this is not the case the rolls are not in proper adjustment, and as a consequence the space varies and the product varies very much in the size of the particles. In order to overcome this difficulty, it has often been found necessary to refit gears on the roll shafts in different positions by cutting other key-ways or enlarging existing ones and introducing wider keys; but by Mr. Behr's invention either one of the gears may be readily and accurately adjusted upon the roll shaft and held in that position, so that the space between the rolls shall be uniform and the resulting product as desired.

CONCENTRATOR BELT.—John M. Adams, S. F. No. 409,091. Dated Aug. 13, 1889. This is an improvement in that class of endless belts such as are used on the Frue concentrator. The invention consists in a novel improvement in that form of ore-concentrating belts which are provided with overflow apertures, the mouths or edges of which are elevated above the pulp-holding surface. The object is to better direct the overflow from the pulp-holding surface by discharging it at the lower end of the machine and not allowing it to fall down directly under the belt, which results in injury to and undue wear on the rollers on which the belt rests and travels, and other portions of the machine, and also results in wear on the belt itself, on its under surface, caused by the sand working between said belt and rollers.

ORE CONCENTRATOR BELT.—John M. Adams, S. F. No. 409,092. Dated Aug. 13, 1889. The object of this invention is to increase the concentrating capacity of such belts as are used in endless belt concentrators. The surface of the belt, instead of being smooth, as is usually the case, is made undulating, this result being obtained by forming or fashioning the surface with gentle continuous concaves and intervening continuous ridges, both extending in the direction of the flow. The object of this construction is to allow the sulphurets and heavier portions of the material under treatment to fall rapidly and positively to the lowest portions of the depressions or concaves, thereby effecting a more complete and rapid concentration.

DRIVING OR STOP MECHANISM.—Oscar W. Schmidt, S. F., assignor of one-half to I. S. Cohn. No. 409,068. Dated Aug. 13, 1889. This invention relates to that class of mechanisms adapted for throwing machinery into and out of connection with the power device, or stopping the machinery positively when disconnected. The invention consists in certain constructions and combinations of devices.

THE SUNFLOWER.—Late advices from Pike City, Sierra county, state that the Sunflower Gold Mining & Milling Co. are making active preparations for the erection of a mill and all necessary buildings for the reduction of ore. Two five-foot Huntington mills have been ordered and arrangements made for a third if it is needed. The entire lot of machinery, engine, boiler, ore-crushers, etc., will be shipped this week, and everything will soon be under cover before the rains set in.

THE Plumas *National* tells of a curious deed that is on record in that county. The grantor conveys to the grantee "all the mines and minerals contained within 3000 acres of land, reserving all the timber growing upon said lands, except such as it may become necessary to remove to extract the minerals." It is thought no such instrument appears on record in any other county of the State.

Mining Personals.

C. M. Clark is superintendent of the Dixie mine, Arizona.

Geo. D. Roberts, the mining speculator, has gone to Montana.

R. P. Keating, superintendent of the Savage mine, is in the city.

J. H. Marriott is superintendent of a hydraulic mine at Osceola, Nev.

Prof. Thos. Price has returned to San Francisco from a trip to Montana.

E. D. Boyle has been re-elected superintendent of the Alta, on the Comstock.

Geo. W. Grayson has returned to his home in Oakland from a visit to Tuscarora.

John F. Boyle is manager of the Lone Star mine, Humbug Creek, Siskiyou county.

Supt. McGowan of the Senator mine, Arizona, is expected back from the East shortly.

George Taylor has succeeded George Horn as foreman of the Hathaway mine at Ophir, Placer county.

Charles Derby has been appointed superintendent of the Lady Washington in place of E. D. Boyle.

A. B. Wood, the copper mine king of Michigan, arrived in this city on Saturday, from Detroit.

Capt. Owens is superintendent of the mines of the El Paso Mining Co. at Alamo, Lower California.

J. H. Gillinwater of this city has been up in the mountains examining a mine near Volcanoville.

The Owens gold mine near Julian, San Diego county, has been sold to H. A. Williams of Massillon, O., for $50,000.

Louis Klefeker has applied for a patent for the Summit mine, one of the original locations on Tioga hill, Tuolumne county.

W. M. Fox, president of the West Con. Virginia Mining Co., returned the past week from a short summer vacation in the country.

Frank Billings of Angels, Calaveras county, who sailed for the gold-fields of Africa some months ago, has arrived safely and is now in Cape Town.

Robert Floorman, with A. H. Harris and others of St. Louis, are at Galena, Dakota, examining the Surprise mine, Ruby Gulch, with a view to its purchase.

C. M. Donaldson is manager of the Eureka and Excelsior Co.'s mines at Cracker Creek, Oregon, where the new mill is being erected; 150 men are employed.

Senator Jones of Nevada and Lon Hamilton, superintendent of the Chollar, Potosi, and other Comstock mines, have returned here from Santa Monica and will go to Virginia City in a few days.

David Neagle, the U. S. Deputy Marshal, who shot and killed Judge Terry at Lathrop on Wednesday last, because of an assault on Judge Field, was formerly a mining man of Tombstone, A. T., where he took several contracts for shaft-sinking.

Mr. D. B. Huntley made us a brief visit this week. Mr. Huntley was a resident of Arizona for some years and afterward conducted mining operations in the U. S. of Colombia. He prefers California, however, and is now on the lookout for a good mining proposition in this State.

John Maxwell, formerly superintendent of the Overman mine on the Comstock and lately of the New Idria quicksilver mine, will have charge and direct operations of the Hyde mine, Tuolumne county. The mine has recently been purchased by San Francisco men and will now be operated vigorously.

Prof. Thos. Egleston of the Columbia School of Mines of New York, and author of "The Metallurgy of Silver, Gold, and Mercury in the United States," is on a visit to this coast. While here last summer he was investigating the subject of gold milling. This time he is examining smelting works, and has been through Colorado, New Mexico and Arizona. After staying a few days in San Francisco he goes to Oregon, Washington, Idaho and Montana.

Assessment Notices.

ASSESSMENT NOTICE.

California & Nevada Railroad Company.—Location of principal place of business, San Francisco, California. Location of Railroad, Alameda County, California.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1889, an assessment, No 1, of Fifty Cents per share was levied upon the Capital Stock of the corporation, payable immediately in United States Gold Coin to the Secretary at the office of the Company, Room 12, No. 320 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of September, 1889, will be delinquent and advertised of sale at public auction, and unless payment is made before, will be sold on Monday, October 14th, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. A. PHELPS, Secretary.

Office, Room 12, No. 320 California Street, San Francisco, California.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of Principal place of Business, San Francisco, California. Location of Works, Placer County, California.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 13th day of August, 1889, an assessment, No. 14, of Four Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, 327 Pine Street, Room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of September, 1889, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 8th day of October, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

O. H. BOGART, Secretary.

Office, 327 Pine Street, Room 9, San Francisco, Cal.

Edwards' Works on the Steam Engine.

The American Steam Engineer, Theoretical and Practical; with Examples of the Latest and Most Approved American Practice in the Design and Construction of Steam Engines and Boilers of Every Description. For the use of Engineers, Machinists, Boiler-Makers and Students. By Emory Edwards, M. E. Illustrated by 77 engravings. 12mo, 419 pages $2.50

Modern American Marine Engines, Boilers and Screw Propellers. Their Design and Construction. Showing the Present Practice of the most Eminent Engineers and Marine Engine Builders in the United States. By Emory Edwards. Illustrated by 30 large and elaborate plates. 4to $5.00

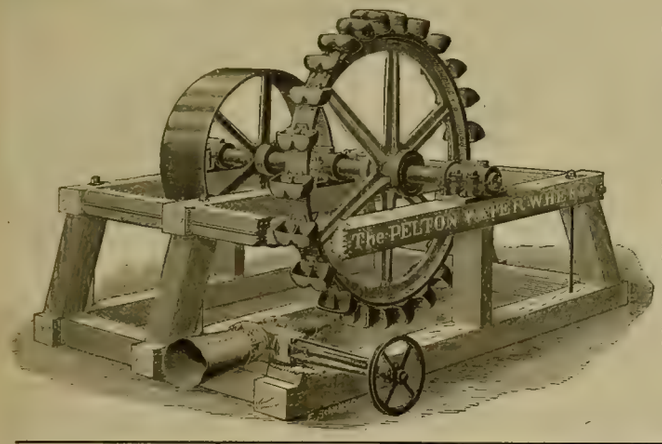
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.



Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 22, 1889.

General trade continues fairly active. Iron-workers and manufacturers report a slight increase in their branches of business. Money is still easy in the local markets, for as yet very little is going out for crop purposes, as the demand is chiefly met by interior banks and capitalists. When the country demand does set in, it is claimed that there will, for a short time, be considerable friction felt here. While this may be so, yet it is not at all unlikely but the expected call will be fully discounted.

In the speculative markets there is nothing doing outside of wheat futures to excite attention from outside operators, although mining stocks have been more active.

Considerable interest centers in the coming bimetallic convention to be held at Paris in next month for the purpose of discussing the silver problem. There is more or less discussion why France continues to strengthen her gold reserve—whether it is for prudential, political or financial reasons.

MEXICAN DOLLARS—The demand is only fair. It is generally claimed that after next month freer shipments will be made by Chinese. Quotations throughout the week have ruled at from 73½ to 74 cts.

SILVER—The market has held steady at from 92⅝ to 92¾ cts bid, with an advance of from ⅛ to ¼ cts paid. One of the banks is receiving refined silver from Omaha. This, it is said, the institution is forced to, so as to obtain supplies to meet their requirements. As the price here is better than in New York, the silver sent from Omaha nets more money to the seller. It is claimed that the receipts here barely meet the demand. European advices report the market dull but firm.

Refined silver closed to-day at 92¾ to 92⅞c. Both New York and London are reported unchanged.

QUICKSILVER—Receipts the past week aggregate 433 flasks. The market is reported dull and inactive but fairly firm in sympathy with European advices. Exports by sea the past week were as follows: Central America, 1 flask; Mexico, 10 flasks.

BORAX—Receipts the past week aggregate 858 ctls., and the exports by sea 100 ctls. to Mexico; 19,442 ctls. to New York; 20,928 ctls. to St. Paul. By the Southern Pacific railroad the overland shipments in last month aggregated 2593 ctls. The market is steady but firm.

LIME—Receipts the past week aggregate 5309 barrels. The consumptive demand continues free, with at times some shading in prices reported.

TIN—Shipments by sea the past week were as follows: Pig to Victoria, B. C., 4037 lbs.; plate to Victoria, B. C., 27,000 lbs.; to Nanaimo, 1479 lbs. The market for spot is duller, but holders still quote at previous prices. For shipment there is quite an advance, owing to higher markets abroad and also ships asking more money for outward cargoes. The stock in England is larger than it was a year ago, while in the Eastern cities the consumption is less, owing to a lessened pack of fruit.

COPPER—Elsewhere in to-day's paper is an editorial on the present situation from a statistical standpoint. The market is firmly held, and as the consumption is gaining on the stock, it looks as if still better prices are likely to be obtained later on, or at least early in 1890.

LEAD—Four hundred and ninety pigs were received the past week from London. The market is reported fairly steady, with a firm tone.

IRON—The markets abroad and at the East are reported very strong at further advances. In this city the market is dull, with prices easy under liberal supplies and light consumption.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow.	Aug. 14, '89.	Aug. 7, '89.
No 1 Coltness	59s 6d	57s 6d

No. 1 Eglinton	47s 6d	46s 6d
" Glengarnock	54s 6d	54s
" Dalmellington	49s 6d	48s

COAL—Imports the past week were as follows: Coos Bay, 1220 tons; Seattle, 1870; Australian, 21,390; total, 24,480 tons. The market is reported firm, with $7 bid for Australian prompt shipment. The free arrival of Australian, although provided for, gives liberal supplies and tends to lessened present requirements. English coals are strongly held, owing to the high asking rates for charters. In coast coals a good consumptive call is reported. Many families and other consumers are said to be laying in their winter supplies. Receipts the past week were light, and it is expected they will only be fair the coming week.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Aug. 21, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 5-16	92¼	$12 00	$3 87½	$20 30
Friday	42 5-16	92¼	12 00	3 92½	20 15
Saturday	42 5-16	92¼	12 00	3 90	20 20

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

NATIONAL AUTOMATIC DEVICE CO., Aug. 16. Capital stock, $1,000,000. Directors—P. W. Clark, P. L. Weaver, T. B. Berry, Walter A. Clark and J. S. Bailey.

LEADER PUBLISHING CO., Aug. 19. Capital stock. $10,000. Directors—J. Hendon Garnett, C. W. Dearborn, C. H. Hobart, Wm. P. Todd and H. F. Norris.

SAN FRANCISCO, TAMALPAIS & BOLINAS R. R. CO., Aug. 20. Object, to establish a ferry between San Francisco and Sausalito; to construct a railroad between Sausalito and a point at the base of Mt. Tamalpais, and between Sausalito and Bolinas bay. Directors—Harry L. Coleman, Frank P. Bacon, Thos. Brown, Chas. Page and Wm. F. Russell. Capital stock, $500,000.

FRESNO DEVELOPMENT AND PLANTING CO., Aug. 20. Directors—N. J. Bird, Robert Husband, W. W. Broughton, G. W. Darborn and Geo. T. Prescott. Capital stock, $100,000.

CONSOLIDATED GOLDEN GATE SULPHURET MINING AND DEVELOPMENT CO., Aug. 20. Capital stock, $6,000,000. Directors—J. A. Fischer, E. C. Loftus, Charles J. Behlow, Benjamin F. Fischer and W. G. Long.

GOLD MOUNTAIN AND DRY GULCH CONS. M. CO., Aug. 20. Location, Oregon. Capital stock, $2,000,000. Directors—R. B. Cannon, R. H. Miller, A. W. McPherson, Ed. H. Fleming and F. E. Austin.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

AT the last meeting of the California Academy of Sciences, Fr. Gutzkow read a paper on "Aluminum as a Metal." He demonstrated that the present methods of reducing the metal were too expensive to cause its general use.

Mining Share Market.

Mining stocks the past week gravitated, with slight fluctuations, to lower figures for the Comstocks, and this, too, in the face of the action of those reported shrewd operators, Finlay and Spring, in trying to build up confidence in the market with the "mudhens" and "gutter-snipes" through the *Post* and *Report*, so it is claimed, to promote a bull movement. The crawfishing so far of the market is, no doubt, a source of surprise to many patrons of the two papers, yet they must have confidence in their journalists' ultimate success when combined with Senator Jones' anticipated visit to Virginia City. Outside of the few chronic bulls on Pine street and "Pauper alley," the large proportion of outside dealers have little faith in the market, believing that the time is not ripe for much of a move. There is a growing impression in certain quarters that quite a line of small shorts is on the market, and in consequence a spurt in stocks may take place any day so as to make the smaller operators fill. Attention is still being attracted to the North End mines, but experienced miners are confident that the best results are to be obtained in the Gold Hill and Middle mines. In the outside stocks, the Quijotoas and Bodies have been fairly steady under light trading, while the Tuscaroras shaded off some. In Eureka and Silver King nothing has been done.

From the mines there is nothing of importance in an official way from the Comstocks, yet private advices are indicative of large and extensive deadwork going on in the Gold Hill mines, which has for its object the opening up of several levels running from Yellow Jacket and south to Bullion, and farther north, even as far north as Savage. The 500-foot north drift from the Yellow Jacket shaft is about 375 feet in Con. Imperial ground. The work in this drift, it is said, will be prosecuted until connection is made with the 800-foot level in Alpha. The Alpha shaft is to be sunk 100 feet deeper, when a west crosscut will be started to cut the west ledge found on the 500-foot level, mention of which was made last week.

The drift in the 700-foot level in Potosi is within a few feet of the Bullion. In running this drift, they passed through a body of white quartz from 35 to 40 feet wide, giving low assays. This drift will be run to form a connection with a west drift from the 800-foot level from the Ward shaft. This will also connect with the 500-foot drift from the Yellow Jacket shaft, which will give excellent ventilation through several mines. The 1000-foot drift has been connected through the different mines from Crown Point to Overman. The winze from Seg. Belcher and Belcher has been connected with the 1300-foot level, which gives the best of ventilation so as to prospect from the Sutro tunnel level the rich ground in Crown Point, Belcher and Seg. Belcher. The west crosscut on the 500-foot level of Yellow Jacket, it is claimed, is being pushed ahead so as to cut a rich gold ledge lying to the west. It is claimed that all differences between the middle grop of mines, Alpha, Bullion and other Gold Hill mines, have been amicably settled and work in two or three of the mines can by the new arrangements be better prosecuted. Of necessity, the work outlined by the various companies means time and an expenditure of considerable money. Quijotoa advices are more hopeful, yet not much result is looked for from them before November. Well-known and reliable mining men are very hopeful of the Tuscarora mines. They say that several of them are rich in mineral and that it is only a question of a short time when they will be worked more advantageously. Official advices from Bodie and Mono report the cutting, in each mine, of a streak of rich ore. This is more cheering than rich bowlders, but it would have been much better if the width and assay value had been given. Our advices are still of a very hopeful character.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

ELECTRICAL SOCIETY.—At the last meeting of the Electrical Society, the members listened to the demonstration and reading of an article lately published by Patrick Delaney of New York, on "Cable Telegraphy and the Delaney Line Adjuster," an invention by which long currents can be conveyed by sound, and at a speed two to three times greater than the one in common use. The demonstration was made by Prof. Keith by means of a blackboard, and was attentively followed by the members who were present.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Pressed Brick and Terra-Cotta.

A company has been organized in this city under the name of the Union Pressed Brick and Terra-Cotta Company, with Mr. J. H. Wise, ex-Harbor Commissioner, as president, and C. S. Preble, secretary. The directors are: J. H. Wise, C. H. Frost, O. E. Moore, H. T. Scott, T. H. Downing, S. G. Hilborn and W. Z. Price. The works, which are on an extensive scale, are located at Vallejo, where the company owns an inexhaustible body of very fine clay peculiarly adapted to their purposes. From 50 to 100 men will be employed, and about 24,000 brick per day can be turned out. Terra-cotta from the same material and in all designs will be manufactured to order.

The company make use of a peculiar and rapid dry process. Within three minutes from the time the clay enters the machine the bricks are ready for the kiln. The pressure employed in molding is enormous and leaves the brick before burning nearly as hard as the burnt brick made in the old way. Quite a variety of color can be produced—Indian red, dark brown, bright yellow, etc.—and the finished product is very handsome, smooth as polished granite and as hard. They will sustain immense crushing force and are also fireproof. Architects and those who contemplate building are invited to visit the company's office, room 31, in the Flood building, and inspect samples.

Native and Foreign Hard Woods

Among the oldest and largest lumber firms in San Francisco is that of John Wigmore & Son, dealers in domestic and foreign hard woods, Nos. 129 to 147 Spear street. They keep constantly on hand a large stock suitable for furniture and cabinet making, fine house finish, car and wagon work, ship building, etc. There is also a branch establishment at Los Angeles, under the firm name of John Wigmore & Co., where, in addition to the above stock, is carried a complete line of carriage materials and hardware, bar iron, steel and general blacksmiths' tools and supplies.

No firm on the coast is better equipped for conducting large transactions, nor do any stand higher in a commercial sense. Readers of this paper will note their advertisement in another column.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

NEWSPAPER AGENTS WANTED.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

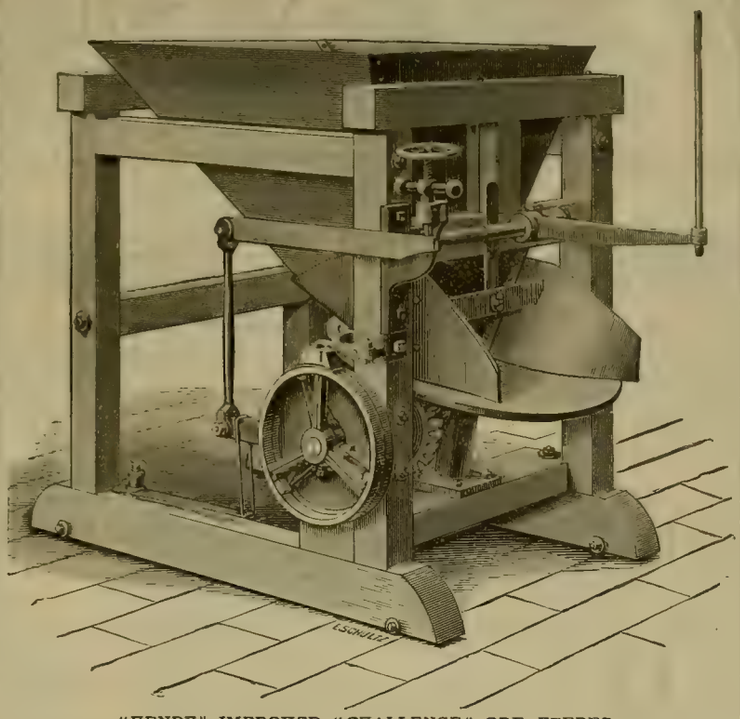
Books on Working Ores.

BY GUIDO KUSTEL, M. E.



ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore ithout quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $8, cein, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & Co., S. F.

—THE—
JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application

CARBON PAINT.

CARBON PAINT CO. TRADE CP MARK SAN FRANCISCO, CAL.

The most durable and effective Roof Paint in the world is now for the first time offered for sale in this market. A practical trial of it of over five years, in States and Territory where the right to manufacture it under our patent has been sold, demonstrates that for shingle or tin roofs, wood or iron bridges, undergronnd pipes, etc., it is the best and most durable paint yet discovered. It never cracks under any extremes of temperature, and it is guaranteed *never* to rust or corrode any metallic surface. As a protection against salt water it defies competition. Neither acid nor coal smoke affects Carbon Paint, and as it requires nearly a ree heat to destrov its protective qualities, it is peculiarly adapted for Fire Engines, Smoke-stacks, etc. Good, responsible Agents wanted throughout this coast. Liberal terms offered. Send for Circulars.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

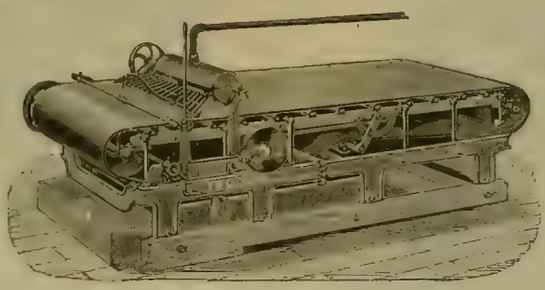
For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.



ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID MCKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PACIFIC IRON WORKS

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

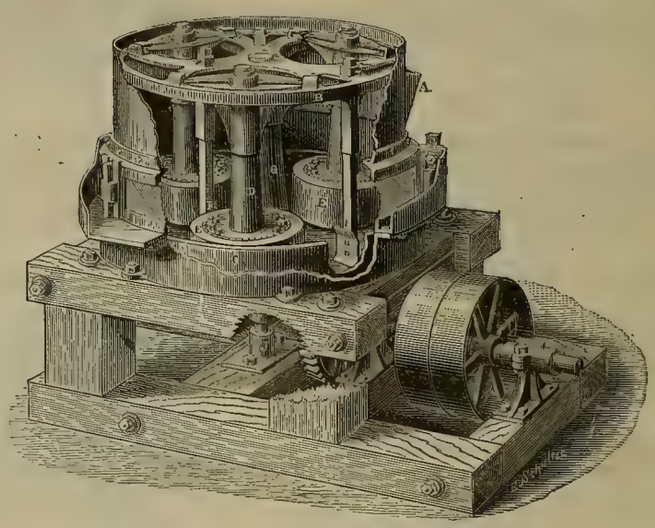
MANUFACTURER AND DEALER IN

MINING MACHINERY.



Cal State Library Jl '80

Huntington's Improved Rock-Breaker.

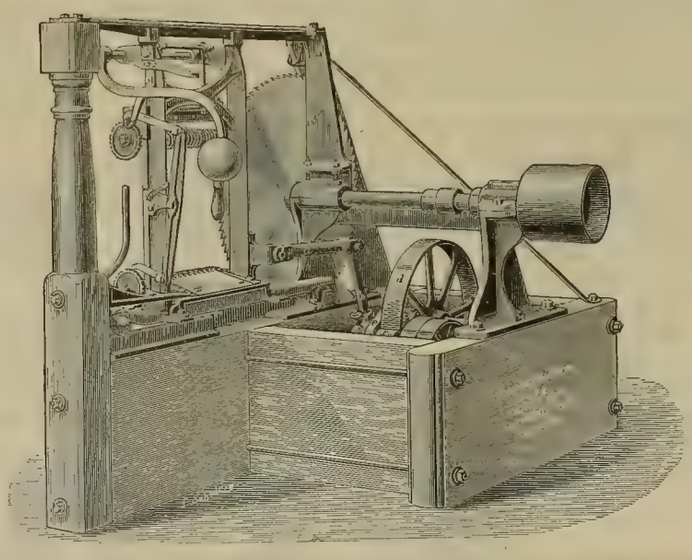
The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.



The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S
PATENT SHINGLE MACHINE.

This Machine is so well and favorably known by all the principal Lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. This feed-works is positive and uniform in its action and obviates all the jar or tremor formerly given to the machine by the weight used in the old style feed.

For simplicity, durability and rapidity of action, these machines have no equal, cutting from 50,000 to 75,500 shingles per day.

Price, complete with Jointer and one 38-inch Saw, $475.00.

The new feed-works can be applied to any of the old machines.

Price $100.

METHOD OF OPERATING THE ELEVATORS ON THE EIFFEL TOWER.

The Elevators of the Eiffel Tower.

Their Construction and Operation.

When it became a question of elevating visitors from the second platform to the summit of the Eiffel tower, at the Paris Exposition, seven commissioners were appointed, who, after mature examination, decided to adopt the plan of M. Edoux, which combined all the advantages of others proposed without their inconveniences, a specimen of which had been in operation for ten years at the Trocadero without an accident.

The usual apparatus of M. Edoux consists essentially in a metallic piston, the hight of which is the distance to be traversed, moving in a vertical cylinder and bearing at its upper part the car or cabin for passengers, and kept in equilibrium by counter-balance-weights properly calculated and disposed. This system could not, however, be applied in its ordinary form to the tower, because of the imposed condition that none of the means destined for the working of the apparatus should go below the second floor.

M. Edoux got over the difficulty in a very ingenious manner without changing, so to say, anything typical in his apparatus. The vertical distance to be traversed, comprised between the second story and the summit of the tower, is 160m.40; now let us suppose it divided into two parts of 80m.20 each, and let us fix in thought a floor intermediate at this level. Considering this floor as the point of departure of an ordinary elevator, this last could traverse all the part above, to the summit of the tower, while its counter-weights, of which the point of departure would be the same floor, would go from the latter to the second story.

If now we replace these counter-weights by a cabin or cage, we easily see that we will be able to traverse in this way all the hight of the 160m.40. Such, in its great lines, is this remarkable project, which resolves a problem absolutely new, in employing principles long established and sanctioned by several years of practice. The metallic *ossature* is formed by a *poutre-caisson* in the center of the tower, of the hight of 160m.40, and by two other *poutres* of smaller section, one extending from the second story to the intermediate floor and the other from this last floor to the summit of the tower. These several *poutres* are united by cross-pieces to the metallic walls, and are designed to support the guides of the car or cage. One of these cars, designated by the letter *A*, in the engravings, rests upon two pistons of hydraulic press, giving to both a section of 1600 square centimeters. These pistons are articulated at their upper part, on a *palonnier*, the center of which supports the cabin. The latter ascends without concussions, not being influenced by the variations of speed of the pistons. These variations, moreover, are hardly appreciable, since they can only result from the friction of the packing of the pistons. Four cables go from the cage, *A*, and from the

The Northern Counties of California.

[NUMBER 10.]

Metals and Minerals of Economic Value.

[Written for the PRESS by JAMES H. CROSSMAN.]

For a description of California's carbonaceous and hydro-carbonaceous minerals and their volatile products we refer our readers to the 7th annual report of our State Mineralogist, Wm. Irelan, Jr., which contains a valuable treatise on petroleum, asphaltum, natural gas, and the coal of our State, by Adolph H. Weber and W. A. Goodyear, assistants in the field during the summer and autumn of 1887.

Scientists differ widely as to whether natural gas will be found in sufficient quantities in any part of California to become of economic value, owing to the rocky formation having been by dynamic influences crushed, fractured, faulted, and the strata, as a rule, upturned on their edges at varying angles, permitting the larger portion of oil and volatile gas that had been generated and confined in subterranean reservoirs to escape through fissures and interstices of the rocky formation during the period that these changes took place, or subsequent to that time.

Natural Gas.

But we should bear in mind that Prof. Whitney, our State Geologist from 1866 to 1868, after a careful examination of the hydro-carboniferous formation of our southern counties that are now producing so largely, was emphatic in his statements that petroleum (natural gas as a fuel and illuminant not then known) could not be found in California in paying quantities, owing to precisely the same reason and with the same line of argument. At this date its production has become an important industry and has added largely to California's prosperity, rendering us, in a measure, independent of the foreign product. The learned professor was evidently at fault in his geological deductions, as the statistics of California's production of oil for the past nine years stand as follows:

Year.	Gallons.
1879	568,806
1880	1,763,215
1881	4 194,102
1882	5,462,671
1883	6,000,000
1884	6 000.000
1885	8,760,000
1886	10,950,000
1887	28,500,000
1888	27,000,000
Total	99,138,794

In fact, such has been the development in the past year that many think that we have as large resources as Pennsylvania. It should be borne in mind that Mendocino and Humboldt counties are possessed of more than 40 square miles of superficial area that contain these hydrocarbonaceous products (petroleum, asphaltum and natural gas). These fields are comparatively virgin and require not only capital but practical experience to develop them. The little that has been done has been merely surface scratching, particularly when we take into consideration that in order to get a flow of natural gas in the Westinghouse well at Pittsburg, Pa., it was found necessary to sink to a depth of 4618 feet, which was 2000 feet below the level of the sea. Other deep wells in New York and Pennsylvania vary from 3000 to 4000 feet in depth before an abundant flow is obtained. It is this new fuel that gives new vigor and life, pith and moment to Eastern manufactures. Why should California be behind in the race? We have the material; let us utilize it.

At this date all that our State requires to make her thoroughly self-supporting and independent of the world, and one of its great manufacturing centers, is cheap fuel. If we can find natural gas in sufficient quantities, the problem is solved. We have iron, copper, lead, antimony, arsenic, zinc and sulphur for our smelters, foundries and reduction works in unlimited quantities; virgin forests of pines, oaks and other varieties of woods, with superior qualities of marbles, granites, sandstones, lime, clay, etc., for structural purposes.

With this new fuel we can successfully treat our base metal ores at home, thereby saving the heavy expense of transportation and foreign reduction. We can build ships and railroads with domestic iron and compete with the most favored nations in that industry. Though natural gas has been known to exist in our State in considerable quantities, it has not as yet been utilized to any extent.

Where Gas Has Been Found.

In Sonoma county a well has recently been bored in which a regular flow of natural gas has been struck yielding 4,000,000 cubic feet, which is allowed to run to waste. This, if utilized, would prove a "treasure-trove" to the owner of the well and of great value to our manufactories. In the vicinity of Stockton, in San Joaquin county, there are several wells, one of which has reached a depth in excess of 3000 feet. From these wells the flow of gas is sufficient to warrant its introduction as an illuminant in that city in place of gas. It is also being used in furnaces for steam purposes in place of coal.

Antimony, Arsenic and Zinc.

A well-defined vein of antimonial ore assaying 20 per cent and from 8 to 30 inches wide occurs near Dunsmuir, Siskiyou county, in the Humbug mining district. It also occurs in combination with arsenic and zinc, forming the bases of the auriferous ores of that locality; also in Modoc and Del Norte counties. But neither of these bases are in sufficient quantities to warrant treatment of the ores for those metals alone.

Basalt and Trap

Occur in immense quantities in the southeast portion of Siskiyou county, where the latter is used for structural purposes by the Oregon & California railroad, and also for culverts and the abutments for their numerous bridges. These minerals have a columnar structure and readily fracture at right angles with the face. They are of great strength and impervious to fire. They are also abundant in Modoc county.

Clay

Of a superior quality for fire-brick and pottery purposes abounds in these five northern counties. In Modoc county a bed of kaolin (porcelain clay) has been discovered near Hot Spring valley.

Calcite

Of good quality, free from foreign substances, is found in large quantities near the Oregon & California railroad, five miles from Yreka, Siskiyou county, suitable for lime.

Coal.

A bed of lignite occurs on Anderson's ranch, in Shasta valley, Siskiyou county; extent and value undetermined; also in Modoc, Mendocino and Humboldt counties. In the latter county a bed of bituminous coal 4 feet thick, of a superior quality, has been discovered on the Ray ranch, Tp. 4, S. R. 4 E. meridian. It is stated that this coal cokes well. It has also been found in a number of other localities in both Mendocino and Humboldt counties; formation sandstone.

Copper.

The ores of this metal are found on Humbug creek, Siskiyou county, in place; also on Slide creek. The croppings are traceable on the surface for more than three miles. At Callahan's ranch copper occurs in a metallic form with the alluvions; also at Bissel Bar, Humbug gulch and on the north fork of the Salmon river, at Altaville, Del Norte county, and in Mendocino, in Coyote, Potter and Walkers valleys, and in Surprise valley of Modoc county as well. In every instance the occurrence is so remote from tidewater and railroad facilities that no developments have been made.

Galena

Is found in Scotts valley in veins and extensive caves that occur in the Limestone range near McBride's ranch. This galena carries but a small percentage of silver.

Iron.

The northern counties of California are especially noted for extensive beds and deposits of chromic iron ore containing an unusually high percentage of chromic acid, particularly the beds in Del Norte county, near Altaville, and near the Forest house in Siskiyou county. The latter ore contains 60 per cent of chromic acid. It is found as float in huge blocks, but for want of a market, it never has been utilized or traced to its source. It is also found in Shasta valley, near Anderson ranch. These ore bodies invariably occur in serpentine. Beds of hematite are occasionally seen, but are not extensive. The largest bed is situated three miles from Dunsmuir.

In Humboldt county nature's concentrations of the beach sands are largely composed of auriferous and magnetic iron, (titaniferous) which are gathered and washed by the "beach miner" for their golden contents. The residue composed of this valuable ore of iron is thrown away in quantities sufficient to warrant the erection of reduction works for the manufacture of steel.

Mercury.

Cinnabar, an ore of this metal, occurs in place at a point four miles below Oak Bar, on the Klamath river, Siskiyou county; also as float on the head of the west branch of Beaver creek, near Mt. Sterling, where it is found in sufficient quantities to have warranted the erection of a retort for its reduction. Its source has not been discovered. The ores are of an unusually high tenor in quicksilver. It has also been found at a point near the southern boundary of the county; and on White Gulch and Russian creek on the headwaters of McCloud river, cinnabar is found in considerable quantities.

Mineral Earth

Of the ocher variety, suitable for paint, is found at Hayden valley, near Callahan's ranch, on Scott river, Siskiyou county, and near Bailey's ranch on the Klamath, the latter of a superior quality; colors, bright reddish, brownish and yellowish. It is also found in Modoc and Del Norte counties.

Marble.

Marble mountain, a notable and prominent landmark in Siskiyon county, is wholly composed of this stone. Its bold craggy peaks, vertical cliffs, deep chasms glistening in the sun, present a striking and attractive feature. At Etna in Scott valley a marble quarry has been opened and mill erected. The product has a local demand for ornamental and building purposes. The quarry, though yet in its infancy, gives promise of proving of great value. It contains two varieties of stone—a clouded mottled and veined marble, and also a pure white crystalline, free from foreign matter, fracture or cracks. It is suitable for statuary purposes, cutting easily and smooth with sharp lines. With railroad facilities this product would meet with a ready sale in San Francisco and elsewhere.

Aragonite, a species of onyx, is found near Dunsmuir in vein, but not extensive; marble also occurs in Humboldt and Mendocino counties in several localities.

Native Silver

Is found in all the water-courses that are tributary to Indian creek, a branch of the Klamath river. This metallic product is found in the alluvions of this region in about equal proportions in weight to the gold. Its source has not been discovered.

Precious Stones.

Several diamonds are said to have been discovered by the miners in cleaning up their sluices at Hamburg Bar, Siskiyou county. Mr. Stutts of that place has a small one in his possession that he so found.

Chalcedony and agates are abundant in the mountain ranges skirting Shasta valley, particularly in the Black mountains.

Opals are found in Modoc county, four miles from Adin, varying in size from a pea to a bean, and partaking of their shape. They are smoothly rounded and when cut receive a high polish. Of 100 specimens that were sent to a lapidary in New York it is reported that five of them proved to be gems of considerable value. They are found in place resembling plums in a pudding. The matrix is a decomposed talcose argillaceous formation. They are also found with the alluvions in the water-courses that head in the bed.

Platinum and Osmi-Iridium.

These metals are found in the alluvial washings of the east fork of the Salmon river, Siskiyou county, ten miles above the mouth of Shattuck creek, in sufficient quantity to be of great annoyance to the placer miner when cleaning his gold from extraneous matter, the specific gravity rendering it difficult to separate, and the quantity not being sufficient to make a specialty of saving it. Mr. Ball, a prominent mine-owner in Siskiyou county, reports the occurrence of platinum in place in a quartz mine that he is working on Methodist creek. In Humboldt county both platinum and osmi-iridium occur in the black sands of the beach at Gold Bluff in considerable quantities.

Pumicestone

Of a good quality is found in the "lava-fields" east of Montague, Siskiyou county; also in Modoc county, in the "lava-beds."

Plumbago.

Graphite (the black lead of commerce) of a good quality occurs in place in the vicinity of the Black Bear mine, Siskiyou county; also in considerable quantities at Gasquet, near Crescent City, Del Norte county.

Roofing Slate

Is found on the banks of the Klamath river three miles above Orleans Bar, and also in Humboldt and Del Norte counties.

Sandstone.

Humboldt, Mendocino and Siskiyou counties contain extensive reefs of sandstone suitable for structural purposes, particularly in the latter county. Mr. Scobie, the C. P. R. R. expert in stones for structural purposes, pronounces them quite equal to the celebrated imported Scotch stone. They vary in color, hardness and tensile strength. Gray, drab and blue of various shades are seen. The stone cuts soft and hardens on exposure. It dresses smooth and splits with the wedge perfectly true. In one of the two quarries near Yreka I measured a block that had been quarried ready for dressing. Its dimension was 6 by 6 by 17 feet. The strata varies from two to ten feet in thickness and lays dipping east at a small angle of inclination, in fact nearly horizontal. In Yreka it is used for flagging and structural purposes. The courthouse and other public buildings are built of this stone. Near Henley, in the vicinity of the Oregon & California railroad, another quarry has been opened. This stone is a dark gray and blue, hard and susceptible of a polish.

Steatite

(The soapstone of commerce) occurs in several localities in Siskiyou county. It is equal to the best imported and is entirely free from grit or silicious matter. It cuts easily with a saw and is susceptible of a polish. It is found in vein at Oak and Hamburg bars, on the Klamath, in Scott valley, between Fort Jones and Etna; also at a point 1½ miles from Dunsmuir a vein has been discovered five feet in width. This stone is used for fire-fronts, fire-brick, stove linings and for ornamental purposes.

SMOKELESS COAL.—A new kind of coal, making but little smoke, is being used by the Powell-street cable road with satisfaction both to the company and the residents in the neighborhood. The coal was recently discovered in British Columbia. It leaves but little ashes, and gives better results than that the company has been using.

THE hoist plant of the Plymouth Con. mine, in Amador county, was recently sold for $75,000 by Messrs. Hayward & Hobart. The plant will be shipped to the Mulatos mine, in Old Mexico.

The Stewart Mining Bill.

A Miner's Opinion.

EDITORS PRESS:—In a copy of the MINING AND SCIENTIFIC PRESS of Aug. 10, 1889, I saw the bill Senator Stewart intends to introduce at the next session of Congress. I do not think that Senator Stewart's bill will be of any benefit to mining or mining resources, or any encouragement to prospectors. The Senator states in his bill that no person shall acquire by location more than 1500 feet on the same vein. I will first call his attention to this point. How many mines are located where the apex of the vein or ledge is traceable for 1500 lineal feet along the surface, and when an applicant can positively swear that it is the same identical vein for the said 1500 feet? Now for the sake of argument I will answer that question. There is not one mine in a hundred that is located where the apex of the ledge is traceable for 1500 feet.

Now I will suppose that John Doe makes a location and takes up 1500 feet along the course of the ledge and has his location monument and his discovery shaft on the center of his claim, and he finds that the course of his ledge is running north and south. He names his mine No. 1, and still he takes up another claim on the north end of No. 1 and calls it No. 2. Now Mr. Roe comes along and sees these two claims taken up, and he says to Mr. Doe: "You have two claims on the same vein, and under the law of the United States you can only hold one." Mr. Doe says that he has but one claim on the same ledge, and that they are two separate and distinct ledges running parallel with each other. And if Mr. Roe thinks that these two claims are on the same ledge, it is for him to prove it. Now what will the applicant have to do to prove that these two claims are on the same vein? Before he can get a bona fide title to No. 2 claim he will have to commence at the discovery shaft of No. 2 claim and take the surface from off the apex of the vein until he comes to the discovery shaft of No. 1. If the apex does not come to the surface, he will have to sink a prospect shaft at the discovery point of No. 2 and run a drift along the ledge until he comes to the discovery shaft of No. 1, which would be 1500 feet, before he, Mr. Roe, could dispossess Mr. Doe of No. 2 claim.

Now I will ask how many prospectors are there that can afford to enter into litigation where it would require so much labor and expense to prove a bona fide title to the mine. When Mr. Roe would get through with the law and the lawyers, even if he had a mine that would be worth $100,000, he would come out at the little end of the horn.

I think that Senator Stewart's idea is to keep prospectors from monopolizing mining camps, but he has taken the wrong track to do it. If he wants to keep prospectors from monopolizing mines or mining camps, he should make a law to the effect that no person can hold more than one quartz claim either by location or possession in one mining camp, and one placer claim of 20 acres at one time, and at any time that he feels like abandoning them he could do so by posting a notice to that effect. Then he would be at liberty to make another location, but he should specify in his notice his abandonment of his previous location.

The principal point in making mining laws is to avoid litigation as much as possible and to make them as plain as possible, so they can be easily understood, for all men are not born lawyers. I think that the old mining law of 1872 is good enough, with the exception of two clauses—that is, that no person can relocate a claim that he previously located, and the day of relocation be on the 1st of October instead of the 1st of January.

If a prospector has energy and ambition enough to prospect the unexplored mountains of the U. S., he ought to be entitled to all that he may find in regard to mineral, and make all the locations that he pleases, whether it is on the same vein or not. Some one may come along that never spent $1 in prospecting, nor never knew what it was to bear the hardships of a prospector's life; some one who never spread his blankets on the mountain-tops or made a spring mattress out of sagebrush, and would reap the same benefit out of his find under Senator Stewart's new law. The average prospector and miner is well versed in the Mining law of 1872, and to change it to any extent, it would be years before the greatest portion of them would thoroughly understand how to take up a mining claim and hold it legally. No person need be alarmed that either the capitalist, miner or prospector will monopolize the mining industry of the U. S. under the Mining law of 1872, nor will it be controlled by a trust company. On the other hand, the mining industry of the U. S. is too extensive, and there are too many rich mines and mining camps springing up every day to be controlled by any capitalist, miner or prospector. It is through the energetic prospector that all these rich mines and mining camps come to the front. Why do we want to make a law that will impede the ambition that was given him by Nature? If we do we will impede the capitalist and the prosperity of our mining industry.

MINER.

Willow Creek, Humboldt Co., Nev.

PENNSYLVANIA OIL.—Pennsylvania produced over 16,000,000 barrels of petroleum last year, and Ohio 10,000,000. Five years ago the production of Ohio wasn't worth noticing.

Best's Steam Harvester.

Daniel Best of San Leandro, Alameda county, is one of our best-known California inventors in the line of agricultural machinery. During the 20 years that he has been engaged in inventing and manufacturing in this State and Oregon, he has sent out a number of devices which have been found valuable, but he considers his steam harvester, which he is now manufacturing largely, his chief work, and certainly the early performances of the outfit in the field this season warrant him in assuming considerable confidence. As the machine is one of the very important class of combined harvesters which California has given to the world, we take a local pride in making it more widely known to our readers. The engraving on this page shows the engine and harvester as it is when in actual operation, the picture having been drawn from a photograph taken in the field.

The chief components of the combined machine are two—the traction engine which gives the locomotion, and the harvester which has its cutting and cleaning machinery operated by an auxiliary engine which takes its steam by means of a flexible pipe from the boiler of the traction engine. Thus the harvester is independent in action, and the speed of its operating parts has nothing to do with its locomotion—a feature of great importance when the harvester is working in trying situations.

The traction engine shown in the engraving was patented by D. L. Remington of Oregon, but as now manufactured by Mr. Best, it includes important patents of his own. The boilers of these engines are of steel and are a modification of the vertical and horizontal combined; main body being upright, four feet in diameter, be multiplied 25 times by means of its application to the rims of the wheels instead of centrally to the axle.

The engraving shows also the Best combined harvester as it is used with the traction engine. As has been said, an auxiliary engine is used on the harvester, taking steam through a flexible steam pipe from the boiler of the traction engine, doing away with all gearing necessary to run the harvester, the effect being a steady, uniform motion at all times and conditions of the grain, and at any speed that the harvester may be traveling. For fuel, straw, wood or coal can be used, the straw being taken from the rear of the separator by a conveyor to the furnace door of the engine, being very convenient to fire. This harvester cuts a swath 25 feet wide, and with the engine can be moved at the rate of three miles per hour, and will harvest from 65 to 100 acres per day. This harvester has made an excellent record in the field this year, and will be pushed next season.

Of the traction engines as now made by Mr. Best, four have been used this year. J. S. Butler took out the first engine last January, used it during the winter for plowing and replowing, harrowing and grubbing land, and then hauled his harvester with it. W. Fennell of Tehama took out his engine in February and used it for plowing until time for running the harvester. Kester & Peters of St. Johns, Colusa county, have the first of Best's full-rig steam harvester and engine, and have used it successfully. Henry Best of Yuba City used his rig for harvesting and is now hauling grain from the fields to the shipping-points.

Mr. Best has great confidence in his engine for steam plowing. A draw-bar is attached to the engine, to which are hitched whatever number of plows are desired. Take for example a dozen plows, and the engine moving at three miles an hour, or about twice as fast as a team, and one can easily figure how much land it will turn in a day. The manufacturer holds that it will do the work of 75 mules and can be

DANIEL BEST'S STEAM-HARVESTING OUTFIT; INCLUDING TRACTION ENGINE AND COMBINED HARVESTER.

with 160 two-inch flues five feet long; the fire-box is horizontal, 6½ feet long, 44 inches wide and 36 inches high, staybolted in the most perfect manner. A most important feature of the boiler is the combustion chamber, in which the smoke is burned and the sparks and cinders are caught. This makes the boiler safe from communicating fire, and it is said that smoke only appears from the stack when starting up.

Attached to the boiler are wrought-iron bed plates, 6 inches by 1 inch thick, which form the main frame for all of the machinery. To the said bed plates are attached Duplex engines 9x9 geared to the inner circumference of the two large drive-wheels. Five gear pinions and wheels constitute the whole gear. The application of the power directly to the rim of the wheels gives the engine wonderful drawing-power as compared with gearing near the axle. The weight is balanced upon the two main wheels, which are 8 feet in diameter and 26 inches face. These large wheels so strongly geared are able not only to pull an immense weight, but can surmount obstacles, such as running over logs and raising out of holes and depressions which would seem to be impossible. The value of this feature has been proved in the use which has been made of the engine in the logging regions and in clearing land. The whole weight of the engine, which is about 11 tons with the water-tank filled, is applied directly to the lifting of cogs in the segments on the inside of the rim of the wheel, and the heavier the pull the tighter the wheel sticks to the ground. The gear is differential, so that each wheel acts independently and can turn in a 16-foot circle, or can turn a square corner with the harvester attached. The lead or steer wheel is 5 feet diameter and 16 inches face with a central flange to take hold in the ground. It is easily operated by the engineer by means of ingenious and effective steering apparatus. The twin engines develop 40-horse power with 100 pounds pressure, and 60-horse power with 150 pounds pressure, and this power is believed to operated for the cost of the barley which they would consume.

Mr. Best has been adding many improvements to his shops at San Leandro and calculates to finish up one engine per week. He has now a number of orders ahead and expects that his rigs will do much plowing this fall and winter.

Drift Mining.—The Hidden Treasure drift mine, Placer county, is yielding low-grade gravel, but it pays. In the last "run" 52,551 carloads of gravel were taken out, averaging 3000 pounds each, yielding $81,249.45 in gold, from which a dividend was declared of $29,340. As the gross yield per carload was only $1 54, this shows admirable management on the part of Harold Power, the superintendent, especially when it is known that the mine has 8000 feet of very bad tunnel to keep up and is one of the hardest mines to work in the district. Competent mining experts in Placer county say that there are over 200 miles of just as good mining ground still unworked in that county.

Hydraulic Miners Released.—Fie Kie and others have been released by the Supreme Court on a writ of habeas corpus from the custody of the sheriff of Yuba county. They had been fined $500 for hydraulic mining, contrary to law, but the Supreme Court decided that a sentence to hard labor was not proper as a punishment in addition to a fine.

Very rich ore is coming out of the Idaho mine, Grass Valley, at a point near the Maryland mine. The latter will doubtless prove as good as the famous Idaho when properly opened and worked. It is a wonder it has not long since been equipped for extensive operations.

A Boat at One Blow.—It is now proposed to strike a boat from a die, virtually in one piece of mild steel, with no rivets except where fittings are attached.

Unprospected Lands.

A Hungry Creek correspondent of the Yreka (Siskiyou county) *Journal* sends in the following: There is a large tract of land on the line of California and Oregon in this county that has not been prospected. Little is known of its mineral and agricultural resources except by cattlemen. It is one of the best stock ranges in the State, as the stock in their fat and sleek appearance prove. Near the line of Oregon the Beaver river leaves the gold belt and enters a sandstone formation, from which point I will describe. Deer creek has been worked at the mouth, but I think it did not pay much, as it is a mass of bowlders to within three miles of the summit. There it opens out into beautiful level glades covered with grass. In one of those glades Mr. Flatt has been placer mining for over a year. He is making wages although he has very little water. In the next glade James Sterling took out $250, and in another glade two men have just stopped work, the water giving out, who told me the claim paid, and are going back next spring. I tried two other glades and found gold but no water. The gold is full of quartz, and there are several quartz ledges crossing the head of those glades. Soda creek has four large glades with lots of grass. Prospected it for placers, but did not find much. The same ledges that cross Deer creek cross it. Bear creek is a large basin, full of glades with grass and water. Found gold in its tributaries, also noted several quartz ledges. The west branch of Beaver has been worked at the mouth to within five miles of the summit. Nuggets from $30 to $80 have been found within two miles of the summit. Its tributaries are not prospected. Did not prospect the quartz ledges, my time being occupied with the quicksilver mine. No wonder it did not pay. Of all the rat-traps for reducing work that company ought to get the cake. I don't think they are on the ledge. A short distance above their works I found a light-colored clay, conglomerate mass, quartz, ore, rock and silicons, which accompany quicksilver mines in this State. The formation for gold in these creeks is good, the same as Applegate, both heading in the same mountains. The only reason I can give for one being richer than the other is: Applegate being on the northern side of the Siskiyou mountains, is exposed to the dampness, which has worn the mountains and deposited the gold in the gulches. It is the reverse with these creeks. They are on the southern side and are protected by the mountains. The wear is not one-quarter as much and three-fourths of the gold is in the mountains.

Open Your Mines.—There are persons owning mining claims in this district who never have nor never will develop them. They have located them for the sole purpose of speculation, thereby keeping miners who would work away from the camp. They expect some one to come in and develop the country while they sit around on the street corners and tell strangers what a fine mining camp we have. Such persons are a detriment to the camp, and the sooner they get up and go away the better it will be for the camp. There are a few persons here that are doing all they can to develop their property, but the remainder are sitting around waiting to reap the benefit of their work. Now go to work and open your mines so a person who wants to buy can see there is something in them, or get out. There is no longer room for drones here.—*Julian Sentinel.*

A New Pipe Threader.—Mr. Mulkley, of No. 1 Crankshall Lane, Wendsbury, Staffordshire, England, has just invented a new machine for cutting threads on pipes of all sizes from 2 inches to 24 inches in diameter. It is claimed that this machine will save at least 50 per cent in labor and steel over any other machine now made.

Are Water Rights Mining Property?—The Supreme Court has heard oral arguments in a suit of general interest to miners. The suit involves the water rights of the Blue Tent Mining Co. of Nevada county, which were sold, and after the sale McShane, a subsequent oreditor, sought to have the sale set aside, on the ground that it was in opposition to the Act for the protection of stockholders, passed in 1880. The first question raised is, whether under the statute of 1880, making it unlawful for the directors of a mining company to sell mining ground without the consent of the stockholders, it is necessary that the stockholders' consent should be executed, and if, when the deed is shown to have been properly executed, it will be presumed that the stockholders actually consented to the sale. The second question is, whether, after a mining company has sold the property, received the purchase-price, and delivered possession, a subsequent creditor can attack the deed and have it declared void for a lack of ratification—in other words, whether the statute shall be so interpreted as to make all unratified deeds absolutely void, or only to be set aside at the suit of stockholders, no one but a stockholder being able to attack the deed. The further question is raised whether the term mining property includes water rights.

A Discouraging Law.—Considerable dissatisfaction is being expressed by local merchants over a recent order of Secretary Windom, based upon an Act of the last Congress calling for the collection of a tax of ten per cent ad valorem on "all merchandise imported in vessels not of the United States, which are not placed by law or treaty on the footing of vessels of the United States." Collector Phelps enforced the provisions of the new law upon the arrival on Thursday of the Mexican steamer Alejandro. She brought up a valuable cargo of silver ore and bullion, worth about $30,000. Thannhauser & Co., her agents, and other merchants interested, were surprised when notified that the duty must be paid. They consider the law a great discrimination, more especially as it now only affects Mexican vessels. The Alejandro is the only Mexican steamer plying between this and Mexican ports. The Newbern of the Pacific Coast Steamship Co. is her rival.

Reported Discovery of Diamonds in Mexico.—The following is from *El Partido Liberal:*

"It is well known that Gen. D. Vicente Guerrio has discovered, in lands of the State which bears his name, rich beds of diamonds, but we have not found out the exact point where these abundant diamond-beds are situated, as they have never been worked. Only lately, and by the merest chance, this fabulous wealth was found in a sierra named Coronilla, near the village of Tepantitlan, in a district of Guerrero. The bed, as we learn, is situated at the bottom of a barranca, or ravine, in argillaceous land containing an abundance of small stones."

Chrome from Red Bluff.—The firm of N. R. Knight & Co. of San Francisco have contracted with the owners of the chrome mine in Tehama county, to work the same until Jan. 1, 1892. The head of the firm is now making arrangements for active work. A force of men is now getting out several tons of ore daily. It will be hauled four miles to the county road in small wagons, carrying a ton and a half each, thence by heavy teams 25 miles to Red Bluff, where it will be sent to San Francisco and shipped by Cape Horn to the Philadelphia Reduction Works. There is a mountain of ore and the quality is said to be equal to that of the Livermore mines. Employment will be given to a great many miners, men and teams.

The Reno *Gazette* tells of a lumber raft containing 750,000 feet that was towed recently from Bijou, Lake Tahoe, to Glenbrook.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO MINING.—*Ledger*, Aug. 24: The operations of the French Co. on the cement gravel claim continue to pan out very satisfactorily. The Huntington mill crushes about six tons per day, running only during daylight, as the water supply is not sufficient to run all the time. A cleanup is made every night. The cement, which is as hard as quartz when taken out, slackens considerably when exposed to the atmosphere. There are several hundred tons on the dump, and a couple of guards are employed at an expense of $8 per day to watch this dump. From this fact alone the inference to be drawn is that the cement is heavily freighted with the precious metal. Negotiations are in progress for the purchase by Colorado capitalists of the Volcano Gold Gravel Mining Co.'s property, including the big tunnel. It is also rumored that the McLaughlin ditch is being negotiated for by the same parties.

MISCELLANEOUS.—At the Gardner or Paugh mine near Clinton, the tunnel has been driven 150 feet under the present management, with 150 feet more to run before it is expected to strike the ledge. The tunnel is making satisfactory headway. The Alpi Co. has entered into an agreement with San Francisco parties for the sale of the Alpi property. The promoters of the South Eureka mining scheme will shortly make an effort to place stock for the purpose of raising working capital. The mortgage for $10,000 held by Mrs. R. J. Nevills on the interest of W. A. Nevills in the Moore mine and other property, was released last week. We understand a full discharge was made on the payment of $8000. Ex-Governor Blaisdell, who is interested in the Blaisdell riffle belt, visited Amador this week. He called on J. R. Tregloan, superintendent of the South Spring Hill mine. They visited the mine and mill, where one of the Blaisdell belts is working very satisfactorily. This mill is one of the best equipped in the county, having every gold-saving convenience. A new improved Knight's rock-crusher has been lately put in position. The mill and hoisting works are lighted by electricity; the brilliancy of the light, its cheapness, the little danger from fire, should recommend it to all mill-owners. The cheapness of electricity in mills is exemplified here, the water which supplies the power being subsequently used for the batteries. The Talisman mine adjoining is supplied with one light by this dynamo at a cost of 25 cents per month. The machinery of the Keystone is undergoing repairs. The engine is to be thoroughly overhauled, a sufficient quantity of rock being on hand to supply the mill till such time as the engine is again working.

Calaveras.

WATER SUPPLY.—Angels *Echo*, Aug. 24: Owing to the failure of the water supply for mining in this vicinity, some mines have been compelled to shut down, while others have been obliged to reduce their force until the rains set in. Angels will now experience a spell of quiet, in fact dullness, for at least three months to come.

STICKLE.—Owing to the lack of water for mining purposes in this section, operations have been suspended in the Stickle mine in this town. Owing to the same cause quite a large force of the miners have been laid off at the Utica mine.

UTICA.—We are informed that the Utica mill is to be run by steam, and that preparations are making to put in a large engine for that purpose.

MOKELUMNE HILL.—Scarcity of water for mining purposes is the general cry in and around Mokelumne Hill; and in consequence of the drought, times are dull.

THE THORN.—Work is progressing finely in the Thorn mine near San Andreas. The ore prospects well, and the parties now working the mine are hopeful of developing a good paying property.

GRAVEL.—Gravel is being taken from Evans, Lampson & Co.'s mine at Railroad Flat, which yields all the way from 25 cents to $2.50 a pan. Some very coarse pieces of gold have been found. There is a good supply of gravel in sight, insuring the company a good paying property for years to come.

Inyo.

ANVIL SPRINGS.—Cor. Inyo *Index*, Aug. 23: About eight miles northerly over a low divide into a valley, through miles of white sage, Anvil springs are reached. A short distance above, and of easy access, several veins of galena carrying gold and silver have been discovered, one having been sunk to the depth of between 30 and 40 feet, carrying ore the entire distance. Others have been sufficiently uncovered to warrant further exploration, but under present circumstances the ores cannot be profitably handled. Freight from this point to nearest railroad costs $60 per ton; thence to San Francisco, $8; $15 for reduction charges; making a total of $83 per ton.

GOLD HILL.—Leaving Anvil springs, crossing over to the northeastern corner of the valley, thence through some rolling hills, after a 10-mile tramp a new mining camp called Gold Hill is found. The new discovery is situated in Panamint mining district, seven or eight miles southeasterly from the town of Panamint, and on the Death valley slope of the Telescope range. The ores are rich in gold, the veins strong and well defined, and as far as opened have every indication of permanency. Sufficient labor has been performed upon the mines owned by Mr. R. B. Taylor and associates to warrant the erection of reduction works. They are awaiting cooler weather before beginning operations. Messrs. Fletcher & Prentice have some fine ledges which they are developing. As far as opened they not only look encouraging, but promise to become valuable properties. Climbing the eastern slope of the Telescope mountains to the summit, traveling some eight miles northeasterly, passing a large monument of rocks placed to designate the exact center point of Panamint mining district, passing down from the backbone of the mountains from which Death valley, Funeral range, Amargosia and other mountain ranges were viewed to the East, and Panamint valley, Argus range, Sierra Nevada, and Inyo ranges to the west and north, with Telescope peak to the right and Sentinel peak to the left, a trail branches to the west leading down to Surprise canyon, or valley, where nestles the little town of Panamint. Here a 10-stamp mill has been built for treating the ores, which, being of a rebellious character, require roasting. The mill has a 35-ton Stetefeldt furnace and room for 10 additional stamps. A fine engine of 120-horse power and two sets of boilers furnish motive-power and steam for amalgamating purposes. During last winter Mr. J. Curran extracted from the Hemlock mine about 15 tons of ore, which, with three tons of other ore furnished here, produced something over 3400 ounces of bullion, working up to about 95 per cent, the ore averaging over $190 per ton, which is a pretty good showing for this district. In the mine where this ore was obtained there is a large body that will average, as broke from the vein, over 40 ounces in silver. Under existing conditions this was not worked, in consequence of difficulties of obtaining cheaper mill supplies, etc. At present it costs $4 per ton to pack the ore from mine to mill. There are 13 patented mines in Panamint district, all of which are owned by the Surprise M. & M. Co. Many others have been located and opened by private parties, who, knowing their value, are patiently holding their properties. The ledges generally have well-defined smooth walls carrying a plastic clay casing. When the metamorphic and primitive rocks are reached, more uniformity of the ore bodies may be expected. A porphyry dyke trends north and south through the silver belt a short distance north of town. Ledges of greenstone protrude above the surface. Deposits of alum and sulphur crop out. A huge ledge of iron pyrites runs along the northern side of the mountain forming Surprise valley.

Kern.

ASPHALTUM.—Kern Co. *Echo*, Aug. 24: A party of gentlemen from town were riding up the river a few days ago, and when near the head of Kern island canal a dark substance attracted their attention. On making a careful examination they discovered that it was asphaltum of a high grade. An extensive ledge was found to exist there with well defined outcroppings. It is situated on land belonging to J. M. Keith, about three miles from Sumner, and is easily accessible.

Los Angeles.

SAN GABRIEL CANYON.—Cor. Azusa *News*, Aug. 23: The San Gabriel mines are now being worked from the North Fork to the foot of Old Baldy, a distance of some 15 miles, with good average pay, some parties making as high as $20 per day, while others make from $2 to $5. All are making a good living, which is quite an item these hard times. The miner never wants for water to wash dirt with, nor wood to cook his grub. Mountain trout for breakfast all the year around, deer six months, and mountain sheep looking at you from all the surrounding hillsides. A few people come in the canyon and go to work in the mines expecting to get rich in a few days. Such men are apt to get disappointed, as mining requires an honest day's work with the pick and shovel. These mines are the best poor man's in Southern California. Supplies are easily gotten at Azusa, 12 miles distant. Enos Brenna, the old '49er, struck a pocket yesterday, and took out $27 worth of nuggets and a tablespoonful of fine gold.

Monterey.

QUICKSILVER.—Salinas *Democrat*, Aug. 24: W. D. Murray brought out from the Golden West quicksilver mine two flasks of quicksilver, or 150 pounds of pure metal, the most that has been shipped from any one place in Monterey county. A retort has been shipped in by way of San Simeon and erected at the old mine, formerly owned by Murray, but lately purchased by a San Jose company. The Los Burros mining camp is rather quiet at present.

Placer.

BAKER DIVIDE.—Placer *Herald*, Aug. 24: W. Dodge, superintendent of the Baker Divide mine, at Forest Hill, stopped off at Auburn Wednesday while on his way to San Francisco. Mr. Dodge is still running drifts above the tunnel. Upraises have been made at various points in the tunnel from which drifts have been run, but the channel has not been struck. Altogether 5600 feet have been run in these attempts. The main tunnel is 3300 feet in length and is now in hard rock, and the chances are that the channel is ahead and that the tunnel will tap it in a big curve. The big stream of water that was struck in the first upraise near the mouth of the tunnel still flows with undiminished volume. Mr. Dodge says his company will put in hydraulic elevators in their claim on Boston Bar as soon as they can get the water to run them. The river water has been turned into the Boston Bar tunnel and the river-bed has thus been pretty well drained. They are now mining the old-fashioned way, using a Chinese pump to drain the pit.

LIVE OAK.—*Republican*, Aug. 24: Prospecting has been going on quietly at the Live Oak mine near Forest Hill. They have reopened the old William Wear tunnel for a distance of over 300 feet and found gravel the entire length of the tunnel, with the bedrock still pitching. The Wear tunnel was run as early as 1854, but it was abandoned after finding a large amount of water. The water will now be easily overcome in running a drift from the Live Oak lower tunnel. The present appearances of the Live Oak are very favorable, and pan prospects show fine gold from gravel on the high rim. More will be known about this mine as soon as they reach the bottom of the channel, probably within a few days.

MAY FLOWER.—The channel of the May Flower mine at Forest Hill has lately turned considerably to the west and now runs nearly to the southwest. The gold is coarser and is found near the west rim, while heretofore it has been on the east rim. A few days ago the miners found a nugget which weighed over five ounces and worth about $95. The company has made an upraise from the north gangway to the Orono channel which was recently bought from Anthony Clark. Last Saturday night they broke through the bedrock into gravel 22 feet from the bottom of the gangway. The gravel is mostly quartz and prospects well from a few pans that were tried. The purchase of the Orono ground with over a mile of channel increases very much the value of the May Flower consolidated property.

BAKER DIVIDE.—Placer *Republican*, Aug. 23: It may be said of the owners of the Baker Divide mine above Forest Hill that they are good stayers. They are still working away in bedrock, and the following is a description of the work that has been accomplished: A tunnel has been run 3300 feet. At 2200 feet they made an inclined upraise 440 feet, or a vertical distance of 330 feet. Here gravel was struck on pitching bedrock, but there was a large amount of water to contend with, and so another, but vertical, upraise was made at the extreme end of the tunnel. This was pushed up a distance of 125 feet and then a tunnel was run, over what will be the course of the main tunnel when extended, for a distance of 600 feet. Not finding anything there they turned back just half way in this upper tunnel, and at a distance of 300 feet from its beginning they made a 135-foot upraise, from which point they drifted off 150 feet southeast, while the direction of the main tunnel is south, 20 degrees east. At the end of this 150-foot level they raised 30 feet, and then returned to the top of the 125-foot upraise from the main tunnel and extended the 600-foot level back over the main tunnel a distance of 400 feet. At that point they raised 100 feet and then began on a back level toward their first upraise, which has now been run 280 feet. Summing up these levels and upraises, all through bedrock, it will be seen that the total of the work done has been enormous. The best miners with whom the *Republican* is acquainted are all agreed the result will be that the owners will have to extend their main tunnel straight ahead several thousand feet before they can develop their mine.

Plumas.

MINERAL TOWNSHIP.—Greenville *Bulletin*, Aug. 24: Notwithstanding the general complaint of hard times, the characteristic industry of our citizens shows there is a tendency to overcome the great injustice done them by the injunctions; and not being allowed to work their hydraulic mines, nearly all have turned their attention to surface mining while others have sought new vocations. All are waiting anxiously for the report of the debris commission, for as they seemed to express themselves favorably toward our locality we cannot but hope that we may receive some benefit at their hands. All the quartz mines in our vicinity which are placed on the market have been carefully examined by experts during the past week or so, and conditions are very favorable that some will soon change hands. Several of the stockholders of the Shenandoah Quartz M. Co., better known as the Whiting ledge, have visited the mine recently and are very favorably impressed with the indications. If reports are true we will soon hear the sound of stamps reverberating through the "sleepy hollow" of French ravine. Considerable work is being done on the East Branch in the vicinity of Rich bar with very good results.

San Bernardino.

HOLCOMB VALLEY.—Cor. *Miner and Artisan*, Aug. 28: The Valley Gold Co. is doing an enormous amount of work under the superintendency of W. E. Pedly, who has now emp'oyed about 65 men. They have completed 1400 feet of tunnel through solid rock, and have yet 200 feet to complete it ready for work. They are laying two miles of 8, 10 and 16-inch pipe, and building several reservoirs.

CUSSIONBURY.—The Southern California Syndicate Co., limited, composed of English capitalists, has purchased one of the groups of the Black Hawk mines, and have just completed survey of a pipe line from Arctic Springs to Lookout mine, a distance of 6¾ miles. Work will be commenced on a 40-stamp mill immediately after the arrival of Mr. Alexander Del Mar, from London, England, who is expected daily. The Deer Park Mining Co. of Bear valley have struck a large flow of water at a depth of 66 feet, on their placer diggings.

San Diego.

A $50,000 DEAL.—Julian *Sentinel*, Aug. 23: On last Saturday the deal which has been under way for about ten days between King & James, owners of the Owens mining property, and H. A. Williams, a wealthy gentleman of Ohio, was closed, and the papers signed at San Diego. The property covered by this deal comprises three mines—the Owens, Jeannette and San Diego, the purchase price being $50,000. Mr. Williams left for Ohio Sunday, to attend to business connected with this property. Mr. King remains in charge during the absence of Mr. Williams, with authority to push the work. He has let the contract for sinking in the bottom of the old works, William Chambers being the contractor. Work was commenced yesterday, and we hope will not be again interrupted. Reports come from the Pine valley district of more rich mining discoveries. Lots of prospecting going on and mines being opened.

Shasta.

KENNET NOTES.—Cor. *Free Press*, Aug. 23: The Clipper mine is, to our sorrow, at a little standstill again, but we learn that arrangements are being made to give another and longer bond on said property. The Uncle Sam mine is doing lots of work, tramways are being erected, ditches for water-power are being dug, and all around the mine improvements are being pushed with vigor. Capt. Wm. James of the S. B. mine arrived here a few days since to look after the interests of the camp. S. J. Johns, Esq., manager, and Mr. Hopper, secretary of the Uncle Sam mine, are doing lots of work to bring all in mining order as quick as brains and money can accomplish it. The Snyder Mining Co., James Baron, superintendent, is starting up its mill, and we are waiting good results. The Butters Ore Milling Works is receiving shipments of sulphurets daily from the Uncle Sam mine, and no doubt they will be worked with fine results.

Sierra.

A RICH POCKET MINE.—Nevada *Transcript*, Aug. 24: Apple & Grant, the young millwrights from San Francisco, who last winter took out $12,000 from their little quartz claim just this side of Kanaka creek between Alleghany and Chips flat, working there by themselves and doing their crushing with a hand mortar, have found more rich ore. They first struck pay in the old tunnel run years ago by a Sacramento company that abandoned it in disgust after spending much money without getting any back. They have since run another tunnel 75 feet lower and this also shows pay. Mr. Apple is at present in charge of the operations, Mr. Grant being in Alaska superintending the construction of a large quartz-mill. The property is situated in the same belt as the Oriental, Docile, Plumbago, Fessler's and other claims, some of which have yielded phenomenal returns at intervals.

THE RED CHIEF MINE.—Nevada *Transcript*, Aug. 23: Levi Kendricks of this city and J. H. Seek of San Francisco have returned from the Red Chief mine on Kanaka creek, Sierra county, where they have been testing the ore with a Huntington crusher. They obtained good results. The ore they put through was of medium grade, milling about $5 a ton. The ledge is 250 feet wide, and the Red Chief Co. has locations on it aggregating 6000 feet in length. The new 40-stamp mill will be completed soon. A portion of the stamps will be started next week, and it is the intention as soon as the winter storms come and increase the water supply to have the mill in full operation.

SUNFLOWER.—*Mountain Messenger*, Aug. 24: The Sunflower Co. of Pike City is clearing ground at the tunnel mouth, preparatory to putting up a mill. It is to be a Huntington, we believe. The latest report is that some very good rock has been developed. J. B. York and Phil Lantz found a piece of quartz in their diggings in Slug Canyon last Saturday, valued at about $100.

Siskiyou.

QUARTZ.—Yreka *Journal*, Aug. 28: Messrs. Radelfinger & Dannenbrink, owners of the Gold Run mine at Know Nothing creek, have built a new ditch to secure more water-power for running their quartz-mill, which is about completed. They have been offered a big price for their mine by an English company of capitalists, but it is doubtful whether a sale may be effected, as they have a large body of exceedingly rich quartz in sight, to insure permanency. An English company, owning a ledge on Methodist creek, another tributary of the Salmon, not far from Know Nothing creek, intends making preparations to develop it on an extensive scale, by putting up a large mill and employing a number of experienced quartz miners. The Warren quartz-mill on Yreka Flats will be started up again soon to crush quartz taken out at the Witherhill ledge on head of Spring gulch, near summit of Humbug range. It is a bad place to haul from, with no water in vicinity for animals, but as the weather is becoming cooler, the hauling will not be so severe on teams.

RIVER MINERS.—The river miners on the Klamath are commencing to hoist pay gravel again, their wingdams and machinery having been repaired and rebuilt since the terrific cloudburst of July 24th, which caused such great damage all along the river from Cottonwood creek all the way down to Happy Camp.

Tuolumne.

THE PRICE RECEIVED.—Tuolumne *Independent*, Aug. 24: We are informed that the price received by Mr. Hyde for his property was $30,000. The mine sold for $25,000 and the ranch for $5000.

SETTLED.—The suit involving the Lady Washington mine vs. Hayward & Hobert has been settled. Mrs. Dorsey now has a perfect and undisputed title to the above-named mine.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—Virginia *Chronicle*, Aug. 24: The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. On the 1600 level continue to extract ore from ground bordering the south drift from the Ophir line on the sill floor. On the 1650 level: The stopes on the seventh and eleventh floors above this level continue to yield the usual quantity of ore of fair quality. During the week 1028 tons and 1540 pounds of ore were shipped to the Morgan mill; 1791 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $31.10. Shipped during the week bullion valued at $44,768.40 to the Carson mint. Now on hand in the assay office about $21,000.

OCCIDENTAL CON.—On the 300 level a north drift is advanced 56 feet from the upraise, 90 feet on the slope above this level showing value. Extracting ore from the 350, 400 and 450 levels. During the week extracted and milled 348 tons of ore showing an average assay value of $17 per ton. Shipped to Carson mint bullion valued at $5974, and have sulphurets on hand valued at $8000.

BEST & BELCHER.—On the 550 level the northwest drift is extended 56 feet; formation, porphyry, with streaks of quartz. On the 1000 level the northwest drift is extended 191 feet; formation, porphyry and quartz showing some value.

GOULD & CURRY.—On the 300 level the west drift from crosscut No. 2 is extended 53 feet; formation, soft porphyry. On the 400 level west crosscut No. 1 is extended 250 feet; formation, hard porphyry.

BELCHER.—The 200 level west crosscut is in 113 feet, the face in porphyry. Have resumed work in the 1200 level south drift. The raise above the 1200 level is in quartz assaying from $4 to $8 per ton.

JUSTICE.—The mill crushed 201 tons of ore during the week, showing a value of $18.52 per ton by battery sample assays. The top of the raise above the 490 level has entered fair-grade ore.

CROWN POINT.—The 700 level south drift is in low-grade quartz. The 800 level south drift is out 43 feet and the west crosscut 87 feet, the latter in porphyry and quartz.

UNION CON.—On the 1465 level west crosscut No. 2 from the north lateral drift is advanced 304 feet, passing through a formation of porphyry and clay.

HALE & NORCROSS.—Repairs in progress on the various levels. On the 500 level have put in square timber sets up to the Savage line, where good ore is showing.

ALTA.—Stopes on the 825 and 925 levels yielding the usual quantity and grade of ore. Crushing and concentrating the usual amount and grade of ore.

NORTH OCCIDENTAL.—On the 400 level the north drift is advanced 211 feet. The face continues in porphyry and very hard quartz carrying value.

SIERRA NEVADA.—On the 520 level from the shaft station, an east drift is advanced 1152 feet, continuing in hard porphyry with some water.

ANDES.—Drifting west in quartz and porphyry from the raise above the 350 level and from the bottom of the winze below the 350 level.

OVERMAN.—North drift from the winze and top of upraise continues in quartz. The Caledonia south drift continues in vein material.

ALPHA.—The 500 level west crosscut is in 217 feet, the face in porphyry and quartz. The 382 level west crosscut is in quartz and clay.

CHOLLAR.—The 750 level north drift continues in porphyry. The 650 level west crosscut passed through five feet of low-grade quartz.

POTOSI.—The 750 level south drift has stripped 50 feet of solid quartz giving low assays. Nothing new in explorations at other points.

OPHIR.—On the 1465 level the raise above the east drift from the shaft station is up 165 feet, and continues in a quartz and porphyry formation.

From the 1300 level shaft station an east crosscut will be advanced 300 feet to connect with the top of this upraise.

CONFIDENCE AND CHALLENGE.—The 500 level joint Imperial west crosscut is in 42 feet. The face continues in quartz and porphyry.

MEXICAN.—On the 1465 level the north drift from west crosscut No. 1 is advanced 261 feet, continuing in porphyry and quartz.

SAVAGE.—A north drift from the west drift has stripped 19 feet of fair grade ore. Nothing new in explorations at other points.

IMPERIAL.—The 300 level north drift is out 389 feet from the south line. The face continues in porphyry and quartz.

UTAH.—On the 600 level, the north drift is advanced 485 feet; formation, porphyry and quartz, showing value.

SILVER HILL.—The 160 and 260 level northwest drifts are out respectively 595 and 480 feet.

SEG. BELCHER.—The 1100 level south drift from the Belcher raise is showing bunches of ore.

BULLION.—Explorations on the 760 level are not yet resumed through the Chollar shaft.

NEW YORK CON.—The upraise above the 800 level continues in fair-grade ore.

EXCHEQUER.—The 382 and 500 level west crosscuts continue in porphyry.

YELLOW JACKET.—Continue shipping 50 tons of ore daily.

WARD SHAFT.—Reopening shaft below the 1500 level.

BENTON.—Operations temporarily suspended.

Morey District.

MILL STOPPED.—Belmont *Courier*, Aug. 24: Henry Metz informs us that the mill at Morey has crushed all of the low-grade ore. Mr. Cohen has shut down the mill temporarily. Messrs. Moore & Schendell, the lessees, are making money rapidly. All the stopes show rich ore in large quantities, and the outlook for Morey was never better. The high grade ore will be shipped to Salt Lake for reduction.

Pioche District.

HALF MOON.—Pioche *Record*, Aug. 24: At this mine during the past three months development work has been going on which has put the mine in good shape to produce ore when the smelter begins operations. Several hundred feet of new drifts have been run, all opening up ore in large quantities, except one prospect drift, and it is estimated that the mine is in condition now to yield 25 tons of ore a day for ten months at least. The ore is low grade and requires careful working, but it is easily mined and will pay handsomely. This property, but little thought of only a short time ago, will prove one of the mainstays of the Yuba M. & R. Co. which owns it.

Red Canyon District.

ORE STRIKE.—Virginia *Chronicle*, Aug. 23: Geo. A. Fitzmier returned yesterday from a visit to Red Canyon mining district, Douglas county, where he went to inspect a recent development in the Red Cloud location, which he has been engaged in prospecting for several years and has been finally rewarded by the development of a vein of ore three feet in width, which shows an average assay value across the face of $100 per ton. The vein was cut at a depth of 60 feet below the surface by driving an adit tunnel 140 feet in length. There is a five-stamp mill, operated by steam, about 1½ miles from the mine, where the ore extracted will be crushed. There are only a few men employed in the district. Several owners of mining locations in Red Canyon are also ranchers, and are now about gathering their crops, from the sale of which they will acquire more capital to develop their mining property, expecting eventually to realize a heavy interest on the investment.

Tuscarora District.

COMMONWEALTH. — *Times Review*, Aug. 23: Work of retimbering the shaft is progressing very well. The north drift, 100-foot level, extended six feet, continues to show good ore in the face. The mill will be cleaned up in two days more. Commonwealth concentrates from Grand Prize plant have been worked and give returns of 95½ per cent. Bullion shipments during the week, $21,527.44. Crude bullion on hand, about $10,000.

NAVAJO.—The crosscut from the end of the south drift east, 300-foot level, extended 13 feet. Upraise south end, same level, extended 11 feet and continues in high-grade ore.

BELLE ISLE.—The drift north from the end of the west crosscut, 250-foot level, has been extended 16 feet. The face of the drift looks favorable.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 18 feet. The rock is much harder in the bottom. The flow of water has doubled in the past 24 hours. Everything running smoothly.

NORTH COMMONWEALTH. — Joint crosscut, 225-foot level, extended 13 feet all in vein matter and low-grade ore. East crosscut No. 1, 100-foot level, has reached the hanging-wall. The main south drift has been advanced 10 feet, showing some high-grade ore.

DEL MONTE.—North drift, 225-foot level, extended 14 feet; the face looks favorable for ore. Joint crosscut, 225-foot level, extended 13 feet, all in vein matter and low-grade ore. No. 1 crosscut east, 100-foot level, extended 14 feet, still showing ore in the face.

GRAND PRIZE.—400-foot level: West drift, old vein, has been extended 13 feet. Face of west drift from north crosscut advanced 14 feet, and west crosscut from south drift extended 10 feet. Water is now down 20 feet below the 400-foot level, and good headway is being made in lowering it. The concentrator will be started up on Grand Prize ore next week.

ARIZONA.

SENDING IN ORE.—Prescott *Courier*, Aug. 24: Johns & Ronald, lessees of the Catoctin mine, are sending in ore which goes to Colorado for treatment. The lessees of Dan Hatz's Emerald mine, in Slate Creek district, have shipped ore that worked $150 and $200 per ton in gold. The vein that produces this rich ore is small. Water is troubling the Howard people. They are milling second-class gold ore. W. W. Vanderbilt has men employed opening ledges in good shape. The Boggs and Hackberry mines in Lower Big Bug are being developed in the right way. Rumor has it that T. W. Boggs has disposed of his interest to Mr. Murray, and that Mr. Williams will manage the properties. We have written too much about mines here to go back on what we have said of them, and will close by asserting that the man who professes to believe that the United Verde, the Cherry Creek, Agua Fria, the Etta group, the Big Bug, Tip Top, Walker, Hassayampa, Bradshaw, Peck, Groom Creek, Congress, Eureka and other districts cannot, right now, furnish ore for small reduction works, is deceiving himself or trying to deceive people here who have lived for years off the proceeds of ore from said mines.

MOHAVE NOTES.—*Miner*, Aug. 24: A. E. Rogers had a lot of ore from the Tintic run through the sampling works this week. Dr. W. N. Sherman has commenced development work on the Alma claim, near Mineral Park. John Popham and John Hudgeons are taking out some high-grade ore from a claim on the south side of Surrum's Peak. D. R. Bell will soon commence the leaching of the dump at the Signal mine. Mr. Bell says that the ore leaches readily, and he thinks it will pay. The C. O. D. mine is looking better than ever, and it is expected that the month's work will be a shipment of about 100 tons of high-grade ore. Supt. Bowers has stopped the sinking of the shaft in the Night Hawk on account of the water, and the work of stoping out the new shoots has been commenced. The Empire mine is taking out some very fine ore. Specimens sent in by E. F. Thompson show the rock full of native and wire silver. The richest ore assays something over 1200 ounces per ton. Robt. Patterson was in from Gold Basin this week. The mines in that locality are looking well. The O. K. Mining Co. will commence operations again as soon as the cool weather sets in. Prospecting for water will be continued. Col. R. E. Beattie and J. M. Dawley are looking over the mines in Chloride district.

GRAND PRIZE.—Globe *Silver Belt*, Aug. 23: The Grand Prize mine, formerly owned by Messrs. Gray, Richards and Watts, situated about 15 miles north of Payson, on Webber creek, Gila county, is now in the possession of a Chicago company, with Capt. Burbridge as superintendent and Frank Bissig foreman. They are working 20 men and erecting serviceable hoisting works, a good pump, a cannon-ball mill of 10 tons capacity per day and two concentrating tables. In the bottom of the shaft at a depth of 110 feet is said to be a vein 18 inches to 2 feet wide of high-grade gold rock. The agreement entered into between the company and former owners is that the company erect the mill, hoisting works, pump, etc., and work the mine for three months after the machinery is in place, and should they realize during that time a sufficient sum to pay for the machinery, they are then to pay Messrs. Gray, Richards and Watts $50,000 for the mine. In case the three months' operations do not prove profitable the company has the privilege of giving up the mine.

BRITISH COLUMBIA.

LILLOOET.—Kamloops *Sentinel*, Aug. 23: Jas. Nevins of St. Mary's creek has just commenced sluicing and in a few days will clean up. He has six men employed. There is a large gang of Chinese opposite Chimney creek who have built an extensive ditch costing them several thousand dollars. Their claim it is said pays from $3 to $4 per man.

COLORADO.

OPHIR'S ORE.—Silverton *Miner*, Aug. 23: Mr. Crim of Salt Lake City, one of the owners of the Grand View, has been in town for the past two weeks. Mr. Goddard of East Saginaw, also part owner, is expected here in a few days. This property has not been worked for several years, owing to a misunderstanding between the owners. The Silver Bell is working a force of 12 men and taking out high-grade ore. Tom Simons is packing the ore to the Burro Bridge, where it is loaded on the cars and sold to Duyckinck & Co. Olaf Nelson has taken a lease on the Terrible. This is the western extension of the Silver Bell, and is owned by K. Benson of Silverton. The Nevada is being worked by Mason & Douglas, who have a lease on the property and are working a force of 16 men. They are jigging the ore from the old workings of the mine. The Suffolk is shipping every day, and keeps five stamps going night and day. Holly & Smith have taken a lease on the Hidden Treasure. This is gold property, and a mill-run of ten tons will be made in a few days. Major McBernie is working a number of men on the Triangle. It is located near the Suffolk, and rich ore is being taken out. Robert Neely is foreman. Bob is an old-timer in Ophir, and is familiar with all the ore in the camp. No good ore is thrown away where Bob has charge. The Clara at Trout lake is shipping to Duyckinck & Co. They are working a large force of men. Mr. Rose of St. Louis is superintendent of the property, and James Herring is foreman. Jim is an old-timer in the San Juan. The San Bernardo, also near the Trout lake, is being worked by Messrs. Beattie, Mason & Douglas, who have a lease and bond on the property. Mr. Beattie is sheriff of San Miguel county.

MILLING FACILITIES. — Georgetown *Courier*, Aug. 24: Georgetown's milling facilities deserve renewed interest. The present mills possess a fortune in the way of water-rights, water-powers and franchises. Most of them are of an antiquated type of machinery, but the franchises are such as to make them very valuable. With the mines at Empire coming to the front, the strikes on Lincoln mountain and the older mines seeking a market for their concentrating ores, the mills should engage the attention of capitalists. The concentrators in operation show what can be done, although working under great disadvantage. If the capacity was increased, new machinery put in, milling interest would at once revive and build up the town, for with mills comes necessity for machinery and general supplies, for wage labor and that general diversity of industry without which no community can prosper.

DAKOTA.

MONITOR.—Deadwood *Pioneer*, Aug. 23: A gold brick, valued at about $3000, representing a partial cleanup at the Monitor for the first 20 days of August, was brought down yesterday. Final cleanup for the month will be made September 1st. Directors have held no meeting lately and it is not probable will get together before the first week in next month, when it is hoped and anticipated another dividend will be declared.

PYRITIC SMELTING.—Seth Bullock came in from Carbonate yesterday evening, and in conversation with a *Pioneer* reporter confirmed statement published elsewhere, that the Iron Hill smelter having turned out four carloads of bullion, was to shut down at 12 last night. Furnaces will be changed at once and the plant blown in again two weeks, which will be for a practical test of dry or pyritic smelting. That it can be successfully applied is beyond question, since the process has been in use in Germany for more than three centuries. At Portland, Maine, it is operated on ore at a cost of $1.50 per ton. That it is the best method yet hit upon for treatment of Black Hills refractory ores, since it saves the full assay value of both gold and silver, is everywhere acknowledged. Once practically demonstrated, as it will be at the Iron Hill, the prediction is ventured that a large plant will go up in Deadwood.

IDAHO.

ATLANTA.—Ketchum *Keystone*, Aug. 24: G. G. Adams, of Atlanta, came in from that camp Tuesday. Mr. Adams says that Atlanta bids fair to assume its old-time prominence as an ore-producing camp, for at no period since its discovery—a quarter of a century ago—has a more hopeful feeling prevailed. Mr. C. N. Miller, with his concentrating mill, has fully demonstrated that the low-grade ores of the camp can be treated at a good profit, which has led the Buffalo company and others to erect a new plant and adopt the same methods. The Tahoma company have a ten-stamp mill and four Frue vanners handling in the neighborhood of twenty tons of pulp each day. Mr. Rudolph Behren, the manager of the Buffalo company, is exerting himself to the utmost to get ready to crush ore as soon as possible. Aside from the corporations, there are many properties owned by individuals, among which may be mentioned the claim of Messrs. Gaetz & Walters, upon which they are erecting a five-stamp mill; those of Messrs. Biers & Motton, Judge Heath's and Mr. Geo. Tims, all more or less developed, and improving with each day's work. The ores of the district carry ruby, native silver and sulphurets, with gold in a free and sulphuret state, all admitting of being concentrated except the ruby. Work has been suspended for the present upon the Silver King mine at Sawtooth. All the miners but two have been discharged. Those two have been left in charge of the mine.

WAGONTOWN DISTRICT.—Cor. *Statesman*, Aug. 25: The De La Mar mill is finished and can be run by steam; and ore hauling has begun and the reduction of ore, sufficient to pay expenses, for the thorough development of the splendid mine will begin in a few days. Six men have been put on in addition to the regular prospecting force, and the stoping of ore is progressing briskly. Ludwig, who represents a wealthy Pittsburg syndicate, is driving a tunnel on the Stoddard mine, east of the Wilson mine. No big ore body has yet been encountered, but the lode holds its own and looks well. Sommercamp is the owner of a fine group of claims adjoining the Wilson group, and though he has spent a fortune in the development of his claims, he intends to work a force of half a dozen men this fall and winter, to still further develop them. Negotiations are pending for the purchase of some fine mining property in Florida mountain, owned by Knott.

LOWER CALIFORNIA.

PLACER MINING AGAIN.—*San Diegan*, Aug. 20: W. H. Smith, the oldest white settler at Ensenada, came up this morning on the steamer Dublan. He says the recent rains at the Alamo made digging easy and caused quite a general return to the placer mining. Scores of small nuggets were discovered and quite a number of good ones were picked up. This work, however, was only taken up by the camp followers. The mining companies are busily engaged in preparing for handling quartz. The El Paso Co. are putting up a ten-stamp mill which will be the best in the country. Twenty-five men are employed now setting up the machinery. At the Alamo three inches of rain fell in two hours.

MONTANA.

AT THE BLUE BIRD.—*Inter-Mountain*, Aug. 21: Work of getting ready to start a leaching plant at the Blue Bird is still progressing. The two buildings being put up to accommodate the new process are 116x52, and 25x25 feet in dimensions. The buildings are about completed. Progress just at present has been delayed by the non-arrival of the Oregon pine lumber which is to be used in the construction of the tanks. It is thought that it will be a month before everything is in readiness to start the leaching process. At the mine and mill everything is running as usual. The crosscut at the 600-foot level is still being driven to cut the vein, which is yet quite a distance away.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, Aug. 23: The output for the week ending Aug. 22 was 57 bars of bullion, containing 80,500 ounces fine silver and 186 ounces fine gold.

COMBINATION CO.—Ten additional stamps are to be put in; also some roasters, which will enable them to work all the ore, instead of shipping it to Butte after concentrating, as they have always done. One hundred thousand brick for the new addition is being conveyed from Phillipsburg to Black Pine. A meeting of the trustees of the company was held in Butte last Monday evening, and when, after a thorough investigation, the recommendation of Supt. Akers was adopted, it was decided to put in a Brueckner furnace. It is claimed that this addition will save the company at least $1000 a month in transportation, working charges, etc., and the cost will not be over $6000.

LITTLE BLACKFOOT DISTRICT.—Judging from all reports from the Little Blackfoot district, it will soon be recognized as one of the first in the Territory. Ever since Angus A. McDonald, of Phillipsburg, and some other gentlemen purchased the Telegraph mine at that place last spring, other parties have gone into the camp and made investments, until now a great deal of work has been done. A mining man in from there this week says it is the most favorable outlook for a rich camp that he has ever seen.

THE LEADVILLE DISTRICT.—*New Northwest*, Aug. 23: A recent assay from T. J. Kelley's lead of hard carbonates in the new Leadville district, 12 miles southeast of Deer Lodge, shows 85 ounces of silver and 32 per cent lead. Other claims assay 26 ounces silver and 32 per cent lead, 46 ounces silver and 34 per cent lead, and 26¾ ounces silver and 32 per cent lead, etc. Constant accessions are being made to the population of the new camp and everything that shows up yellow is staked off into claims. Those who got in on the ground floor are confident they will some day have a camp equal to the original Leadville. Not enough work has yet been done, however, to fix the status of the district, though the showing is certainly good for the little development that has been made.

NEW MEXICO.

LEASING.—Silver City *Enterprise*, Aug. 24: Wm. Beall and Dan Casey, who are leasing on Solid Silver ground at Black Hawk, are taking out some good ore. They now have about three tons sacked, a part of which is worth $500 per ton. The new Humboldt mill at Lordsburg has started up and is running steadily. Milt Miller and James Dodd returned Tuesday from Socorro, where they went with a shipment of ore from the Alhambra mine. The shipment was an astonisher to the Rio Grande Smelting Co., all those connected with the plant declaring they had never before seen or handled such a lot of rich ore. It was so rich, in fact, that at one time the smelter people declined to purchase it, and the ore was sacked up for shipment to Denver, but later changed their mind and proceeded with the sampling, which was no easy job, as all of the ore averaged over $1 per pound, and the first grade, of which there was 1000 pounds, ran high into the thousands. It was decidedly the richest shipment of ore ever made from Grant county. After returning home the boys purchased C. G. Miller's interest in the mine for $5000 spot cash, after giving him his interest in the shipment.

CARLISLE.—The *Enterprise* is informed by a Carlisle gentleman that a strike of importance has been made in the Carlisle mine. The informant states that every assurance is favorable in regard to the Carlisle being a bonanza for years to come. He thinks it is decidedly the biggest mining camp in the Southwest. What was originally taken for the footwall has turned out to be only a "horse" or slab of porphyry. A cut has been run through the porphyry and into the new ore body for a distance of 15 feet without a break. The ore is said to be richer than that heretofore taken from the mine. Good ore has also been encountered at the 60-foot level, and at the 600-foot level the ore is of a much better grade than at the 500-foot level. Galena is coming in more as depth is obtained, the concentrates now running over 30 per cent lead, and it is thought that the concentrates can now be smelted at the mine, thus saving a large amount of money paid out for transportation. Four or five men employed in the new body of ore will be able to keep the 60 stamps running.

OREGON.

CORNUCOPIA.—Cor. Baker City *Democrat*, Aug. 24: The mining outlook for the camp was never more promising than at the present time. The hundreds of locations are being worked by their owners as far as the money will go, but in most instances it is very limited, and consequently many locations receive no attention further than assessment work. The ore of the camp is all about the same character and is of that class which requires a great deal of machinery to properly reduce it. Considerable of the ore carries free gold, but the major portion of the value is in sulphurets. There are several mines that have been worked constantly ever since the camp was first discovered, about five years ago, and they are no longer classed as prospects but are called mines and are entitled to the appellation in every sense of the word. Among them we might name the Red Jacket, Simmons Group, Last Chance, Companion, Union, Forest Queen, May Flower, Red Boy, Moonshine, May Queen, Wild Irishman, Estella, Comet, Monte Cristo, and others. These mines have undergone extensive development and are showing up well. There are many other locations that are just as promising but have not been sufficiently developed to prove their intrinsic value. It is surprising, with all the mineral in sight in this camp, that at the present time there is but one mill in operation and that a 20-stamp. There is plenty of ore on the dumps to keep 20 mills of the like capacity running for months. What is most needed is a large custom mill with all the necessary machinery for working the concentrates. There is plenty of water, and if Pine creek was properly utilized it would furnish power for mills of any magnitude. It is only a matter of time until the Oregon Gold M. Co. will be running their mill by water-power.

UTAH.

IMPROVEMENT.—Park *Record*, Aug. 24: It is indeed gratifying to learn of the continued improvement of the Comstock ledge. Only last Thursday another strike was made in the face of the tunnel where a second pay chute appeared. It is about 18 inches in width and is increasing; meanwhile the vein of galena and carbonates is holding its own. The character of this second pay chute is principally high-grade free-milling, and some of the fine streaks and bromides will assay way into the thousands in silver. The tunnel is following the big ledge on a nearly straight line and less water is encountered now in the face. The Comstock has abundant promises in store for the London stockholders, and also for the entire country west of Thanes canyon to Scott Hill.

AN IRON CANYON STRIKE.—A few days ago Thos. Roscamp and John Glenn made an important discovery by chance in the Golden Staff claim situated toward the head of Iron canyon, the Himalaya group being between this property and the summit of Scott Hill. They have the croppings of a fine ledge and the shaft being sunk on it gives encouragement of a future mine. The ledge contains a small seam of ore which will go well in silver and lead, with traces of gold.

ORE AND BULLION SHIPMENTS.—During the week the Ontario shipped 30 bars of bullion, containing 16,267.69 fine ounces of silver. For the week just ended the Mackintosh sampler received 589,080 pounds of Ontario ore; 368,360 of Daly; 135,160 of Mayflower No. 7 leasers'; 86,290 of Woodside concentrates from the Union concentrator; 44,390 of Woodside first-class ore; 33,030 of Woodside jiggings; and 10 000 pounds of Jupiter leasers' ore; total, 1,266,310 pounds.

MECHANICAL PROGRESS.

American-Made Files.

The history of the growth of the American industry of file manufacture is both interesting and instructive as showing what can be done in building up an industry and cheapening its products by a little well-timed "protection." Mr. Wm. H. Maher of the Toledo *Blade* tells in an interesting fashion how the mechanics' file has contributed to prove the universality of this law, as follows:

"There is scarcely any one tool," says Mr. Maher, "that is so generally met with as a file. The crippled wood-sawyer who comes to cut your wood depends upon his file to keep his poor old saw in order. It is found in the chest of the carpenter; it is the right hand of the machinist. The little stave factory in the woods and the magnificent locomotive works alike depend upon a file to do their work and keep their tools in order. The village blacksmith could do nothing without his rasp, and a cabinet-maker depends on his file as an engine depends on steam.

"So universally is the tool used, and so constantly are mechanics and manufacturers purchasing, that the prices are well known, and a brief glance at the history of American files may be of interest. I have been connected with the file trade for nearly 23 years, simply as a middleman, buying such goods as would sell easiest and were most in demand. I made a bill to-day of a certain size of cross-cut files at $1.44 per dozen. I then turned back to the sales-book of 1866, and discovered that the price charged then for the same size was $6.50 per dozen. This is a decline in the price calculated to make one's eyes open.

"In 1866 almost every file in stock and in use was of English manufacture. All files at that date were cut by hand. Machines for cutting had been patented and an immense factory built at Boston to manufacture by machinery, but the goods proved worthless, failure overtook the concern, and for several years the country was flooded with the bankrupt stock that was given away with difficulty. There was a heavy duty on files, for it was desirable that they should be made here, and small factories were springing up all over the land where hand-cut files were made.

"Notwithstanding the Boston failure, American mechanics were not content to give up the cutting of files by machinery, and between 1866 and 1870 factories were established at Providence, R. I., Middletown, N. Y., Beaver Falls and Philadelphia, Pa. These makers put their goods on the market on their merits, cutting under the English price, and warranting their work.

"A few years ago a file factory was started in Saginaw, Mich. The file trade of Northern Michigan, because of the immense sawing done, is very large. The home file was offered to Michigan men at the same price as the Eastern file. The disposition on the part of consumers was to give the home file the preference, and the Eastern makers saw their orders decrease. They did not propose to permit this, so they cut the price, in hopes of driving the new concern out of the field. The result of this cut was an immediate saving of about $500 per day to consumers of files, and the cutting has been going on from that day to this. So, then, in about 20 years, under our tariff laws, we have seen files reduced in cost from $6.50 per dozen to $1.44."

HOW SWORD-BLADES ARE MADE.—Sword-blades should be, and usually are, made and tempered so that they will chip a piece out of a stone without showing a nick upon their edges. This information is given by one who has been through the great sword manufactory at Solingen, Germany. He writes to a Pittsburg paper a long description of the methods used there. The steel, he says, is cut from bars into strips about 2½ inches wide, and of the required length, by a heavy cutting machine. These are carried into the adjoining forge-room, where each piece is heated white, hammered by steam so that about 20 blows fall upon every part of its surface, and then thrown into a barrel of water. Afterward these pieces are again heated in a great coke fire, and each goes through a set of rolls, which reduce it to something like the desired shape of the weapon. The rough margins are trimmed off the piece of steel in another machine, and there is left a piece of dirty, dark-blue metal shaped like a sword and ready for grinding. This is done on great stones, revolved and watered by machinery, the workmen having to be the most expert that can be obtained, as the whole fate of the sword is in their hands. It is afterward burnished on small wheels managed by boys from 12 to 16 years old, and when it has been prepared to receive the fittings of the handles, is ready for testing, which has to be done with great care. Any fault in the work is charged to the workman responsible for it, and he has to make it good. It is said that any blade which will not chip a piece out of a stone without showing a nick on itself is rejected.

FLEXIBLE METALLIC TUBING.—Considerable interest was shown at the Brussels Exposition in 1888 in a form of flexible metallic tubing exhibited by the Belgian and Colonial Flexible Metallic Tubing Co. of Brussels, Belgium. The tubing was formed by wrapping strips of metal spirally around a mandrel. The metal strips were bent over at both sides and a thin, narrow rubber band was inserted to prevent leakage. The tubes could be bent in any direction, were perfectly tight, and were claimed to possess great resistance to both internal and external pressures, and to be easily handled and repaired. They were designed to compete with rubber hose in its various applications, and, according to present accounts, have met with a fair share of popularity. The tubing shown at Brussels was of brass and a wide variety of sizes.

A NEW MACHINE FOR HORSESHOE NAILS has recently been invented by an Englishman which is referred to by an English paper as follows: 'A demonstration of the powers of a new machine for the production of horseshoe nails was given in London recently on behalf of Mr. Capewell, the inventor. Each machine will produce over 600 pounds of average-sized nails in the working day of ten hours, and one boy can fully attend to four machines. The nails themselves are produced direct from the cold steel bar, and are therefore even in temper throughout and uniform, while it is claimed for them that in their finish, tensile strength, holding power in chuck, and freedom from liability to fracture under the heads, they are without rival in the market. Their cost is but little over half that of nails made by other processes. The process itself is very simple. The end of a coil of steel bar or wire on a drum is put into the machine, which, automatically cutting pieces of the required length, passes them down through a series of dies, which draw and bevel them; they are then caught in slots in a revolving plate and pointed, headed and finally dropped—finished nails ready for use—without any hand labor whatever. Should any failure take place in any of these operations with any nail blank, the fault instantly throws the machine out of gear, while a danger signal marks the exact spot where it occurs. To remove the faulty blank and restart the machine is the matter of seconds only.

CHROMIUM STEEL.—A new metallurgical industry has recently been started by a well-known firm of chemical manufacturers. It is the extraction of the metal chromium from its ores, to be subsequently used in making steel for very special purposes, locally by the Steel Company of Scotland, and at Sheffield in making armor plates at the Atlas Works of Sir John Brown & Co. The chromium is found to impart to open-hearth and crucible steel a wonderful amount of tensile strength, and consequently chrome steel is likely to be of the very greatest service in the armor-plate industry.—*Iron and Coal Trades Review.*

TUBULAR STEEL SLEDS.—And still another use has been discovered for steel tubes. They will be manufactured into sleds. Small sleds for coasting, large sleds for heavy hauling and even sleighs can be thus manufactured, proving light, convenient and substantial. This will create still greater demand for small-sized pipe. It is said that a company has been chartered for the construction of tubular sleds, and that the material will be supplied by the National Tube Works at McKeesport, Pa.

A GREAT STEEL PLANT.—The steel plant of the Phœnix Iron Company of Philadelphia, which has been in course of erection for the last four months, is now reported as completed. The engines weigh 370,000 pounds, and the roll train weighs 400,000 pounds. This is the largest plant in the country, not excepting that at Pottsville. The plant is expected to turn out steel suitable for armoring cruisers for the Government and for making steel guns of any caliber.

ROADWAY ON IRON BRIDGES.—Sir A. Rendel, the Consulting Engineer of the Home Government of India, has recently recommended, on the ground of strength and economy, the covering of the main girders transversely with corrugated iron plates, which, he says, form (when ballasted) a much better and more durable roadway for traffic, and probably a cheaper one than planking, and at the same time contribute to the structural strength of the bridge.

A STEEL CHURCH.—A church made of cast Bessemer steel has just been constructed by an iron works at Hennegau in Germany. Its destination is the island of Manilla, where frequent earthquakes render a brick building unsafe. The weight of this steel church is 1600 tons, and it will, it is thought, from calculations made, be capable of resisting earthquakes of a very severe nature.

COMPARATIVE VALUE OF MANUFACTURED STEEL.—Some interesting and curious figures were given in a speech by Sir Daniel Adamson, before the Iron and Steel Institute, regarding the comparative value of a ton of manufactured steel. The value of a ton of steel in the shape of steel rails is, say, $22, but the wholesale price of a ton of steel hair springs for watches would be $200,000,000.

A SELF COUNTER SINKING SCREW is a novelty. It is simply fitted with cutting teeth on the under side or bevel of the head, which cut into the wood as the screw is driven home, thus enabling the head to counter-sink itself. The channels and the teeth are both wider as they near the top of the head, thereby allowing the sawdust to escape.

SCIENTIFIC PROGRESS.

Improvements in Sugar Manufacture.

If the accounts of inventions and improvements in sugar manufacture, which we are receiving from Germany, are reliable, there is much reason for believing that we are just upon the eve of a complete revolution in this great industry all over the world. A Philadelphia paper of late date has the following:

The first lignite sugar refinery in this country is about to be put into operation, and if it carries out the expectations of its projectors it may revolutionize the sugar industries of the world. The Keystone Sugar Refining Co. of this city has established a plant at Riverside on the Philadelphia, Wilmington & Baltimore railroad, just this side of Wilmington, and in a few days the machinery will be put in motion. The scheme is to utilize the waste from the molasses houses, known as "black-strap," and turn out an excellent grade of sugar.

The process is the invention of a man named Kleeman, a German, who has superintended the erection of the machinery at the Riverside refinery. He has one or two large refineries in Germany, which at present are the only ones in the world. The "black-strap" is thrown into a reservoir and thinned with water, and then large quantities of pulverized lignite are thrown in and mixed with the refuse molasses. The process of purifying then takes place, and after passing through a sort of press the lignite and sugar are separated, the lignite being turned out in blocks, which can be used as fuel. By this means there is absolutely no waste.

The lignite is a variety of coal, and the company at present is receiving a supply from Germany, although it is found in large quantities in this country. In Vermont and Alabama there are great fields of it, and deposits of it are found in some parts of New Jersey, but there it is of an inferior quality.

The "black-strap" is to be secured from molasses houses in this city. It has always been a problem puzzling the refiners to find some way of using this waste, but it never was solved until Mr. Kleeman invented his process. The "black-strap" formerly was shipped to Europe, where it was used for coloring cordials, making rum, and for other purposes, but the product has always been in excess of the demand.

Chemical Sugar.

Simultaneously with the above, which we clip from the Philadelphia *Record*, comes another report from Germany as follows:

Much scientific interest if not commercial value attaches to the recent production of chemical sugar in the laboratory of the University of Wurzburg. Glycerine was used as the starting-point in the experiments. After decomposition and treatment with various reagents, a colorless syrup was obtained, which, unlike saccharine, appears to be a genuine sugar, acting in every respect like ordinary natural sugar, except in being incapable of rotating a beam of polarized light. The discoverers, Fischer and Tafel, are now continuing their experiments with a view to giving the lacking optical activity to the new product, which they have named acrose.

MENTAL EVOLUTION.—The following paragraph is interesting and quite significant as showing the gradual advance which the human brain is making in its upward development: Dr. Dight, who is professor of anatomy in the American College of Beirut, Syria, has made a careful comparison of a collection of human skulls, which are stored away in an old monastery in the Kedron valley, midway between Jerusalem and the Dead sea, with skulls of the same race at the present day. The measurements show some significant differences. The Caucasian skull has, during the past 13 centuries, increased in circumference nearly two inches, and has gained in cranial capacity 3½ inches. There has been no increase in the width. The brain has gained in hight and length—*i. e.*, there has been a development of the upper and anterior parts of the brain, the parts which we should expect to increase by education and civilization, as they preside over the moral and intellectual functions. The lower portions of the brain, in which the lower or more selfish propensities are centered, and which give breadth to the head, have, in the march of the centuries, failed to grow as rapidly as the higher brain centers; hence the non-increase in the width of our skulls.

AN INTERESTING PLANT.—We find the following in an exchange, without, however, any given parentage: Last spring a lady living on Mount Bowdoin found 17 four-leaved and one six-leaved clover, all on one plant. It was growing on rooky soil, and she pulled it up, took it home and set it out in her garden. It flourished, but did not increase in size, the roots refusing to spread. All summer it bore four-leaved clover, and in the autumn it was transplanted in a small box and taken indoors. Since that time it has borne 37 four-leaved and a dozen five-leaved clovers.

A REMARKABLE BATTERY.—The Italian papers report that an electric theodolite, which indicates with mathematical precision the position of an enemy's ship, whether at anchor or in movement, has been set up at Maddalena. The battery, which defends the Island of Caprera, is situated in a valley separated from the sea by a high hill. On this is placed electric machinery communicating with the battery. There is also a small "panorama" indicating the position of hostile ships, their direction, their distance from the battery, and the point to which the firing should be directed. The gunners do not see the enemy, but aim high, the balls passing over the hill. On the other hand, the enemy, having no means of ascertaining the situation of the hidden battery, cannot return the fire. The inventor of the machine is one of the heads in the engineers' department of the army, and has gone to Maddalena to direct the installation of the machinery.

Motions of the Earth.

The motions of the earth are somewhat complicated, but readily understood, governed and explained by well-known laws. First, the earth revolves on its axis in 23 hours, 56 minutes and 4 seconds. This time is required for one rotation from a star round to the same star again. The revolution is therefore called a sidereal day. While the earth has been turning on her axis she has been advancing in her orbit, and it will take her about four minutes longer to come to the same position in regard to the sun which it occupied three days before. This adding four minutes to the length of the sidereal day gives 24 hours for the solar day. The time of the axial rotation has not varied the hundredth part of a second in 2000 years. It may, therefore, be considered as invariable, and is consequently adopted as a fundamental unit in astronomical measurement.

The earth revolves in her orbit around the sun in 365.26 days, giving another standard measure of time—the length of the year. The velocity of the earth in her orbit is almost incomprehensible, for the huge sphere spins along at the average rate of 18 miles a second. The earth's orbital revolution and the inclination of her axis to the plane of the ecliptic cause the changes of the seasons and the varying length of day and night.

Precession of the Equinoxes.

The earth has a still more complicated motion, known as the precession of the equinoxes. It consists of a wabbling motion of the pole of the heavens around the pole of the ecliptic in a small circle requiring 25,000 years to complete. It is caused by the attraction of the sun and moon upon the earth at the equator. Consequently ecliptic and equator do not cross at the same point, but the equinoctial falls back each year 50 seconds of a degree. One effect of this movement is to change the polar star, for whatever part of the heavens the pole points the nearest star to, that point is the polar star. The present polar star will no longer enjoy that distinction 3000 years hence, and the brilliant Vega will be the polar star 12,000 years hence.

The earth is also moving through space. The sun, carrying with him the planets, satellites, comets and meteoric bodies following in his train, is hastening toward a point in the constellation Hercules at the rapid pace of 20,000 miles an hour. It might seem that, traveling at this rate, the goal must soon be reached.

Such, however, is the inconceivable distance of the stars that more than a million years must pass before our sun and his family, at their present rate of travel, have spanned the depths of space that intervene between the shining suns of Hercules.

AN ELECTRIC PLANT.—According to *Nature* a curious growth—a strange plant has recently been discovered in India, which possesses to a very high degree astonishing magnetic power. The hand which breaks a leaf from it receives immediately a shock equal to that which is produced by the conductor of an induction coil. At a distance of six meters a magnetic needle is affected by it, and it will be quite deranged if brought near. The energy of this singular influence varies with the hour of the day. All powerful about 2 o'clock in the afternoon, it is absolutely annulled during the night. At the times of storm its intensity augments to striking proportions. During rain the plant seems to succumb and bends its head during a thunder shower; it remains then without force or virtue even if one should shelter it with an umbrella. No shock is felt at that time in breaking the leaves and the needle is unaffected beside it. One never by chance sees a bird or an insect alight on the electric plant; an instinct seems to warn them that they would find there sudden death. It is also important to remark that where it grows none of the magnetic metals are found; neither iron, nor cobalt, nor nickel, an undeniable proof that the electric force belongs exclusively to the plant. Light and heat, phosphorescence, magnetism, electricity, how many mysteries and botanical problems does this wonderful Indian plant conceal within its leaf and flower?

SAND SLOPES.—A Mr. Bolton in recent visits to Egypt and Mount Sinai measured the maximum angle at which dry sand will lie at rest, and found it to be from 31 to 32 degrees; higher than this, it will move down the slope. This does not accord with the well-known formula in text-books.

THE new anti-sawdust law, which goes into effect Sept. 1st, is to be strictly enforced by the State Fish Commissioners.

THE RECORD of meteorological observations kept at the Paris observatory was begun in 1666.

ELECTRICITY.

Definition of Electrical Terms.

Electricity having become so large a factor in every-day reading, our readers who are not thoroughly posted will, no doubt, be pleased to study carefully the following definitions of electrical terms, which we clip from *Power and Steam*, N. Y.:

The manner in which work is done by a current of electricity traversing the wire is in some respects analogous to the manner in which work is done by a current of water flowing in a pipe. If the pipe is horizontal the water has no tendency to flow one way or the other, and can do no work. If the pipe be raised to a vertical position the water will flow out at the lower end, and if it there operated upon a perfect water-wheel belted to a perfect pump, enough work would be done by the fall of water to raise the same water to again fill the pipe.

The ability which the water has when in an elevated position to do work when falling is called its potential.

Electricity, like water, does work by virtue of its potential. There is a difference, however, between the potential of water and that of electricity. When the potential of water has expended itself in useful work we still have the water just the same as before, but when the potential of electricity has expended itself in work the electricity vanishes absolutely. We have no knowledge as to what has become of it.

Difference of potential is the difference between any given potential and another potential with which it may compare.

In dealing with electricity, difference of potential is called electro-motive force. It is usually written E. M. F. The unit of E. M. F. is the volt. Its value is purely arbitrary, but fixed. One volt will force one ampere of current through one ohm of electrical resistance.

Electrical resistance is that which impedes the flow of electricity. It is a property possessed by all substances to a greater or less degree. The unit of electrical resistance is the ohm, which in formulæ is usually symbolized by R. The value of the ohm is not absolutely known, but in 1886 electricians agreed to consider it for ten years as equal to the resistance offered to a current of electricity by a column of pure mercury one square centimeter in section and 106 centimeters long, at the temperature of melting ice. A round copper wire of 95 per cent conductivity, one-thousandth of an inch in diameter and one foot long, has a resistance of about 10.9 ohms. One ohm is that resistance through which one ampere of current will flow at a pressure of one volt E. M. F.

The rate of flow or current of electricity is measured in amperes.

One ampere is that quantity of electricity which flows per second through one ohm of resistance when impelled by one volt of E. M. F. One ampere through a silver-plating bath deposits 0.017253 grains of silver per second. Through a copper bath it will deposit 0.005084 grains of copper per second. The rate of deposition of silver or copper is one of the most accurate and reliable means of ascertaining current strength.

The unit of electro-dynamic quantity is the coulomb, and is of the value of one ampere of current. For example, a current of one ampere in one second would transmit one coulomb. A current of ten amperes would transmit in two seconds 20 coulombs. A current of 80 amperes in one minute transmits $80 \times 60 = 4800$ coulombs. The relations which exist between E. M. F., resistance and current are known as Ohm's law. Its simplest expressions are as follows:

In an electrical circuit the current in amperes may be found by dividing the E. M. F. in volts by the resistance in ohms.

From the last three proportions it may be seen that in a given resistance an increase of E. M. F. must be accompanied by a proportional increase of current; or an increase of current must be accompanied by a proportional increase of E. M. F.; but an increase of resistance will be accompanied by a proportional increase of E. M. F., or a proportional decrease of current; and a decrease of resistance will be accompanied by a proportional decrease of E. M. F. or a proportional increase of current.

According to these relations, it is seen that C. and R. are each the reciprocal of the other, multiplied by E.; that is to say, that C. and R. limit and define each other where E. is a fixed quantity.

The joule is the unit of energy, and is the work expended in forcing one coulomb through one ohm; it is equal to .7373 foot-pound.

In a given resistance, energy, such as work or heat, varies as the square of the current or of the electro-motive force; that is, by doubling the E. M. F. the energy becomes four times as great; by trebling the E. M. F. the energy is nine times as great.

Power is the rate of doing work, and is proportional to the E. M. F. multiplied by the current. The watt is the unit of electrical power. One volt multiplied by one ampere equals one watt. Power also varies to the square of the E. M. F.

It is evident that, by doubling the current in a fixed resistance, the E. M. F. must be doubled. Hence it follows that the power varies as to the square of the current. That is, by doubling the C. or E. M. F. the power is four times as great; by trebling the C. or E. M. F. the power is nine times as great.

One electrical horse-power equals 746 watts. That is to say, a current of one ampere and 746 volts would be one electrical horse-power.

And one horse-power expended wholly in producing electric energy would generate one ampere in 746 ohms resistance, or 746 amperes in one ohm resistance.

In reading French text-books, it must be remembered that the "cheval vapeur," or French horse-power, equals only 736 watts.

Work varies as to the quantity of electricity and the E. M. F. That is to say, the same amount of work is done when one coulomb falls one volt, whether it falls quickly or slowly; in other words, whether it is obstructed by a small or a large resistance. But one coulomb in passing one ohm will do little or much work, in proportion as it passes quickly or slowly. Thus, if a coulomb goes against an ohm in three seconds, it goes at the rate of one-third of an ampere, and consequently at a pressure of one-third of a volt, and a coulomb and a third of a volt means one-third of a joule of work. But if the same coulomb were to pass in a twentieth of a second, it would go at the rate of 20 amperes, and consequently 20 volts; in this case it would obviously do 20 joules of work.

E. M. F. is distributed according to the resistance of the various parts of the circuit, except where there is a counter E. M. F.

Counter E. M. F. is like back pressure in hydraulics. Thus, to find the available E. M. F., or the resulting current against a resistance where there is a counter E. M. F., the counter E. M. F. must be deducted.

GOOD HEALTH.

Living for Centuries.

Everybody is more or less excited just now over Brown-Sequard's supposed discovery of the elixir of life, the doctors are experimenting with the mysterious rejuvenator, and all the old people are fondly looking forward to the hour when they will throw away their spectacles and canes, rheumatism and lumbago, and in the flush of youth begin the drama of life over again. The pleasing delusion, if such it should prove to be, is by no means a novel one. More than once has the world gone wild over the Rosicrucian dream of physical immortality. There have always been a few occult philosophers who believed that the secret of longevity possessed by the old Silurians before the flood had not been lost; that Noah brought it safely over the deluge in the Ark, and that it was for ages preserved among the mysteries of Egypt.

The theosophists, and they are almost as numerous in our community as blackberries, believe there are men now actually existing who have by the observance of certain occult rules attained the age of two, three, four and even six hundred years. These adepts, as they are called, are rarely ever seen, as their bodies have become so etherealized and their tastes so exquisitely refined that they cannot endure our ordinary modes of life. They live in select brotherhoods in the quiet and seclusion of mountains and never meddle with mundane affairs. They are merely distant spectators of what is passing in the world, and as they make no disciples, have no confidants, obey all codes, conform to all laws, they pass through the world unnoticed, and only a few chelas or initiates are aware of their existence. There are many who believe that Nicolas Flamel, a Hermetic philosopher of the fourteenth century, is still alive and was actually seen as late as the end of the last century. The strange story of his life, as narrated by Sieur Paul Lucas, who claims to have met him at Broussa, is enough to form a plot for Rider Haggard. The legend of the "Wandering Jew" by Croly, "Zanoni" and the "Strange Story" by Bulwer are three specimens of the way this enchanting fancy has become embalmed in literature.

In the year 1883 the Putnams published a little book by Mr. Hyland C. Kirk, entitled the "Possibility of not Dying," that for a short time excited the attention of the curious. About a year ago, Dr. William A. Hammond gave the public several papers in which he gravely stated that there were no physiological reasons why a man should not live forever. He contended that the body of a man differs from any inorganic machine in the fact that it possesses the power of self-repair. In the steam engine, for instance, the fuel that serves for the production of force can do nothing toward the repair of the parts worn by friction, and hence every day the engine becomes less perfect till at last it is worn out. But the animal body is no such machine. Here the material which serves for the production of force is assimilated according to the character of the organs and parts that require it. There is a constant change going on, the hair of yesterday is not the hair of to-day, and the muscles that extended the arm an hour ago are not now identically the same. The old material passes away and new material takes the place. Now, just so long as this double action, this law of flux and reflux, balance each other, life continues. Were it possible to so adjust waste and repair that neither would be in excess, there is no reason why life, if protected from accidents, may not continue indefinitely. Eternity is long, and Dr. Hammond, who certainly has won some distinction as a physiologist, predicts that some time humanity is sure to discover the secret of prolonging life for centuries, if not forever.

At present it hardly seems possible that human knowledge can progress so far. We would be willing to compromise at say, 300 years, but be all this as it may, one thing is certain, that civilization is lengthening the average duration of life. Our sanitary knowledge and our knowledge of the means of preventing disease are augmented day by day, until now, in many respects, they are quite perfect. Our list of preventable diseases is already a long one; the almost complete suppression of cholera and smallpox, to say nothing of the absolute abolition in all civilized lands of the plague, blackdeath, sweating sickness, and other malignant diseases that once dug graveyards in a day, are only prophetic of still greater triumphs of the healing art. As a result, the life of a generation has increased six years in the last half century, and there is hardly any reason to doubt that the old Bible promise of three score years and ten may not some day become the average duration of human life.

REGULATING ONE'S WEIGHT.—To increase the weight: Eat to the extent of satisfying a natural appetite, of fat meats, butter, cream, milk, cocoa, chocolate, bread, potatoes, peas, parsnips, carrots, beets, farinaceous food, or Indian corn, rice, tapioca, sago, cornstarch, pastry, custards, oatmeal, sugar, sweet wines, and ale. Avoid acids. Exercise as little as possible, sleep all you can, and don't worry or fret. To reduce the weight: Eat, to the extent of satisfying a natural appetite, of lean meat, poultry, game, eggs, milk moderately, green vegetables, turnips, succulent fruits, tea or coffee. Drink lime juice, lemonade, and acid drinks. Avoid fat, butter, cream, sugar, pastry, rice, sago, tapioca, cornstarch, potatoes, carrots, beets, parsnips and sweet wines. Exercise freely.—*Kansas City Medical Index.*

TURPENTINE BATHS FOR RHEUMATIC PAINS.—Make a concentrated emulsion of black soap, 200 grammes; add thereto 100 or 150 grammes of turpentine, and shake the whole vigorously until a beautiful creamy emulsion is obtained. For a bath take half of this mixture, which possesses an agreeable pine odor. After remaining in the bath a quarter of an hour, the patient should get into bed, when a prickling sensation, not disagreeable, however, is felt over the entire body; then, after a nap, he awakens with marked diminution of rheumatic pains.—*Practical Medicine.*

FEMALE PHYSICIANS.—The question of female physicians has been settled in Russia in the affirmative, with the stipulation that ladies shall only attend on adults of their own sex, and on children of both sexes.

REMEDIES.—There are about 11,000 remedies mentioned in the 15th edition of the "United States Dispensatory." Each ill that flesh is heir to must be more than well drugged.

USEFUL INFORMATION.

What Salt Will Do.

Salt in whitewash will make it stick better.

Wash the mica of the stove doors with salt and vinegar.

Brasswork can be kept beautifully bright by occasionally rubbing with salt and vinegar.

Damp salt will remove the discoloration of cups and saucers caused by tea and careless washing.

When broiling a steak, throw a little salt on the coals and the blaze from dripping fat will not annoy.

To clean willow furniture, use salt and water. Apply it with a nail-brush, scrub well and dry thoroughly.

If, after having a tooth pulled, the mouth is filled with salt and water, it will allay the danger of having a hemorrhage.

Salt as a tooth-powder is better than almost anything that can be bought. It keeps the teeth brilliantly white and the gums hard and rosy.

Carpets may be greatly brightened by first sweeping thoroughly and then going over them with a clean cloth and clear salt and water. Use a cupful of coarse salt to a large basin of water.

If the feet are tender or painful after long standing or walking, great relief can be had by bathing them in salt and water. A handful of salt to a gallon of water is the right proportion. Have the water as hot as can comfortably be borne.

TREE POISON.—An invention has been patented in New Zealand and in the other colonies which, if it does all that is claimed for it, will revolutionize the settlement of bush lands. It is a composition which, when trees are inoculated with it, mingles itself with the sap and circulates through every branch and leaf, utterly destroying the life and rendering the standing tree in three months' time dead and rotten, and so highly inflammable that when fired it burns away literally root and branch, for the fire creeps even down the roots into the ground, consuming them so thoroughly that the land can be plowed afterward. It is available also for old stumps, thus doing in a month what Nature takes years to accomplish. The process of inoculation is simplicity itself, requiring little labor. It is simply the boring of a hole about six inches into the tree with an inch auger, filling with composition and afterward plugging with cork, tough clay, or other suitable substance. It has had several trials, and has done effectual work in all cases, in one instance 700 acres having been cleared with it, every tree being successfully dealt with. It is also very inexpensive, not costing more than a few pence even for a large tree.

PRESERVING FRUIT IN SAND.—It is said that the Italians have a method of preserving citrus fruits in sand. An excavation of from four to seven feet is made, and a board floor put in it. Upon this floor about three inches of clear dry sand is placed. The fruit (orange or lemon) is carefully cut from the tree and wrapped in tissue paper. The fruit is then laid upon the sand in such a manner that the wraps do not touch each other. Three inches more of the sand is then spread on the oranges, and another layer then put down in the same manner as the first, and so on, until there are three tiers of either. If more than three tiers are laid down the underneath oranges are crushed. Sand to the depth of seven or eight inches is then spread over the whole. Oranges are frequently kept for months by this process and kindred methods. All authorities are agreed that oranges and lemons, which are intended to be preserved, should be cut, not torn, from the tree. A similar method has been adopted by a grower of oranges in South Africa, and the fruit comes out of the "silo," as he calls it, in famous condition, at a time when oranges are scarce and yield good prices. Sweet potatoes may be preserved in the same manner.

WHAT BECOMES OF ALL THE PAPER?—There are over 1000 paper-pulp mills in constant operation in the United States, and the question is often asked: "What becomes of all the paper which is manufactured from this pulp?" The 15,000 different newspaper publications, daily, weekly and monthly, must use immense quantities. The Century Company alone takes nearly 200 tons a month for its publications. Harper & Brothers take 25,000 reams, and Robert Bonner 10,000 reams at a time. Two cheap-literature firms buy $500,000 worth of paper. One patent-medicine firm buys $300,000 worth of paper every year. As we have before said, there are more paper-mills, running more machines, in the United States than in any other country in the world. Germany has nearly as many, but no other country has half as many.

TO DISTINGUISH A GENUINE DIAMOND.—It is said that an expert is no longer required to tell whether a diamond is genuine or not. The test is simple, and can be made in any place and in a moment. All you need is a piece of paper and a lead pencil. With the latter make a small dot on the paper, then look at it through the diamond. If you can see but one dot you can depend upon it that the stone is genuine, but if the mark is scattered, or shows more than one, you will be perfectly safe in refusing to pay ten cents for a stone that may be offered you at $500. Of course a diamond to be subjected to such an examination must either be without its setting, or so mounted that the light will pass through it perpendicularly.

SAN FRANCISCO A RICH CITY.—The total indebtedness of this city, according to the annual report of the Auditor, is $902,811.11. This in itself is a remarkably fine showing for a municipality as large and progressive as San Francisco, but when compared with the total assets the indebtedness is astonishingly insignificant. The present value of city property is estimated at $50,000,000, and includes both City Halls, jails, reformatory institutions, engine and school houses and lots, outside lands, water lots, parks, and all the various apparatus and furnishings of all the city institutions. Most of the landed property of the city is growing in value constantly, so that the assets will keep on increasing.

ONE OF THE LATEST NOVELTIES is a window in umbrellas. This window consists of a small oval piece of glass with a silver or brass frame, which is easily mounted in a rib of the umbrella, while it is fixed to the silk by sewing it through the little perforated holes in the frame. These windows can be placed in new or old umbrellas in a manner which will not injure the fabric in the least. As to whether the umbrella will roll up tightly has not, however, been made apparent. By the use of such a contrivance, unpleasant collisions on rainy days may be avoided and many hard words between pedestrians saved.

A PECULIAR-SHAPED POTATO.—Potatoes often assume most peculiar shapes. S. Hodapp of Isleton has sent to the *Call* of this city a potato which for oddness of shape it would be difficult to find a mate to. The potato weighs about a pound and a half and resembles perfectly a small dog sitting on its haunches, with its forepaws outstretched. The only malformation is in the head, the forehead extending upward to a rather disproportionate hight. Altogether the potato is a genuine freak of nature.

TO SCATTER A CROWD.—A new way to scatter a crowd has been discovered. A man who found himself hemmed in by a dense throng near State and Washington streets, Boston, recently, while the circus procession was passing, pulled a bottle of ammonia from his pocket and spilled the contents promiscuously about. He had the entire sidewalk to himself in less than a minute.

Passing Events.

The Sierra Buttes mine, Sierra City, after running successfully for over 30 years, closed down this week. The mine belongs to the same English company that owns the Plumas-Eureka, Plumas county, and the Uncle Sam, Shasta county. The Sierra Buttes has had poor ore for the past two years. It was the most important mine at Sierra City, employing a large number of men.

The official trial trip of the cruiser Charleston is reported as successful, and it is expected that the vessel will be accepted by the Government. She developed high speed, though the horse-power did not quite come up to requirements.

The Commonwealth mine, Tuscarora, has made its last bullion shipment for the present and until another system of ore reduction is employed. Great numbers of miners have left the camp in consequence of the shut-down.

The Golden Gate river-bed claim on the Feather has turned the river into its new flume and in a few days will test the gravel in the bed of the river. This is very close to the old Cape claim, which is famous among miners for its richness.

Margins on Mining Stocks.

An important decision was rendered the past week by Judge Hoge in the case of Carlson vs. Goldman. Mrs. Carlson brought suit against Goldman to recover $600 paid on account for purchases of mining stocks on margin. The evidence went to show that she paid Goldman & Co. the money with which to purchase the stock, and failing to make good her margin, caused by a decline in the market price of the stock, she was sold out. Her counsel relied on the section of the Constitution which provides that all contracts for moneys paid for purchases and sales of stocks on margin shall be void and the payee may recover back the amount.

In deciding the case, Judge Hoge stated that from the evidence he did not think this case within the constitutional provisions. Says the Judge:

There has been, in fact, no sale on margin by Goldman. He was shown to be operating only as plaintiff's broker, he agreeing to advance the money necessary to make the purchase and plaintiff agreeing to pay from time to time. The contract of sale is perfectly concluded and the title to the stocks vests fully in the plaintiff. She could control them, order them sold at any time, and the amount they bring goes first to compensate the broker for his advances and the balance is paid over to her. The court thinks the transaction between Mrs. Carlson and the broker was a fair business proposition, in which one man acting as broker and agent for another agrees to make advances and charge interest; the other agrees to pay interest and to pay from time to time and does so. This is plainly not within the intended prohibitions of the gambling transactions known as buying and selling stocks on margin, which were designed to be checked by the constitutional provisions cited. Judgment is accordingly given for the defendant.

In deciding the case, it will be seen that Judge Hoge virtually decides another point that has been in controversy, viz., the legality of voting at the annual elections of incorporated companies by proxy of stock not owned or controlled by the person giving the proxy.

River Mining.

We had a call this week from Mr. S. N. Harris, superintendent of the Golden Gate Alluvial Syndicate which is about to work a section of the Feather river near Oroville. By next week it is expected that they will be able to begin the work in the bed of the river. A sub-flume is now being built for the seepage, the big flume having been completed and the water turned in. The flume carries the whole of the water of the river. Martin elevators will be used for pumping, and afterward for raising the gravel.

This claim is principally owned by English capital, who furnished the money for building the dam, flumes, etc. Mr. Harris and Major McLaughlin are part owners. The foot dam of the mining ground just laps on to the famous old Cape claim which yielded such enormous amounts of gold in early days.

The flume in the Golden Gate is a very large one. It is on a grade of one inch to 16 feet. At the head it is 50 feet wide and six feet deep, narrowing in width in 500 feet to 32 feet, and so continuing for 2800 feet farther, the last 2800 feet being five feet deep. The flume carries now 60,000 miners' inches of water with a depth of two feet carrying the whole river at its present stage.

There is a crib dam 50 feet high with a 40 foot waste-way, 10 feet deep, which will take a pretty good rise of the river. The first rise will not wash them out, as is apt to be the case with many of these river dams. Every precaution has been taken to stand a good rise without danger. It often happens that river miners can get in a month or two months' more work if they can stand the first rise. This dam is built to stand any ordinary winter.

The company will have quite a stretch of river-bed to work, and it is the expectation to work it all out in the next three months. The gravel is supposed to be from six to eight feet deep. We shall shortly give a detailed description of this large flume which has several peculiarities that will interest river miners.

THE ancient beach of Mono lake is about 700 feet above the present surface of the lake. It is a far greater elevation than any other lake margin in the United States.

GRAVEL containing gold in paying quantities is said to have recently been discovered at the head of Mill creek, Washoe county, Nev.

The Mining Bureau Fund.

It will be remembered that the last Legislature made an appropriation of $100,000 for the support of the State Mining Bureau, with the provision that a certain proportion should be expended in the field. When, however, application was made to State Controller Dunn for certain moneys out of this appropriation, he refused payment on the ground that the bill making the appropriation was improperly drawn, and there was nothing to indicate from what fund he was to pay. He therefore declined to pay the bills of the bureau. One man who had furnished supplies to the bureau on being refused payment asked the Supreme Court to issue a writ of mandate compelling the State Controller to pay his account. This has been under advisement for some time, but this week the Supreme Court issued the mandate instructing the Controller to pay the amount. The issuance of this writ sets the matter in controversy at rest and practically declares legal the appropriation for the bureau.

A couple of months' valuable time has been lost this summer, for the bureau has had no money with which to work, and most of the employes have been discharged. State Mineralogist Irelan will, however, make up for the lost time as best he can, and as soon as possible will have a corps of assistants at work in the field. It is understood that several branches connected with the objects of the bureau will be thoroughly examined and reported on, aside from the ordinary routine work. With the experience he has gained in field work in the past two years, Mr. Irelan will doubtless be able to give the public an exceptionally useful and practical report. He has personally visited most of the mining regions of the State, and familiarized himself with the wants of the mining community. Many localities will be described in more detail than has been the case in former reports, as the amount of the appropriation is sufficient to enable him to employ as many assistants as may be necessary.

The Railroads and Mineral Land.

A test suit has been brought in the U. S. District Court, Northern District of California, entitled Geo. H. Francoein vs. Oscar Newhouse, which involves the title to the Eagle Bird quartz mine, lot 52, township 17, north range 11 east, section 13, Mt. Diablo meridian, Marysville Land District.

The plaintiff claims title under the grant to the C. P. R. R., and the defendant claims by location under the U. S. mining laws and U. S. patent which has been issued to him. The railroad company wants to go behind the U. S. patent. It claims the title to the land patented was vested in the R. R. Co. by virtue of its grant from Congress and the land was returned as agricultural, not mineral. The question is whether the mineral went to the railroad company or not. The miners claim that the land did not pass to the railroad company, but being mineral was exempted from the grant, and that the title does not vest in the railroad company until patent issues. In this case no patent has issued to the company, but one has issued to the mine-owner. This test case involves title to a tract of land 72 miles long by 20 wide, in which are included some valuable mineral properties. There are a number of cases pending in the U. S. Court in which the same question is involved.

The Mechanics' Fair.

The opening exercises at the Grand Opera-house Tuesday afternoon were well attended. Pres. Kerr in his introductory remarks said that the Institute now has 4000 members, a library of 50,000 volumes, and property worth net $1,000,000. Irving M. Scott delivered an oration tracing the development of industrial arts and civilization, from remote antiquity to the present day, which is commended as instructive and entertaining throughout.

In the evening the doors of the Pavilion were thrown open, and thousands of visitors enjoyed the excellent music and inspected such of the exhibits as were already in their places.

F. A. HUNTINGTON, the manufacturer of the Huntington mill and other mining machinery, has removed from his old place on Fremont street, near Mission, to No. 213 First street, where he has better facilities and more room.

The Elevators of the Eiffel Tower.

(*Continued from page 161*)

two extremities of the *palonniers*, and support the elevator-cage, *B*, in passing over the pulies fixed at the summit of the tower. Two of these cables are attached to the cage itself, and the other two are fixed upon the *palonnier*, at the center of which the cage is suspended.

With a surface of 14 square meters, the cages can accommodate 63 persons and transport 750 in an hour, the duration of each trip of ascent and descent being five minutes. The weight of each cage loaded is 8000 kilogrammes, 4000 kilogr. for the cage itself, and 4000 for the passengers. Each cage going only one-half of the whole distance to be traversed, a change takes place at the intermediate floor, by two distinct roads, which permits great celerity in the service.

Over all the distance traveled, the two pistons are protected by a hollow cast-iron column, affording an opening for the passage of the *palonnier* and provided with several bearings serving for guidance and against which the piston can find support in the event it should be necessary. The suspension cables of the cage *B* pass through the same column.

On all the hight comprised, on the other hand, between the second story and the intermediate floor, the cages are guided by two cast-iron columns like the former, which inclose also and protect the suspension cables of cage *B*.

The means of transmission; pistons and cables, as is seen, are protected by sheaths, except the cables of cage *B*, which are fixed upon the cross-beams of the tower by curtain-bands in the upper part.

If we consider the operation and movement of the cages, we ascertain that four points are presented. 1. The cage *A* is empty and cage *B* only is loaded. 2. The cages *A* and *B* are both loaded. 3. The two cages are empty. 4. Cage *A* only is loaded. Examining the first and fourth cases, M. Grosclaude, Engineer of Arts and Manufactures, studies the weight which it is necessary to give to the pistons. Admitting that the weight of each cage will be 4000 kilogr., the weight of water displaced by meter for the two pistons would be 160 kilogr. the weight of the passengers 4000 kilogr. and the action due to friction 2400 kilogr. In the first case the system is put in motion with pistons of 19,200 kilogr.; in the fourth, the total section of the pistons being 1600 square centimeters, the pressure of water is 8 kilogr. per square centimeter. The ascent of cage *B*, which corresponds to the descent of cage *A*, is systematically regulated. The pistons are composed of two tubular parts, one of steel, the other of iron, and each weighs 9600 kilogr. The upper portion is formed of a steel tube 60 meters in length, weighing 3900 kilogr. The difference, 9600 – 3900 = 5700, represents the weight of the lower portions in iron.

A distributer also feeds the two cylinders, thus assuring in each of them an equal admission, giving for the pistons equal displacements. A reservoir of a capacity of about 20,000 liters at the top of the tower feeds this distributer. The water is led into the reservoir by two pumps of 25 liters each, placed at the lower part of the tower and raising the water to a hight of about 276 meters. The escapement water from the cylinders returning to the pumps comes upon the pistons with a pressure corresponding to a hight of 196 meters; the actual hight to which it is necessary to raise the water is then not more than 276—196 = 80 meters. In reality, the force to develop is a little greater, because of the loss of load. Generally the two pumps work together; they work separately only when the visitors are few.

The descent of cage *B*, if necessary, can be stopped by means of a resting brake, upon the helicoidal principle. This brake system is simple and ingenious. Each cage is guided toward its summit by breasts or teats bearing upon vertical slides and terminated at their lower part by conical bearings. At the same time that the cage moves in the cylinders forming the support of the slides, blocks gliding in helicoidal grooves present at their summit an evident conique corresponding to the conical bearing which we have indicated upon the breasts. The blocks and the breasts or teats being traversed by the cables if the latter should break, the blocks would stop in their sheaves, and support by means of the breasts the weight of the cage.

Working a Coal Mine in China.

The Tong colliery is about 80 miles northeast of Tientsin, China. The coal-beds have a dip south of about 45°, and are interstratified with sandstone, shale, indurated clay, and fireclay. Of the 17 beds discovered, nine are workable. The coal is bituminous. The floor of the coal-bed is invariably fire-clay, which is full of fossil stigmaria and calamites, showing it to have been the ancient soil of this carboniferous vegetation. The mine and the methods of working were described by J. M. Silliman before the American Institute of Mining Engineers some time since. Fig. 1 of the cuts is a map of the district. Fig. 2 shows a vertical transverse section through the coal-bed. Figs. 3 and 4 show the two shafts. These shafts are each 14 feet in diameter and are 100 feet apart. Shaft No. 1 is the downcast (560 feet deep) and No. 2 is the upcast. They are walled up with limestone, the stones being cut to fit the circular form; a block of the first section costs but five cents. The compartments for winding and pumping are shown in Figs. 3 and 4.

(To be Continued.)

Fig. 1.—MAP OF KAIPING COAL FIELD, NORTH CHINA.

Patent-Selling Agencies.

How Inventors are Sometimes Swindled.

The following letter received this week is a sample of those frequently sent to us asking for information concerning some of the numerous patent-selling agencies which send out circulars to inventors:

Messrs. Dewey & Co.—GENTLEMEN: The Blank Patent Co. of your place effected a sale, as they said, of my patent, and wrote me that I must send $22 to pay examination fees. They had taken it at $600 net to me, and I was to be at no expense. When they required this additional amount of me I naturally concluded it was simply a confidence game and they were "working" $22 out of me, especially as the party to whom they were selling wrote me a "hurry-or-you'll-lose-the-trade" letter. Now will you please inform me whether or not these men are reliable? Also is it the regular thing to charge $22 examination fees out of the party selling in advance? G. W.

Felton, Ga., Aug. 17, 1889.

A general answer to this may benefit other inventors who are not familiar with the ways of some of these patent-selling agencies.

When a patent issues, the patentee's or assignee's name is published in the Official Gazette of the United States Patent Office, and he will soon be flooded with circulars from all parts of the country. Some of these are from reliable and honest attorneys, but many are from professional swindlers who make a living by cheating patentees.

An explanation of a few of their methods will aid you in recognizing them when you see them.

One circular professes to come from a firm having a system of patent-selling agencies in all of the principal cities in the United States; that they will undertake to sell your patent for a slight commission if you will send them five or ten dollars to pay for copies of your patent. These copies, they say, are to be sent to their different agencies, and various means adopted to attract the attention of those in the line of business to which your invention relates, and you will soon be the possessor of hundreds or thousands of dollars realized from the sales which they will make. If you send the money for the copies of the patent, it is the last you will hear from it.

Another party will send you a circular intimating that he has had an inquiry made in regard to your patent, and that if you send him a power of attorney he will endeavor to make a sale for you. If you send him a power of attorney, he will write back that he cannot dispose of the patent, but can get $5000 or $10,000 for your Canadian patent (he has first examined and found that you have no Canadian patent), but "if you have no such patent, will hold offer till you get one, if you do so at once. Ten per cent for selling; total cost of Canadian patent through me is $20; this includes Government fee $20, and my fee $20; but in view of the sale will wait for my fee ($20) until patent is sold. Upon receipt of Government fee, I will prepare documents and send them to you to sign. If you cannot accept, say so, and do not ask me to advance the fee, as I am not permitted to do so as solicitor." Of course, if a second thought is bestowed upon this letter, the swindle becomes very apparent. The language itself is obscure, and the last sentence shows the true character of the individual from whom it comes. Accompanying this letter is a certificate from an alleged notary, certifying to the character of the anxious solicitor. Any one sending him money to pay for such a fee cannot expect to receive anything in return, and must not feel disappointed when weeks and months elapse and nothing is heard from their Canadian patent.

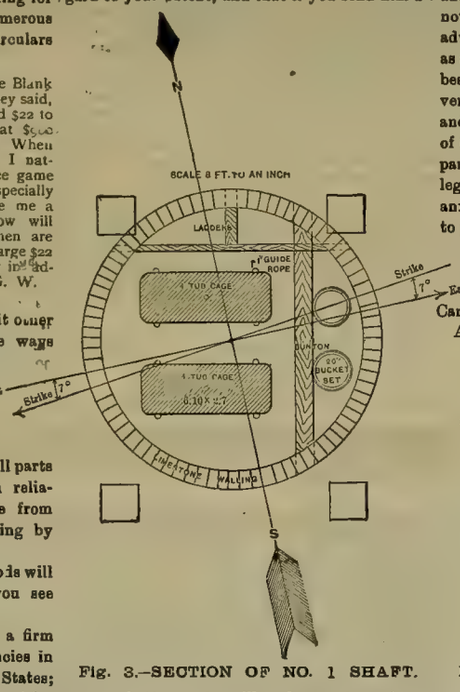

Fig. 3.—SECTION OF NO. 1 SHAFT.

Another swindling institution which has paid particular attention to patentees on the Pacific Coast, adopts the following modus operandi: First, you receive a well-worded circular letter, saying they believe your invention is valuable, and after going to some length in telling its value, they inform you that they are in the patent-selling business and would like to take hold of your patent. It will be necessary to send them but a small amount—usually $4.50 or an equally odd sum—to buy copies of your patent and pay for some other little matters. When they get the money from you they send to Washington and get *one* copy of your patent, print a small advertisement on it, and send it to you saying that it is a *sample* of what they are sending out. In a short time they write you again and say that one of their branch houses has been successful and can dispose of your patent for a piece of property in a distant city; but they also call upon you for $22 or so to pay the expenses incurred by the branch house. As a man is led to believe that he is soon to come into possession of land worth many thousands, it is presumed that he would not delay to give $22 or a like amount in advance of the realization of his bright prospects. If he sends it he does not get any return but a little disappointment, and although "sadder," he is a much "wiser man."

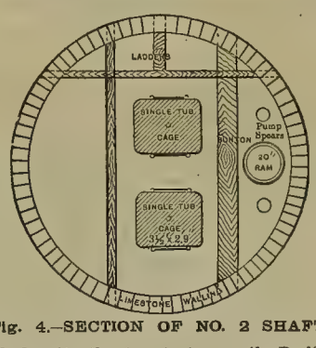

Fig. 4.—SECTION OF NO. 2 SHAFT.

The so-called patent sellers rarely effect a bona-fide sale. They depend upon the advance fees obtained as above for a livelihood. Some of them have thus grown rich and prosperous.

One of the latest tricks is the following: The patentee receives a letter from A & B asking for how much he will sell his patent for such and such a State. He replies, giving a price, say $5000. The patentee soon after receives a letter from X Y Z saying that A & B write they "have corresponded with you, and now say they have decided to purchase the patent on the terms named, provided the title and claims are found to be correct. To ascertain this, they require that X Y Z shall examine and report upon the patent, otherwise A & B will not purchase; that if the patentee wishes to complete the sale he must remit $22 to pay for the examination, which is a work independent of the sale and must be independently paid." The inventor sends the money; a report is made adverse to the patentee; no purchase is made; none was ever intended. Of course X Y Z and A & B were in reality the same people.

There are many other schemes adopted to secure money from patentees, but they are all of the same general character.

The United States Patent Office publishes an Official Gazette every week which gives the name and address of each patentee. These parties who derive their income from the ways here shown take this Official Gazette and send circulars to each person who has taken out a patent, and it is easy to believe that they have quite a comfortable income if only a small proportion of the patentees send money. Those who have been duped out of small sums hesitate to make the matter public.

These unscrupulous persons have no intention of returning an equivalent

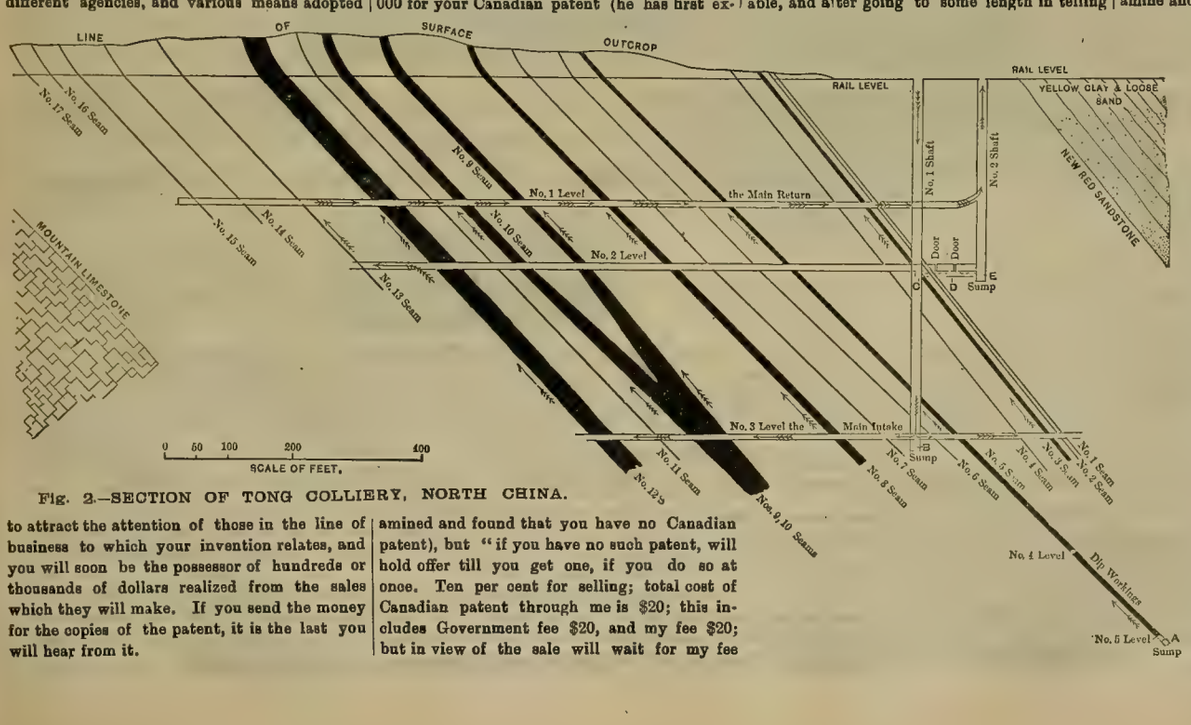

Fig. 2.—SECTION OF TONG COLLIERY, NORTH CHINA.

for the money they receive. The best way for a patentee to do is to make his invention as widely known as possible by advertising or by correspondence with manufacturers who are in that particular line of business. If they do employ patent-selling agencies, only those thoroughly well recommended should be dealt with. It should be remembered, moreover, that bona fide patent agencies, of first-class character, do not also engage in the business of selling patents. The two classes of business are entirely distinct and separate.

Assaying Notes.

[NUMBER 3.]

Testing Lead Ores by Crucible.

The ores of lead can be assayed for percentage of metal more promptly than those of gold and silver; but great care must be taken to understand the constitution of the mineral, if accuracy is essential; unless the deficiency of knowledge for exact fluxation is rendered unnecessary by relying on the universal action of and chemical changes produced by fire during a preliminary roasting at a low red heat when stirred for some 20 minutes.

All lead ores that are valuable to the miner as such when thus roasted, as well as those several unroasted ores of carbonate, chromate, phosphate, and oxide of lead, may be fluxed in the following manner, according to the late J. S. Phillips in his "Explorers, Miners and Metallurgists' Companion":

A. Average your sample with great care; take 25 grains of ore, which project, by a long-handled scoop, into your red-hot crucible; then, after quickly covering this with 100 grains of carbonate of soda, close the furnace for from 15 to 20 minutes, when you may remove the crucible from the fire, tap it lightly to precipitate and unite the molten globules of lead, and when the crucible becomes quite cold it may be broken, and after the bottom has been brushed clean and weighed, the ore's percentage may be known by multiplying this weight by four (or 100 grains may be taken).

This will extract as much lead (when properly conducted) from all classes of ores as any other mode, and even when sulphuret of antimony is also present the latter will not be reduced by these fluxes, but will volatilize and combine to form slag.

For ordinary purposes, even the worst ore, that of sulphuret of lead (galena) and antimony, need not be roasted.

The sulphuret of antimony is often associated with that of lead in the Pacific States and Territories, and when it is present this mode will be found all-sufficient.

When antimony is present an iron crucible must not be used, as it also reduces the sulphuret of antimony to metal.

B. Should it be required to ascertain, also, the percentage of antimony, the same quantity of ore may be treated as above for lead; but for both lead and antimony: to this end the 25 grains of ore must be fused with an intimate mixture of 75 grains of carbonate of soda and 75 grains of cyanide of potassium, which will reduce both metals; and this weight, multiplied by 4, will give the percentage of alloy, while the former percentage of lead being deducted therefrom, the difference will give the weight of antimony.

The purity of lead is best ascertained by flattening the button to a very thin disk, so that its edge may be characterized by absence of cracks, and for its ductility and tenacity, while the middle may be still bent repeatedly without fracture.

The above modes are universal and reliable for all the ores of lead which are of any value to the miner.

There are several other methods practiced in different districts for assaying pure galena, but they require much discretion, where there is any chance for associations of antimony, etc., or errors will be the result.

This carefully averaged sample of 25 grains may be smelted either in muffle or open fire, but if more is taken the larger crucible will require an open fire.

It will be advisable to assay in duplicate, when exactitude is required, and to withdraw at the separate periods of 15 and 20 minutes, so that the larger of the two buttons may be accredited for value.

If copper is present in the ore, a more moderate heat and less time may be advantageously given, so that as little copper as possible may be reduced therewith.

Copper may be also dissolved out from the weighed sample by a little dilute sulphuric acid, then watered, poured off and dried over lamp, sand-bath or other convenience, before fusion.

FORCE OF RUNNING WATER.—In the Conemaugh river stood a bowlder of granite eight feet in diameter and five feet high. The flood split it in two, carrying parts of it a distance down the stream. The writer has seen a bowlder fully four times the size of the one above referred to moved quite a distance by the waters of Deer creek, just below Nevada.

COTTON AND WOOL.

The Wool Trade of Persia and Transcaucasia.

The following observations on the wool trade in Persia and the adjacent regions are from a report recently issued by the British Foreign Office. The trade is almost entirely in the hands of Armenians, who purchase for their own people in Baku and Tiflis, and occasionally send the wool direct to the agents in Marseilles. Agents of Polish manufacturers are, however, beginning to compete successfully with the Armenians. There is nothing to support the idea which is prevalent that the Central Asian railway is drawing all the Khorassan and Central Asian wools to Russia and denuding the English market. The railway has undoubtedly lowered the prices of Bokharan and Turkestan wools on the Caspian, and the Baku-Tiflis line has cheapened all Asiatic wools in the Black sea ports, but neither railway gives Russia an exclusive advantage. As regards Khorassan wool, the sheep are chiefly the property of the nomad tribes. There are two clips a year, and March and August are the buying months. Sabzewar is the center of the trade, and the permanent residence of the Armenians engaged in it. These make cash advances to the Persians, who visit all the villages at the shearing season and purchase the wool, which is then brought to Sabzewar, the Persians being allowed a commission of two per cent. At Sabzewar it is sorted and baled, and then forwarded, via Shahrud, to Bender-i-Gez for shipment across the Caspian. The bales weigh about 190 pounds each, and two form a camel-load. The actual price paid in October last in Sabzewar was about four pence per pound, and the quantity annually exported is about 14,000 or 15,000 bales. As to the possibility of securing Khorassan and Transcaucasian wools for the English markets, Mr. Law observes that they are both to be bought freely in Baku and Tiflis.

It is purely a question of price and of knowledge of the market, which is not gained without time and trouble. Probably Armenians or Parsees would have to be employed to make the first purchases from the producers. Mr. Law also points out that Khorassan wool might be transported southward and shipped from Bender Abbas, instead of from the Caspian. It can be delivered at Batoum for about six pence per cwt. less than at Bender Abbas, but there is no direct communication between Batoum and Great Britain, and British trade suffers severely in many ways from the want of it.

The Wool Industries.

Colonel Harney, President of the Manufacturers' Association, lately made a statement before the Senate Committee which seems a little contradictory. He says that some of the wools produced in Mendocino county are almost as fine as those produced in Australia, and that if the grade and breed could be maintained it would be possible eventually to rival Australia. But Colonel Harney added that it would most certainly benefit the people of the State and of the country generally if the higher grades were admitted free of duty.

Commenting on the above, a contemporary says: This is equivalent to saying that the production of the higher grades ought not to be encouraged in this State or elsewhere in this country. Certainly if the lower grades are required to pay a duty, as Harney advises, the admission of the higher grade free would tend to center production upon the lower grades. It is quite possible that it may be for the present interest of wool manufacturers to open our ports to free wool of the higher grade. As we do not at present produce the very finest grades, the duties paid on such grades add to the cost of the manufactured product. If it were an established fact that we could not produce the higher grades we might then admit them free of tax, on the principle that we now admit tea and coffee free. But Colonel Harney has testified to the superior quality of Mendocino wool and to the prospects that wool may be produced in that county equal to the best of Australian wool. Probably Mendocino county is not the only location in the State in which similar results may be attained. The question, then, is, should the production of the highest grades of wool be abandoned for the immediate benefit of wool manufacturers?

THE ONCE DESPISED COTTON SEED.—Was there ever, says the *Banker's Monthly*, such a history as that of the cotton seed? For 70 years despised as a nuisance and burned and dumped as garbage, then discovered to be the very food for which the soil was hungering, and reluctantly admitted to the rank of utilities, shortly afterward found to be nutritious food for beasts as well as for soil, and thereupon treated with something like respect. Once admitted to the circle of farm industries, it was found to hold 35 gallons of pure oil to the ton, worth in its crude state $14 to the ton, or $40,000,000 for the whole crop of seed. But then a system was devised for refining the oil up to a value of $1 a gallon, and the frugal Italians placed a cask of it at the root of every olive tree and then defied the Borean breath of the Alps. And then experience showed that the ton of cotton seed was a better fertilizer and a better stock food when robbed of its 35 gallons of oil than before, that the hulls of the seeds made the best of fuel for feeding the oil-mill engine, that the ashes of the hulls scooped from the engine's draught had the highest commercial value as potash, and that the "refuse" of the whole made the best and purest soap stock, to carry to the toilet the perfumes of Lubin or Colgate. In regard to the cotton-seed hulls, a still further important discovery has been made. An experimental paper-stock mill at St. Louis has demonstrated that the waste or refuse lint of mills that make cotton-seed oil is almost as valuable as the oil itself, this substance being convertible into paper. The receipts of the cotton-seed oil-mills, it is said, will be almost doubled from that source, while expenses will not be greatly increased.

COTTON MANUFACTURING AT THE SOUTH is compelling New England cotton manufacturers to go on to finer grades of goods, leaving the coarser grades to the mills of the South. Longer stapled cotton, largely of Egyptian growth, is coming more and more into demand, for which the combing machine is required. Not only this, but the fancy loom for gauze and other descriptions of weaving is meeting with an unusual demand; and where the witch motion can be applied it finds a ready reception in many of our best equipped and most progressive mills. Elegant cotton fabrics are being made in some of our New England mills, which are not infrequently placed upon the counter and sold in favorable competition with like goods of foreign manufacture. There is no good reason why our mills should not take up with the manufacture of finer fabrics, and pursue still more extensively the work already begun.

GAIN IN NEW ENGLAND SPINDLES.—The known and estimated gain in spindles in the New England States from Jan. 1, 1888, to June 30, 1890, in round numbers is 1,500,000; with a total spindle capacity of 10,500,000, the net gain for New England, including Massachusetts, should be a trifle over 14 per cent. For Massachusetts alone, 13½ per cent; for Middle States, 9 per cent; for Southern States, 60 per cent; for Western States and Territories, 13½ per cent; British America, 3 per cent.

WOOLEN-MILLS IN UTAH.—The new Deseret Woolen-Mills at Salt Lake City are ready to begin business. The manager says he expects to turn out 20,000 yards of cloth a month. The woolen-mills at Provo, Utah, have been enlarged to twice their former capacity. They will now be run every day in the year.

MEMPHIS is the greatest inland cotton market in the world, receiving from 700,000 to 1,000,000 bales yearly.

409,303.—POSTING GUIDE FOR BOOK-KEEPERS—H. H. Love, Sacramento, Cal.

409,476.—WRENCH AND OIL-CAN—J. H. Loso, Los Angeles, Cal.

409,493.—PAVING COMPOUND—Patterson & Groat, S. F.

409,335.—BALING PRESS—Jacob Price, San Leandro, Cal.

409,423.—FIREMAN'S MASK—T. E. Richet, Portland, Or.

409,536.—BRAKE FOR RAILWAYS—A. Watson, S. F.

409,342.—MACHINE FOR CUTTING OFF PILES—E. J. Weston, S. F.

409,541.—SMELTING FURNACE—J. J. Williams, S. F.

The following brief list by telegraph, for Aug. 28, will appear more complete on receipt of mail advices:

California—G. H. Bohrs, San Francisco, pilot or wheel guard for street cars; Howard W. Brown, Oakland, copying sheet; Lewis M. Clement, Oakland, and G. C. Watriss, San Francisco, cable or electric street railway; John Friss, near French Camp, bag-holder; John E. Furry, Stockton, fire-ladder; Albert J. Hart, San Francisco, thread-controlled stop-mechanism for sewing machine; William Kidd, Fishermans Bay, ox yoke; Herman Kohn, San Francisco, double-acting bellows; Thomas H. Melrose, San Francisco, speed-controlling device for elevators; Charles H. Ohm, San Francisco, safety guard for cars; Lester A. Pelton, Nevada City (assignee to A. P. Brayton Jr., San Francisco), water wheel; Charles B. Towle, Vallejo, school desk; George H. Wright, San Francisco, device for repressing cables at street crossings of cable roads.

NOTE.—Copies of U. S and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BALING PRESS.—Jacob Price, San Leandro. No. 409 335. Dated Aug. 20, 1889. This patent covers certain details in construction in the horizontal baling presses made by Mr. Price.

HORSE BLANKET.—John E. Foster, Ferndale, Humboldt Co. No. 409,352. Dated Aug. 20, 1889. The invention consists in novel straps, belts and bands for keeping the blanket in place. The object is to provide a simple and effective device for holding the blanket on the horse and dispensing with the surcingle commonly employed for this purpose.

TWO WHEELED VEHICLE.—Kasson A. Brigham, Gilroy. No. 409,346. Dated Aug. 20, 1889. The general object of this invention is to overcome the unpleasant horse motion which is a feature of this class of vehicles. The particular object is to provide a strong and effective shaft connection by which the desired result is obtained.

VEHICLE AXLE.—J. G. Kenyon, Port Kenyon, Humboldt Co. No. 409,362. Dated Aug. 20, 1889. This invention relates to that class of vehicles in which the wheels are attached to and rotate with independent axles. The invention consists in the novel means for attaching the wheel to the axle, the novel bearings for the opposing axles, the casing or box in which they are confined and details of construction. The object is to provide a suitable and practical construction in which each wheel, though secured to and rotating with its axle, shall have sufficient play to avoid great rigidity, and also to provide a simple and effective support for the independent axles from hub to hub.

POSTING OR COPYING GUIDE FOR BOOK-KEEPERS.—Harry H. Love, Sacramento. No. 409,363. Dated Aug. 20, 1889. This posting or copying guide consists of parallel opaque strips with transverse uniting bars and set-screws whereby the space between the strips may be regulated, and sliding guides upon the ends of the strips for holding them in proper relative position upon the book from which the copying is to be done. In posting from the journal or cash-book to the ledger, book-keepers experience some difficulty in preventing mistakes—such as reading the name from one portion of the line and the wrong amount in the column of figures—and in copying lists of names and in other similar work such mistakes are apt to be made by missing names or mistaking lines. This device is intended to prevent these errors.

Mining Personals.

J. R. Tregloan is superintendent of the South Spring Hill mine, Amador county.

A. P. Minear, manager of the Amador Con. M. Co, has been in the city this week.

W. Dodge is superintendent of the Baker Divide mine at Forest Hill, Placer county.

Robert Stevenson of Sierra county has bonded the Gardner or Paugh mine, near Clinton, Amador county.

Mr. Craig, a mining expert of Colorado, is at Silver City, Idaho, examining the Black Jack and Empire State mines.

Superintendent Comstock of the Silver King mine informed the Florence (A. T.) *Enterprise* that work in the mine has progressed satisfactorily.

Mr. Hopper, formerly at the Sierra Buttes mine, Sierra county, is now secretary of the Uncle Sam mine, Shasta county, belonging to the same company.

John Prout, who was for years shift boss of the Gould & Curry mine, on the Comstock, died at Freeland, Montana, last week. He was foreman of the Freeland mine.

W. H. Radford, the superintendent in charge at the North Bloomfield mine, has paid the $500 fine which was levied by Judge Keyser last March for illegal mining.

A. L. Walker, superintendent of the Old Dominion Copper Co., Globe, Arizona, is an amateur photographer, and has been making some good underground "flash-light" pictures.

Mr. Leak, who is connected with the Montpelier quartz mine, just above Downieville, Sierra county, has returned to his home in Chicago. Mr. J. Hughes has charge of the mine.

E. A. Shear has returned to Salt Lake from Pioche, where he went in company with Jos. S. Cook to repair and put in working order the shaft and pump in the old Raymond & Ely hoisting works.

D. D. Bailey, one of the pioneers of 1869, at Julian, San Diego county, has been elected recorder of Banner district, San Felipe canyon, a few miles from Julian. He is one of the owners of the Ready Relief mine.

Mr. L. Gross collected and arranged the fine exhibit of minerals and ores at the fair at Redding. The prize for the best class of ore on exhibition was given to the Gladstone M. Co., on Kline Gulch, in the French Gulch district, Shasta county.

James Sallee of the Iron Mountain (Shasta Co.) mine was in town this week to get a crank-pin for his engine, having broken one but without harm to the engine. He reports the mine very successful and their new roasting furnaces working to perfection.

A. H. Butler has returned to San Diego from Alamo, Lower California, with the papers in his pocket showing that six of the best mining claims at Alamo now belong to his company. These, he said to a reporter, were sifted out of the 22 original denouncements made.

D. B. Lyman, superintendent of the North End mines, has agreed to close the mines on Saturday, Sept. 7th, the day of the Miners' Union picnic. It will be a regular miners' holiday, as nearly all the men intend to go to Carson. It is likely that most of the other Comstock mines will also be closed on that day.

August Werner is superintending the building of the new smelter at Pioche. Mr. Werner of late years has taken out a number of letters patent on inventions made by him, several of which apply to smelters. The ball-valve tuyere nozzles and improved slag-pots to be used at the furnace at Pioche are patented by him.

The Phillipsburg (M. T.) *Mail* says Robert Beveridge, formerly foreman of the Hope mill, and J. J. Hayden departed yesterday morning for South America, where they will engage in mining. Their families also left during the week for Salt Lake and Butte, respectively, where they will remain until the gentlemen have arranged homes in that tropical country.

Mr. A. B. Paul, the well-known pioneer mining man of this State, is on a visit to the city, having come down from the Calumet mine, six miles above Redding, Shasta county. This company has a 24-stamp mill and is working 25 men, though more will be employed when there is more water at command. They have a five-ton mill for working gold-bearing ore by dry amalgamation. Mr. Paul says they have been very successful with the dry process and he will shortly give us an account of the results of the various tests. Paul pulverizing barrels are used and a very high percentage is obtained.

Capt. C. B. Dahlgren, who conducted mining operations in Battle Mountain and Pittsburg districts, Nev., for several years, is now engaged in mining on the Colorado river south of the Nevada line, and about 40 miles from The Needles, on the Atlantic & Pacific railroad. He has an immense lead, which averages about $14 per ton in gold, and works which reduce about 30 tons per day. The mill is situated on the Colorado river, and though the temperature seldom goes below 90°, the men have good health and there is very little sickness. He says it is not unusual to see a man prepare to go to sleep by dipping his blankets in the river, then spreading them on a bunk or mattress and lying down on them.

Coast Industrial Notes.

THERE are eight sawmills at Grays Harbor, Washington, that cut daily 490,000 feet of lumber.

AN important discovery of natural illuminating gas has been made on the farm of Captain Boyes near Sonoma.

SAYS the Reno *Gazette:* A log raft containing 750,000 feet of lumber was recently towed from Bijou, Lake Tahoe, to Glenbrook.

TULARE county redwood lumber is coming into demand at many points in the State, and lately several large orders for it have been received.

THE Union Pressed Brick and Terra-Cotta Works of Vallejo has already spent $30,000 on the works, and it will require a large sum yet to complete them.

THE salmon pack of the Columbia and Sacramento rivers has fallen off from somewhere in the neighborhood of 900,000 cases to but little more than 200,000 a year.

DUGAN & BLAIR have recently put a heavy set of rolls in their flouring-mill at Bishop Creek, Inyo county, rebuilt the wheel and overhauled the machinery generally.

THE citizens of St. Helena raised by cash subscriptions $2000 and presented it to Duckworth & Genung, whose machine-shops were recently destroyed by fire. The firm will rebuild and resume business.

THE story of the discovery of codfish banks off the coast of San Diego by the Albatross is discredited by experts. The cod banks near Cape Lookout, on the upper coast, are expected to prove very valuable.

THE Homer *Mining Index* has this industrial note: "Louis de Chambeau is making off-hand sketches with a long-handled shovel at the May Lundy dump, while several others are upholstering ore-sacks."

E. C. VOORHIES, president of the Amador County Committee, regarding the display of golden Amador's mineral and productive wealth at the State Fair, reports that a space 50x50 has been allowed in the Pavilion.

SINCE the Seattle fire 6000 tons of sandstone have arrived at that city from the four quarries at Chuchanut, on Bellingham bay, which are running at their full capacity, and granite is arriving by rail from Spokane Falls.

STEAM road-wagons have been put on the road to haul lumber from Sierra valley to Verdi. They weigh 20 tons each, and haul a load of 50,000 feet of lumber each trip. The distance is 16½ miles, the grade 500 feet to the mile, and a round trip is made in 12 hours.

THE Navy Department has readvertised for bids for the 2000-ton cruisers for which there were no successful bids when opened this week. The advertisement reduces the required speed to 17 knots per hour instead of 18, and adds six months to the length of time for their construction.

WITH 500 square miles of salt fields of unknown depth, and a whole mountain range of the purest rock-salt, says the Virginia City *Enterprise*, Nevada should be able to stand off the salt trust when it begins to cinch. Our State authorities should now offer a premium for the discovery of a sugar mine.

WORK at the Sonora foundry, Messrs. Romans & Cowie, has been quite active and orders for mining and other kinds of machinery have kept the foundry very busy. All the iron-work for the sulphuret works now building has been done at this foundry. An order has been given for ten additional stamps for the Mattison mill in Calaveras county.

F. C. MCNEIL tells the Reese River *Reveille* that the Chinamen are doing very well in their placer mining below Ione (Nev.) in the canyon, and that they are running a tunnel at present above the diggings to get more water. All the resident miners are greatly surprised over the success of the washing, and have wished many times since that they had dropped on to it.

G. N. FOLSOM has moved his camp from Incline, Lake Tahoe, to the Burk ranch, just over the mountain west of Genoa, Nev. It is the intention to cut 50,000,000 feet of logs, which will be towed to the Incline mills, and when sawed the lumber will be flumed down into Washoe valley. It will take several years to cut off the timber in the vicinity of the new camp.

DURING the past quarter of a century we have had little use for Eastern-made blinds, doors, or sash, for local factories have fully supplied the market, and there has been a surplus for export. The assessor reports 13 factories for the manufacture of these goods in this city. Nearly all of them are south of Market and east of Fifth streets. These factories employ 1400 to 1500 men and boys and cut up over 10,000,000 feet of lumber annually. The value of the manufactured product is estimated at $5,400,000 per annum. These are not the only factories of the kind in the State. There are others in the midst of the lumber districts in the interior. Some of these manufacture on a large scale.

THE Inyo *Register* says: The Big Pine sawmill is temporarily closed down. Wildasinn's mill, at Mineral Park, is running constantly and will cut nearly half a million feet of lumber before closing down. The Black Rock mill is also running, but will probably hang up soon. The Rock Creek mill has not fired up at all yet this season, but will make a short run this fall, probably.

JESSE SUTTON, superintendent of the transportation department of the Shasta Lumber Company, informs the Redding *Free Press* that the company is receiving 35,000 feet of lumber per day at its yard in Redding. Six 6 horse and two 8-horse teams are employed in hauling the timber from the dump to town. The company has 55 wagons, representing an investment alone of $10,000 or $12,000.

THE copper mine at San Pedro, N.M., has closed down and over 200 miners are thrown out of employment. The smelter, however, will continue to run. This action of the company is regarded by some as a blow at the camp on account of the recent rich strikes there, while others claim that the mine will pass into the hands of contractors and that in order to arrange the details a close-down was ordered.

FOR several weeks past large quantities of redwood railroad ties have been shipped east by the Southern Pacific Company for the Rio Grande Western. The ties are brought down from Mendocino county to Long wharf, and from there shipped in box cars to Ogden. The ties are for the Rio Grande Western—the newly incorporated Denver & Rio Grande Western, which line extends from Pueblo to Salt Lake City.

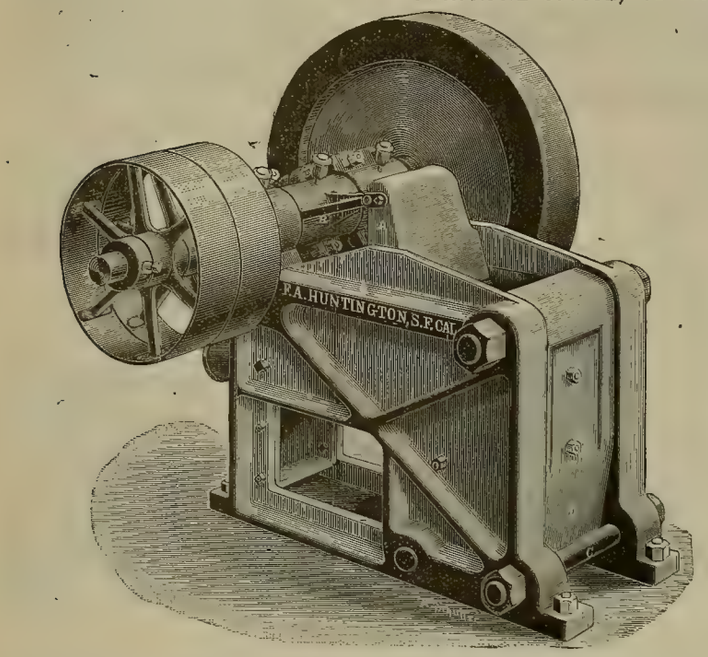
GREAT activity at present prevails among the lumbermen up in the Sierras. The mills are being run both day and night, and millions of feet of lumber are being piled up. The wood-cutters are also busy, and what escapes the sawmills goes into the woodpile. Lumbering will now be rushed day and night until the snows of winter begin to pile up in the mountains. Fires and the woodman's ax are fast denuding the "big ridge."

A LOCAL woolen-mill has completed a contract for 8000 blankets for the use of the inmates of the Soldiers' Home, near Dayton, O. This contract was let last April after a careful scrutiny of samples by the army officials, who met at Hartford, Conn., for the purpose of opening bids in accordance with advertisements. The bid of the local mills was four cents lower than the next lowest bid, and the contract was therefore awarded to the local works.

THE Inyo *Register* says that the Mono mills have temporarily suspended operations, though the Bodie & Benton R. R. still runs out lumber and wood trains from Bodie. The logging is now done by George Kinney of Round Valley. The mills manage to utilize pretty much all there is in the tree, as what is not available for lumber is cut into wood and used by the locomotives doing the logging or shipped into Bodie for use by the mills and hoisting works.

THE Victoria *Colonist* has printed a statement of the salmon pack of British Columbia to Aug. 17th, totaling 376,000 cases, being 127,000 cases above the largest pack of any previous year. Of this amount the northern canneries contribute 100,000 cases, the remainder being from Frazer river. It is estimated that the year's pack will reach 420,000 cases. This has all been sold at from $5.50 to $6.50, and calculating at $6 a case, makes the total value over $2,500,000. The Frazer river canneries have from 10,000 to 30,000 cans each.

THE planing-mill of John Rowell & Co. is nearly completed, and will supply the wants of Oroville and vicinity. The mill is 180 feet along the railroad track near the depot, by 100 feet back; 20 acres consists of lumber-yard. The mill is raised several feet from the ground, and its main shafting is underneath. The driving-power consists of an Atlas engine of 75-horse power, which is bolted down to a concrete foundation, and is even with the upper floor of the mill, while the two 12-foot boilers are 6 feet lower.

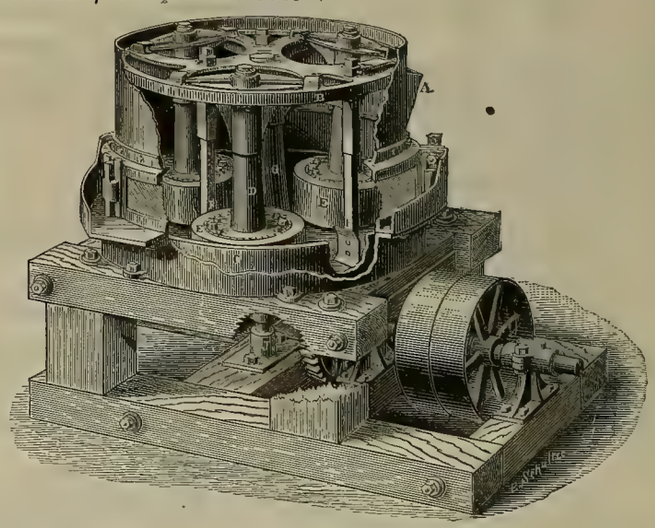


THE Virginia *Enterprise* gives a quaint account of a man who combines the occupation of millman and chiffonier at a place near the C. & C. dump: "There are 30 tons of rags, bottles, bones, pots, old iron and other metal nestled within the precincts of the stronghold—the accumulation of years. There is nothing that the Chinese or East Indian chiffoniers can pick up on the streets that Signor Guerrero will not buy. The mill adjoins and is part of the 'castle.' It is driven by an over-shot water-wheel, fed direct from the Taylor-street sewer. It has two 200 pound stamps and one pan, and can crush and amalgamate 500 pounds of ore in 24 hours. The Signor says his tailings are not worth saving, which compliment can hardly be paid to all other mills on the lode. Signor Guerrero built the mill himself, runs it and conducts the junk business besides."

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaptation of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

FREEMAN'S
Dry Process
GOLD SEPARATOR.

They are good machines. If the gold is in the dirt they will save it. They will save finer gold than water will.

T. J. SCOTT,
Osceola, Nevada.

Smith & Drew took out Tuesday, in their dry wash diggings, in addition to 5 ozs. of fine gold, a nugget weighing 22 ozs. The machine used was Freeman's Dry Process Separator.—*Utah Daily Union, May 10, 1889.*

Market Reports.

Local Markets.

SAN FRANCISCO, Aug. 29, 1889.

General trade the past week was fairly active for the season. Several distant buyers are sampling the market, while the near-by dealers will begin to come in soon. The Mechanics' Fair draws merchants from all parts of the State, who take advantage of it to lay in their stock of goods. The large grain harvest will do no little in relieving any stringency in the interior and restore confidence in the future. Although prices are now low, yet better values are looked for; even if this be not realized in the near future, the increased yield to the acre will do no little in offsetting the low prices. The improved outlook for the dried-fruit crop is a promising feature to prospective prosperity. Manufacturers have a fair business. Machine and iron-workers in general report more orders in hand.

The local money market continues easy, with only a fair inquiry for funds. As yet, farmers' requirements for crop purposes are mostly met by interior banks and capitalists. There is nothing in the market calculated to invite a speculative movement outside of wheat and barley. Those who have risked money in them on the bull side have not coined any too much, consequently they are shy in risking much cash on the long side," although it would seem that at present prices very little risk is run. In local securities, a deal appears to be under way in the powder stock, but whether those who buy at an advance can realize much profit, is, as yet, a problem. Other local securities are too high to invite operators to any great extent. Mining stocks have been quite active, so far as the Comstocks are concerned. An attempt is evidently being made to draw in new victims to bleed, on the old cry, after they are well in the meshes of big ore strikes. That the manipulators will be successful, there cannot be the slightest doubt, if the future is to be judged by the past.

MEXICAN DOLLARS—The market is quiet but firm at 74 to 74¼c from first hands, retailing over the counter at a slight advance. The last steamer leaving for Hongkong took out Mexican dollars valued at $154,304.

SILVER—The market has exhibited considerable strength the past week in sympathy with an improving market abroad. The output on this coast is below requirements, and to meet urgent wants, buyers are at times compelled to pay good prices. The last sale we have reported was at 93 1-10c per ounce fine. The asking rate on yesterday was 93¾c, but so far as obtainable, buyers were not disposed to bid, evidently waiting until toward the last before buying. The European market is reported dull, but very strong, with any buying of moment met by higher asking rates. The last steamer for Hongkong took out bullion valued at $163,000. Silver to-day is quoted by buyers at 93¾c.

QUICKSILVER—Receipts the past week aggregate 179 flasks. Shipments by sea were as follows: To Guaymas, 323 flasks; Ensenada, 25 flasks. The market with us is reported dull. The consumption on this coast is said to be light, but then the output of the mines is also light.

BORAX—Receipts the past week aggregate 614 ctls., and the exports by sea 24,952 lbs. to New York. The market is reported strong at full prices, under a good trade call from the East.

LIME—Receipts the past week aggregate 6379 bbls. The consumptive demand continues free, with a fair shipping inquiry reported.

TIN—Exports by sea the past week were as follows in plate: Victoria, 37,012 lbs.; Guaymas, 19,422 lbs. The spot market for both pig and plate favors buyers, owing to liberal supplies and buyers offish. For prompt shipment the market is very strong, which precludes, for the present, any business. Outward freights at supply ports are reported very strong.

IRON—Imports the past week aggregated 150 tons pig from Irondale. The local market is very strong, with indications of an advance. The consumption is gradually increasing, which naturally is reducing stocks, owing to the small imports. The quantity on the way is said to be light, while the high prices abroad for both pig and freight are against any business for the present. It looks as if prices here must advance soon.

COAL—Imports the past week aggregate as follows: Nanaimo, 3300 tons; Coos Bay, 475; Seattle, 3577; Port Townsend, 700: Australia, 2172; Departure Bay, 4300. Total, 14,524 tons. The market for both spot and to arrive is very strong. At the close $7.50 is asked for Australian for prompt shipment. Outward charters in Australian ports are advancing. As high as 16s is reported to have been paid the past week. Coast coals have a stronger tone with an advance not at all unlikely at an early day. The demand from consumers is reported to be increasing. The tonnage on the way from and on berth at Newcastle, N. S. W., and at Sydney for this port aggregates about 70,000 tons register.

COPPER—The local market is strong in sympathy with Eastern and European advices. It is very generally believed among usually well-informed parties that the output of the mines is to be reduced under a new arrangement between all parties in interest; yet, while claiming this so as to reduce the stocks more rapidly, they think that prices will not be advanced much, at least not enough to interfere with the consumption.

THE manufacturers of window glass, table glass and crockery have formed a trust.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Aug. 29, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 5-16	92½	$12 10	$3 90	$.0 30
Friday	42 5-16	92½	12 10	3 87½	20 30
Saturday	42 5-16	92½	12 10	3 90	20 30
Monday	42⅜	92½	12 00	3 87½	20 35
Tuesday	42 7-16	92⅜	12 00	3 85	20 50
Wednesday	42½	92½	12 00	3 85	20 50

NEW YORK, Aug. 28.—In copper a fair movement for use prevails. Lake, 12c; Western, 11c; casting brands, 10½c. Consumers seem more inclined to use Lake at 12c than before. Pig lead is in fair demand at 3⅞c. Refined borax is in moderate supply with a good demand ruling. Tin has been strengthening in sympathy with foreign markets.

Mining Share Market.

The Comstocks the past week were quite active, with Mexican and Union the leaders in the north end, and Yellow Jacket and Crown Point in the Gold Hills. Values gradually advanced up to Monday morning, when they began to weaken under bear points of quite a setback soon. These points many were inclined to believe, owing to Ophir, Con. Virginia and Confidence having done very little. Prices so far have failed to go off to the extent the bears had been led to believe, yet they have faith in their points ultimately being correct. The bulls, on the contrary, have points that stocks are going higher, and appear more than pleased that the market recovers so quickly after each shading off. But it makes very little difference how the average outside dealer operates; it is only a question of time when he retires a loser.

The market so far acts as if it was purely manipulation, for, so far as we can learn, there is nothing outside of promising work to justify either present prices or activity. Yet the market often goes the highest when there is nothing made public to warrant an advance. In the outside stocks the Quijotoas have been fairly dealt in and at strengthening prices. The Tuscaroras have lagged, as if the manipulators are taking in stock at declining prices. Eureka Con. made quite an upward move on more favorable advices from the mine. As the stock is better held, these moves can be made more advantageously. The Bodies did not go up with the Comstocks, but they set off when the latter did. Now that the price is down the air is full of assessment talk on Bodie, with still lower prices to obtain. Mono lost part of its assessment.

The market opened strong this (Thursday) morning at higher figures, with Mexican the leader. After the call the market was still active, with a slight shading in values. The state of the market indicates that lower figures may obtain before the pool can force the shorts to fill. Outside stocks are dull and heavy for the Bodies, which is due to a 50-cent assessment pending on Bodie. The Quijotoas were firm, but the Tuscaroras were weak.

It is the general opinion that if the Savage Mining Co.'s managers wish to vindicate themselves from the charges preferred by the president and secretary of the Mining Stock Association, they ought to bring a criminal suit against the parties and a libel suit against the *Chronicle* for publishing the accusation.

From the mines our advices report that the north drift from the west crosscut No. 1, on the 1500-foot level of the Mexican, is extended 260 feet, with improvements reported as the drift is run north toward the Union line. Belcher is upraising in low-grade ore from the 1200-foot level toward the 1100-foot level. The Ward shaft is now repaired and timbered to the 1600 foot. In Potosi the ore body mentioned in last week's paper is stripped for a distance of 50 feet. The rock is white, 36 feet wide, and reported as low grade. The west drift on the 500-foot level of Yellow Jacket, which is being run for the gold ledge, is now in very nearly 550 feet. The west crosscut from the 500-foot north drift from the Yellow Jacket shaft, run jointly by Challenge, Confidence and Con. Imperial, is in about of 150 feet in good formation of quartz and clay. From the Quijotoas the work going on is all of an important character. More men are to be put to work, while the mill, with its full complement of stamps, will start soon. From the Tuscaroras the usual reports come to hand, while from the Bodies we are unable to get any information outside of that heretofore published.

THE whaling tender Thomas Pope arrived in port Wednesday night from the Arctic. The captain made a report in which he stated that the ocean was very clear of ice as far as Cape Lisbourn, but to the eastward of it the ice was quite heavy. The following is the catch of the whaling fleet up to July 20th: Barks Reindeer, 3; Helen Mar, 1; Hunter, 1; Northern Light, 2; Lagoda, 1; James Allen, 1; schooner Rosario, 1; J. A. Howland, 1; steamers Belvidere, 2; Lucretia, 2; William Lewis, 1; Thrasher, 3; Narwhal, 4; Beluga, 2; Orca, 1; Balæna, 1; and Jesse Freeman, 1.

THE POWDER POOL.—It is said the Vulcan Powder Company was offered a subsidy of $25,000 a year to suspend operations for five years. The company would not accept the proposition. Now it is said the Powder Pool has leased the entire plant and business of the Vulcan Powder Company for five years, at an annual rent of $20,000, which is considered more favorable to the company than if it went out of business entirely for the five years.

THE NEW GOLD CERTIFICATES.—In accordance with the instructions recently issued by the United States Treasurer the Sub-Treasury in this city is prepared to issue gold certificates in denominations of $5000 and $10,000. These certificates are payable on demand at the Sub-Treasury, but only to order of the party to whom issued, and not merely on demand like all other denominations of currency.

A CONTRACT has been let by the War Department to the San Francisco Contracting Co., to build an iron wharf at Black Point, this city. Piles, flooring and everything will be iron. The experiment of having an iron wharf is owing to the wooden wharves at the Point having failed to stand any length of time.

W. L. SCOTT of Pennsylvania has telegraphed to his superintendent to discharge all the employes of the Spring Valley mine (Illinois) not absolutely needed, and prepare for a shut-down of six months or a year. The mines, he said, will not be opened again if they cannot be operated on a paying basis.

The Charleston's Trial.

The cruiser Charleston returned from her ocean trip on Monday morning, having succeeded in making 19½ knots. The official test commenced precisely at 10 o'clock, and at the close of the first quarter of an hour the engines were making 114 revolutions per minute. During the first hour the highest rate made by the engines was 118½ revolutions. The average revolutions of the engines during the first hour was 113 7-10, or nearly seven more than on her previous trial trip. Her rate of speed was 18 knots.

The Charleston was a little north of Monterey when the second trial commenced. During the first half hour's run the propellers made an average of 117 revolutions per minute. This average was maintained with a slight increase during the entire run, the engines at certain times making 120 revolutions per minute. The average revolutions of the engines during the afternoon run was 117 3-10. During this time the patent log recorded a speed of 18¼ knots per hour. Besides the record as indicated by the log, shore bearings were taken, and these showed that the Charleston was making an average speed of 19 3-10 knots per hour. The safety valve was blowing off all the time, indicating that the boilers were making more steam than the engines were able to use. The engines worked to the entire satisfaction of every one. Not a hitch was discovered anywhere. There was not at any time the slightest indication of heating of the engine slides, which caused the trial run last May to be a failure. The average horse-power developed was 6700; the vacuum was never below 26.

The vessel will now go to Mare Island to receive her equipment. The results of the official tests were very satisfactory, and no other will be made unless the builders desire to show a higher horse-power than was developed.

THE Atlas Iron Works are branching out and will have a new foundry in South San Francisco near the rolling-mills. The main building will be of corrugated iron and fitted within with all modern improvements in machinery. The entire structure will cover nearly a block square. The water at that point is very deep, and will permit the docking of the largest steamer at the wharf of the works. A railroad track is to be run in from the land side. Two traveling cranes are to be rigged up, so that a heavy boiler or a large piece of machinery can be handled easily, and can be placed on a vessel or car with comparatively little expense. Two cupolas will also be constructed. In speaking of the new works Mr. Jardine said that the company did not propose to confine itself to shipbuilding. "A considerable portion of the plant in the present works," said he, "will be used in the new building, and I shall still keep a portion of my present shop. I have great confidence in the ship-building interests of California, and I think she has a glorious future before her in that line. The steamers which have been turned out in San Francisco have proved most successful, and the industry is growing. No less than 20 steam schooners were built for Alaska alone last year, and as that country opens up more will be needed, to say nothing of our own coast and that of Mexico and Central America."

DECADENCE OF A MINING CAMP.—A gentleman who was lately in Tuscarora informs a Virginia City *Enterprise* reporter that the town is being deserted by the miners. They are leaving on horseback, muleback, wagons, buckboards, stages and on foot. The weather being pleasant, they need no more for a traveling outfit than a pair of blankets, some crackers and cheese, a plug of tobacco and a bottle of Tuscarora elixir. The Commonwealth mine closed down a few days ago, throwing 200 men out of employment in its mill and mine. A month ago there were 400 miners employed in the mines of Tuscarora, and to day there are not 75. Sunday 25 men left the camp on horseback for the Idaho country, seven left in a private conveyance, two stages were loaded down to the guards and a number "hoofed" it out of town.

LOW-GRADE TAILINGS. — Six mile canyon blanket-sluicers, who have no pans to amalgamate the sulphurets saved from tailings, are not making miners' wages and several of them have suspended operations. This is due to the low percentage of metal left in tailings flowing from the California panmill since the adoption of the Boss & Rae amalgamating processes, through which nearly 90 per cent of the assay value of ore pulp is saved—nearly 20 per cent above the average of ten years ago.—*Virginia Chronicle.*

NEVADA BULLION.—Of the $520,338,579 produced by the mines of the State of Nevada, $159,150,487 was in gold and $361,188,092 in silver. The gold is over 30 per cent of the gross yield. Of the total amount it is estimated that $326,804,600 has come out of the Comstock lode. Eureka district produced altogether $57,558,459, of which $10,070,000 was lead and the balance gold and silver.

THIS year's yield of the Broken Hill Proprietary Company's mines at Broken Hill, New South Wales, is estimated at $5,000,000 in silver bullion. These mines are under the superintendency of W. H. Patton, formerly in charge of the North-end Comstocks.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds $40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 26 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications intrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy-combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

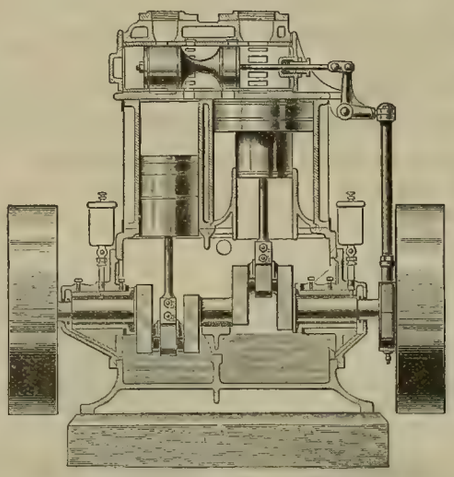
Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Ag... FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.



PARKE & LACY COMPANY

IMPORTERS AND MANUFACTURERS OF

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,
AIR COMPRESSORS, ROCK DRILLS,
WALL'S CRUSHING ROLLS,
CONCENTRATORS, PULVERIZERS,
TURBINE WATER WHEELS,
ROCK BREAKERS, DRY JIGS

Golden Gate Concentrators,
GREATEST CAPACITY
OF ANY CONCENTRATOR MADE,
One Machine Taking Pulp from 10 Stamps.

SAW MILLS, MACHINE TOOLS,
PLANING MILLS, INJECTORS and EJECTORS,
BELTING, PACKING, OILS, LUBRICATORS,
FIRE EXTINGUISHERS,
CENTRIFUGAL PUMPS,
ROTARY PUMPS, GANG EDGERS,
CAMPBELL'S STEAM FEEDS,
MILL and MINE SUPPLIES.

GENERAL AGENTS FOR

WESTINGHOUSE AUTOMATIC ENGINES.

SALES DURING LAST FOUR MONTHS:

COMPOUND, 44 ENGINES, 5215 HORSE POWER. STANDARD, 99 ENGINES, 4500 HORSE POWER. JUNIOR, 166 ENGINES, 4260 HORSE POWER.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W.

PACIFIC IRON WORKS

1850. 1888.

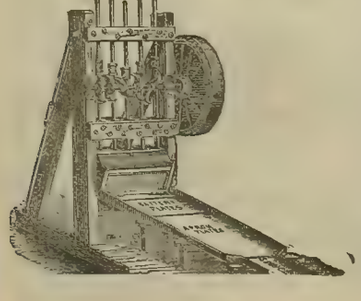
BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts.

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

METHOD OF WORKING NO. 5 SEAM.

SKETCHES SHOWING METHOD OF WORKING TONG COLLIERY, CHINA.

Working a Chinese Coal Mine.

In last week's PRESS we gave a map of the Kaiping coal-field, North China, and a sectional view of the Tong collieries. In this issue we give some engravings showing the method of working the mines.

As soon as the shaft reached its required depth a crosscut was driven north to cut all the coal seams, and when any seam, as, for instance, *A*, was reached (No. 5 seam, Fig. 5), it was followed along the strike east and west. In studying Fig. 5 it should be borne in mind that the heavy black lines indicate the drifts or gangways, not necessarily the coal. Thus it will be seen that by reason of faults throwing the seams, the gangway which is at the main stone-drift, in No. 5 seam, is found at one end in No. 7 and at the other in No. 3.

After extending these levels on each side of the crosscut a distance of 50 feet, winzes *R'*, *R* (Fig. 6) were driven up to No. 1 level for ventilation. These winzes at a distance of 20 feet above No. 2 level are connected by a ventilation cross-head. As the drifts advance, winzes are thus driven up at intervals of 50 feet. When three of them have been driven to No. 1 level a stall can be worked at once. *R'*, *R'* are stone shutes, and *R''* is the ladder shaft and coal shute.

The details of working a stall are as follows: (Fig. 10, page 189.) Coal-boxes 2 feet square by 8 feet long are put up from the bottom or No. 2 level to the ventilation cross-head for sending coal out of the stall, and ladders 12 feet long are put in to communicate with No. 1 level. Bridge rails of 14 pounds per yard are then laid from the ladder shaft to the stone shute.

In mining the coal the miners begin at the stone shutes and work to the ladder shaft. Round props of 6-inch pine, 4 feet apart, are put up close to the coal as the cutting face advances. The empty space left by cutting away

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

A Californian at the Paris Exposition.

MESSRS. EDITORS:—We left London July 10th at 10 A. M., via Folkstone and Boulogne, and arrived in Paris at 6 P. M. We put up at the private hotel, 20 Rue d'Antin, Avenue de l'Opera.

The transition is so great for such a short space of time that I hardly know whether I am in dreamland or had the nightmare. So few people speak the English language that we find it hard to get along sometimes. We have to use pantomime, pigeon English and bad French. In the banks and large business houses they have men or women who speak English. It is almost impossible to find a policeman or cabman who can speak English. All of them understand Exposition, and when we want to return home we show a card of the hotel and street. This city is entirely different from anything we have seen yet. There is a greater uniformity in construction of buildings and material. Block after block is built the same hight and with same finish.

The Boulevards are Wide,

With a row of trees on each side, and sometimes from one to four rows through the center of the street. The streets are nicely paved with stone, wood or concrete, and are swept every night by horse-power. Carts are kept on the move to carry off the filth that is collected by machine sweeping and by the women with long brush brooms. Some of the pavements are from 20 to 30 feet wide, and are occupied in front of a saloon by chairs and small tables by those who wish to rest and chat and drink a glass of wine or beer and munch some dry bread and do a large amount of talking.

There are a great many strangers in Paris and times are very lively. A large amount of money will be left in this city by the tourists, who seem to have plenty of it. A person can spend a lot of money here, or he can get along very reasonably for an Exposition year. The cabmen had a strike awhile ago and charged exorbitant prices, but their charges are in the bounds of reason now.

A cabby brought four of us home from the Exposition the other night and charged us three francs (60 cents) for a distance of at least 2½ miles. There are only a

Few Horse-Cars Here,

And they do not run very near our stopping-place. They charge about three cents for a ride. The Seine is full of passenger steamboats, which only charge two cents, but still we have to walk three-fourths of a mile. Most of the conveyances are one-horse and one-seated cabs, with four wheels. There is the regular public bus, with double or upper deck, and plenty, as it would seem, of conveyances got up especially for the occasion.

After 9 o'clock it is hard to get on to a bus, unless you stop at a station and get a ticket with a number on, and then each one must take his turn according to number. The horses have been worked so hard since the opening of the Exposition that they are almost lifeless, and it takes considerable of the cracking of the whip, which a Frenchman is noted for, to keep them on the move. I predict that half of the horses which live to see the end of the Exposition will be worthless.

Most of the horses that work in the buses, street cars, and heavy carts are the gray Normandy or Percherons. They have not as good horses here and they do not take as good care of them as they do in London and Scotland. Have not seen a light carriage or buggy on the streets.

A Magnificent Exposition.

I went to our Centennial in 1876, to our Cotton Exposition at Atlanta, Ga., the Cotton Exposition in New Orleans, and I say, if all were put together they would not come up to this. I said when I examined our Centennial I should not live to see its equal. If I can govern myself I will not make such an extravagant prediction again. It would seem that it would take the combined world to surpass this. I cannot comprehend the mind that has the genius to conceive this, or the daring audacity to successfully carry it to completion. It seems for adaptability and tact and for means to carry out, the Frenchman has no superior. I met a minister in London from Oben, Scotland, who had just returned from Paris, where he had been on his wedding tour, and he said the Exposition and the Eiffel tower did not come up to his expectation. I was quite disappointed at his report. I forgive him now, for I know when I was on my wedding trip I thought Lake Erie a millpond and Niagara the water pouring over the dam. He said Paris was such a gay city and its citizens so full of pleasure that they had no time to think of death or prepare themselves for the other world.

At Philadelphia and New Orleans there was plenty of ground room, and the exhibition was contained in a few large buildings. Here the ground room is scarce, or a good deal cut up, and the exhibition has to be in a good many small buildings, outside of the one main building. There must be some first-class organizers here in order to get up the buildings as nicely and tastefully as they have and classify the exhibits. I have tramped and tramped and tramped, and the more I see the more bewildered I become.

The U. S. Exhibits.

The United States, as far as I have seen, have three very creditable exhibits: One in the art department, one of machinery, and the other, for want of a better name, call it useful arts, and still another in that indispensable household help, the sewing machine.

I think the machine department the most complete ever got together. They have motors of all kinds—air, gas, steam, electricity, water and sundry ones beyond my comprehension.

The drawings, maps and models of the civil engineering department seem exhaustive.

I have not seen one-half of the art gallery yet, but I have seen enough to cover a ten-acre farm. One picture, "The Crowning of Josephine by Napoleon," 20x30 feet in size, would take a person well up in art and history several hours to fully appreciate and comprehend.

Here is a grand school to study art. The student need go no further; nothing is forgotten or left out. The creation of genius, or the copy of nature, has had its full sway. I wish I had the gift of language to describe some of the fairy statuary pieces with the fountains in full force. I do not like to describe so beautiful and fairy-like scene with imperfect language. They use water with a lavish hand but with beautiful effect. I have attended the fair five times, and to-day I went over acres of ground that I had not visited before.

The Oriental Exhibits.

I thought the natives of Eastern and Oriental countries were located near the River Seine, but I see I am mistaken and have not seen half of them. They are assigned a piece of ground running back at right angles from the river, I know not how far.

Here is the grandest opportunity to study, as it would appear, all nations of the earth, their modes of living, dressing, habits of industry and mechanism, animals, architecture, and food and manner of preparation.

Each nation has brought its hut, cave, tent, house or habitation with it. They have brought their primitive wooden looms with them for weaving different fabrics, their agricultural and mechanical tools, their boats and fishing tackle, their bamboo and split bamboo houses, their needles and knitting apparatus, paint brush, pot and tools, and are at work laying Mosaic pieces. They have their large and long-horned cattle from India, their two beautiful gray mares with their foals from Arabia. Hundreds of trinkets that they make are offered for sale.

A Chance Acquaintance.

I was passing by one of their booths, or huts, when a big, fine-looking fellow came up to me and said, in good English, "How do you do?" and grasped my hand and gave me a good shake. He said: "I am a Yankee as well as you," and ordered his assistant to draw two glasses of pineapple water, which was well appreciated, I being a little warm. I asked him where he had learned to speak English so well. He said he had been six years in the American navy. I offered to pay him for the drinks, but he would not accept. He felt it a privilege to treat a Yankee. We shook hands, and I said: "I will see you again."

Some were regular negroes, with short, curly hair, from Algiers, some from the Congo, Turks, Egyptians, and one race looked like the Chinese, but did not shave their heads. They wore a sort of turban. Natives from Soudan were there, and showed two massive logwood or mahogany doors that had been used in their forts and had been pierced by cannon-balls, evidently by their enemies. One nation had its cart drawn by natives. It consisted of massive wheels, bamboo or wicker-box and top, with hard-wood pole running through the hubs far enough to fasten into a frame outside the wheels that supported the box or body. There was no iron tire in the wheels and the felloes were kept together by a rabbet running from the middle of the outer circumference of the wheel toward the hub. It was a very Babylon of voices and nations. The directors have built a great many fancy and extravagant-shaped houses for these foreigners to vend their wares in.

The Eiffel Tower

Is the masterpiece of the Exposition. It appears at all of these great Expositions they have some leading feature. At the Centennial it was a bell with a crack in it, at New Orleans a tiny bale of cotton, at Paris the Eiffel tower is stamped on most everything, and at my breakfast, if I find the Light Brahma has not stamped the Eiffel tower on her shell, it is a good cause for pronouncing it overripe.

Three of us estimated yesterday that the foundations on which the four legs or supports of the tower stand cover an area of nearly two acres. The arches, platforms, the circular tapering, the finish at the top, and the maze of bracing are fine specimens of mechanical skill and cause much wonderment. There are three different lifts or elevators, or in other terms, you have to use three different ones before arriving at the top.

When I look through a little piece of glass about the size of a small bird's eye, inserted in the pen-holder that I am writing with, I find quite a description of the tower. It says it is 300 meters high, a little less than 1000 feet. A meter is three feet three inches and six-tenths, or about 39⅓ inches. All five of us started to go to the top, but on account of there being such a crowd we only went up to the second lift, and will go up to the top some day when there is not such a crowd present.

At the first platform it seemed like a small village. There are restaurants, drinking saloons and booths where small articles are sold. The second lift presents one of the finest of views of Paris and the surrounding country. It seems more like a painted city than one of reality. I should have said before that there were four lifts from the ground to first platform, and two from first to second, and one from second to top, and a continuous stream of people going up and coming down. Every one who goes to Paris wants to ascend the tower. Eiffel has a lease of the ground for 20 years, and then it belongs to the city.

Paris, July 18th. DANIEL FLINT.

A Bad Mining Law.

Comments on the Stewart Bill.

EDITORS PRESS:—While Mr. Stewart is doing much in the interest of the mining fraternity, we cannot indorse all of his aims as set forth in the PRESS of Aug. 10, 1889.

There is no law in existence that so retards the development of the mining resources of the country as that which compels an honest prospector to do the representing of worthless co-owners in order to prevent the forfeiture of his own rights. It is a poor law that compels a man to labor in the interest of one who will not labor for himself.

For instance, when James Faithful, Pete Dolittle, and Bill Bilk became co-owners in a mining claim, Bill Bilk congratulated himself that James Faithful is not only hopeful of success, but a hard worker besides.

So he said to himself: "I'll just let my co-owners perform the assessment work, and if the vein proves to be worthless they may advertise me out and take it for their pains; but if they make a lucky strike I'll then have no difficulty in rustling up the 'stuff' to pay my portion, and claim my share of the ore as well as to retain my interest in the bonanza."

As to Pete Dolittle, he intends to help develop the claim, but would a good deal rather hang around the saloons to play cards and drink rotgut; and when he does attempt to perform a little work don't know how to go about it; hence, after a few vain efforts at something that worries him a little he starts off in ill humor, curses his luck, and gets on another spree.

Now James Faithful, who, if sole owner, or with agreeable co owners, would have worked zealously to develop the claim, under present circumstances, rather than be the slave of worthless co-owners, reluctantly abandons the claim, which is subsequently jumped by Jack Sharp, who is a gambler by profession, and never prospected an hour in his life, but is always on the lookout to speculate on the labor of others.

The important question now is, "Why did Jack Sharp have a better right to relocate that claim than James Faithful?" I say most emphatically—when a co-owner does the full representing of a mining claim, he is more justly entitled to all of it than a stranger would be were all the co-owners to abandon it. The stranger does not have to advertise. And a man should not be put to unreasonable expense to advertise his co-owners for *any* length of time.

Let him post a notice of relocation on the claim in a conspicuous place and have said notice recorded within a reasonable time, and if any co-owner acts unjustly in this, let him be prosecuted for attempting to receive value under false pretense, or on some other charge as the law may prescribe.

The above illustration does not show all the evil effects. Presuming that James Faithful concludes to perform all the assessment and acquire title to all the claim by advertising out his co-owners, he will cease development just as soon as the limit prescribed by law is performed. Moreover, he may do "deadwork" rather than to expose any body of ore that he is led to believe exists on the claim.

Thus year after year rolls by, leaving the country undeveloped, and no one but a prospector can know what a curse such law is. Regarding the relocating of a claim we do not consider it just to prevent any prospector from relocating a claim which he formerly occupied.

He may have spent years of privation and hardship, and finally through force of circumstances aided by discouragement, he abandons the claim and returns in subsequent years to find it had been located and abandoned in the intervening time by other parties; and now when greater experience and more means would enable him to develop it, the law prevents his action, thus forcing the ground to lie idle indefinitely and preventing an honest prospector from reaping the rewards of his early labor.

Or, in another case, the former occupant returns to find a portion of the claim occupied. He does not dare to relocate to adjust his lines to the present situation, so it is left unoccupied or falls into the hands of others.

A law that we should have is, one to require $100 worth of improvements to be made for the first year where the location is made on an old discovery of which the locators were not the original discoverers, excepting such locations as shall be made within 90 days of the expiration of the representing year.

This would prevent Dolittles and Sharps from locating and holding old discoveries for speculation, trusting to the labor of others to open up the district and enhance the value of undeveloped claims.

A Montana law, which says that "the relocating of a mining claim by its occupants does not exempt the same from the annual expenditure, but such must be performed just the same as if it had not been relocated," fills all requirements to prevent fraud in cases where prospectors jump their own claims to avoid doing the assessment work.

My quotation may not be accurate, but the reader will understand the meaning, and bear in mind that the writer is a prospector, not a lawyer.

Hoping that the honorable gentleman from Nevada, as well as Mr. Carter from our own Territory, may see and act on these suggestions, we promise them a prospector's sincerest thanks.

Glendale, Montana. HENRY W. BROWN.

THE MINERAL PALACE.—A dispatch from Pueblo says the decisive meeting of the mineral palace enterprise was held, and the North Side and South Side got to bucking against each other, with the result that over $200,000 was subscribed by both together. The North Side, however, offered total subscription of $110,000 and captured the prize. It will be located in the northern suburbs. The capital stock was increased to $150,000 and about half the increase was at once subscribed for. The architect's plans have been accepted and show that it will be a magnificent creation, far excelling in richness and splendor any of the "palace" novelties yet presented to the public. The building will be in Egyptian style, in three great domes surrounded by an open colonnade. The pillars and columns will be respectively of stone and silver ores representing every quarry and mine in Colorado, and the domes will be lined with polished metal.

THE FORTY-NINERS.—The Society of California Pioneers of New England will revisit the scenes of their labors next spring. From a prospectus issued by Wm. H. Thomas, the president of the society, it is learned that they will leave Boston on a special train April 4, 1890. They will come by the Santa Fe and A. P. roads and make a few days' stay at the cities of Southern California. From thence they will journey to Sacramento and remain for three days, giving all a chance to visit their old mining camps. The circular says that here they will "probably have an evening reception at the State House by the Governor, if he is not absent from the city." Then they will go to San Francisco and San Jose and back to Sacramento, whence they will go East by the Central Pacific and the Denver & Rio Grande roads.

THREE expert miners, J. M. Owens, Thomas Owens and William Ellis, have been purchasing machinery and implements for use in opening a fine slate quarry in Calaveras county. The quarry is situated about three miles southeast of Copperopolis and is distant 12 miles from Milton, the nearest railroad shipping-point. The stone is fine-grained, dark blue in color and can be split to any desired thickness. Slabs can be cut out in any size and split to order. The owners of the quarry claim that their slate is the best ever discovered in California, far excelling the roofing slate now being taken out in El Dorado county. The miners say they have a large ledge of fine-grain stone which will make first-class pencil-slates for use in schools.

THE new Howard-street line of cable cars is a part of the Omnibus Railroad Company's system and runs from Twenty-sixth to the ferries. At Tenth and Howard streets a cable branch runs along Tenth, across Market into Fell, to Franklin, to Oak, to Stanyan, to Waller, passing the Haight-street Base-ball grounds. Another branch begins at Post and Montgomery and finds its way out to Waller. A horse-car line will connect between the ferries and Post street. Still another cable branch will begin on Leavenworth and Ellis and will run south on Leavenworth to McAllister, passing in front of the new City Hall and connecting at Polk and Fell streets with the cable from Tenth and Howard to the park.

THE ADELAIDE COPPER MINE.—The work of developing the 100-foot level on the Adelaide copper mine is being rapidly pushed, and with very satisfactory results. The drift south is in 35 feet, and shows good ore all the way. An assay from some soft decomposed sulphurets in the face ran 22 per cent copper and 18 ounces silver. The crosscut west is in 36 feet and still in ore. A drift from this crosscut has been started north along the vein and a crosscut will soon be started east toward the hanging-wall. Work on the shaft will be resumed, and it will be sunk another hundred feet when the 200-foot level will be opened up.—*Winnemucca Silver State.*

FOR THE ADVANCEMENT OF ASTRONOMY.—Among the newly incorporated enterprises is the Astronomical Society of the Pacific, which has for its objects the study and advancement of the science of astronomy and the fitting out of expeditions for the purpose of observing astronomical phenomena in the United States or in foreign countries. There is no capital stock. The directors are: Edward S. Holden, E. J. Molera, Chas. Burckhalter, J. M. Shaeberle, Wm. Alvord, W. H. Sowden, W. C. Gibbs, Wm. M. Pierson, Wm. Bœricke, Frank Soule, Jr., and C. Mitchell Grant.

Town-Sites and Auriferous Lands.

In December last L. E P. Lachlan applied to the Federal Land Office in this city (says the Sacramento *Record Union*) for a mineral entry on certain tracts of land in El Dorado county. The application was rejected by Register Hetzel on the following grounds:

First—The conflict of a portion of the tract sought to be entered with the grant to the Central Pacific Railroad Company.

Second—On the ground of conflict of other portions of the tract with mineral patents already issued by the Government.

Third—On the ground of conflict with patents issued by the Government, under the town-site law, to the inhabitants of the town of Greenwood, El Dorado county, on Feb. 3, 1874.

Mineral Claim or Town-Site.

The Register held that the first two grounds of conflict are local and not of general interest. The Commissioner of the General Land Office has sustained the Register in his rejection of the application upon each and every ground, but with reference to the third ground has instructed the local office that, if so demanded by the mineral applicant, a hearing must be ordered to determine whether or not this particular mineral claim was known to exist prior to its occupancy or improvement for residence or business purposes under the town-site title.

The General Land Office further holds that if it be proven after a hearing that the land in conflict was known to be valuable for mineral purposes at or prior to the inception of the town-site entry, or prior to its occupancy and improvement for residence or business purposes under the town-site title, the General Land Office will recommend the Secretary of the Interior that suit be instituted in the name of the United States to declare that portion of the town-site patent proven to have been known to be valuable for mineral purposes void and of no effect. The Commissioner, in his decision, refers to a decision rendered by the Secretary of the Interior on July 9th last, in the case of the Government against Laney.

The Effect of This Decision,

Under certain possible contingencies that may arise, would seem to be very far-reaching and full of importance to towns in the mining sections, many of which are built on ground that in early days was covered by mining claims, and which ground is still known to be valuable for mining purposes. The result of the contest in the Greenwood case will be watched with great interest, as the character of the evidence that will be taken at the hearing ordered by the General Land Office will determine the extent of the danger that threatens other towns located under similar conditions to those of Greenwood.

The Nevada *Herald* predicts a hard winter because the wild geese are herding to the south in great numbers.

Patents and Progress.

Changes Wrought by Inventors.

One need not be very old to have a distinct recollection of his daily life, its conditions and environments, 50 years ago, when the patent system of the United States was in its early infancy. Then the country was almost entirely agricultural, for our grand career in manufactures and the industrial arts was just beginning. It virtually began with the patent system—the creation of the Patent Office—and it has actually kept pace with the development of that system, so that this magnificent progress stands as the indisputable result of the system. In other words, we owe our splendid achievements in manufactures and the arts to the stimulus that the patent laws have given to invention.

Fifty years ago most of the people of the United States were clothed from the products of the domestic spinning-wheel and hand-loom. The itinerant shoemaker went from house to house, setting up his bench and plying his vocation in the farmers' kitchens. There were no planing-mills; no shops for the manufacture of doors, sashes and blinds. All the work of the builder, including carpenters' and joiners' work, was done by hand. The carpenter, if a good one, got a dollar a day. Coal was consumed but by few families even in the large cities, and by nobody in the smaller towns. The tailors, like the shoemakers, came to the house and made into clothing the cloth woven by the mother and daughters, with a little help from the fulling-mill that was generally near the grist-mill of the neighborhood. The railroad and the telegraph had not yet added their powers to the forces of civilization. This year, 1889, is no more like 1839 than the hand-loom is like a cotton factory. "Better 50 years of Europe than a cycle of Cathay." Better one year of the life that is lived under the new conditions than any number of years of the hard existence that was drudged out under the old conditions. It is only the hopelessly pessimistic soul, and the constitutional and incurable grumbler, who does not recognize the blessings that have come with the march of invention. For all those, let it be borne in mind, we are indebted to the system that has fostered invention, and secured to inventors the right to enjoy the products of their own brains and hands. —*Inventive Age.*

What the miners of the United States want is a square location law with plain statements. Give us a law which shall plainly define a miner's rights, confine him to his side lines and end lines and avoid litigation.—*Los Angeles Miner and Artisan.*

Engineer John Heath has been in the service of the Northwestern railroad nearly 30 years, during which time he made 93,658 miles as fireman and 905,117 miles as engineer without an accident. It is a notable record.

The Hensley group of copper mines at Washington Camp, Pima county, Arizona, has been sold to the Westinghouse Manufacturing Company of Pittsburg, Pennsylvania. They have been bought, not for speculation, but to produce copper to be used in the manufacture of engines and other machinery. The price at which the mines are sold is said to be $100,000. The several claims are being patented and extensive works are to be erected to reduce the ore.

A telegram has been received at San Diego from the officers of the San Diego Land and Town Co., in Boston, owners of the Sweetwater dam, directing the floodgates to be opened, and to let 5,000,000,000 gallons of water run to waste in the bay. The object of this order is to remove the water from the lands of Neale and others, who recently secured a verdict in the Superior Court of that county, awarding them $122,675 damages for about 350 acres of land covered by water behind the dam. The company claims that the award was excessive, and rather than pay it, will restore the land to its former condition.

At Klamath City, says the Yreka *Journal*, the Klamath River Lumber and Improvement Co. employes have made great progress lately in the construction of their mill, the frame of which is now nearly completed, and the machinery is now being shipped at the East. They have also erected six new houses on the principal business avenue of the new town, called Commercial street. There are about 600,000 feet of lumber now on the ground, for construction of the company's buildings, with 400,000 more to arrive as fast as the Sisson Lumber Co. can fill the order, and it is expected the extensive mill will be in operation by the 1st of December next.

The sash, door, blind and molding mills of the interior of California send some of their product to San Francisco. In some cases this comprises a large proportion. The remainder goes into the immediate neighborhood of the mill. This is especially the case where the mills are located in the large interior cities and towns. The San Francisco mills sell most of their product for home consumption, and much of it is consumed in this city. They also supply interior points from San Diego to Siskiyou. Shipments are also made inland to points outside of State boundaries. There is also some export trade with foreign countries. Australia is probably the best country in this line. Last year over 34,000 doors were sent hence to the colonies of a value of $59,800. There were also door stock and moldings for the same market to the value of about $20,000. Mexico takes about 10 per cent of what Australia buys in this line here. The various islands of the Pacific are customers of the same kind, but on greatly reduced lines. But it is upon domestic rather than foreign consumers that our manufacturers rely for custom and an extension of their business. Fortunately the home field is steadily enlarging. From a few hundred buildings per annum, San Francisco alone is now erecting upward of a thousand, and every building furnishes a demand for doors, sashes, blinds, etc.

San Buenaventura.

San Buenaventura, the county seat of Ventura county, is one of those pleasantly located southern towns which is profiting by the impulse imparted to them by railroad connection, increase of population and the enhancement of real estate values. Like all of the old California Mission towns, the beauty of its location, the salubrity of its climate, and the agricultural resources of the surrounding country were the natural inducements which tempted the shrewd old Padres to establish a station here. Like some others of these old Missions, also, these natural advantages were allowed to slumber for nearly a century before they were availed of by the new and more energetic race which has come in and possessed the land.

It is now a thriving city of thirty-five hundred people, with wide, shady streets and avenues, laid off at right angles, with public and private schools, churches of all denominations, daily and weekly newspapers, free library and reading-room, large and convenient hotels, stores where every description of merchandise can be procured, and all the accessories of a thriving, well-furnished California town.

A PARTIAL VIEW OF SAN BUENAVENTURA, CAL.—A CITY BY THE SEA.

The town is built at the mouth of and on the east bank of the Ventura river, is on the coast line of the Southern Pacific railroad, about 65 miles northeast from Los Angeles, and about 25 miles southeast from Santa Barbara, and being situate on the coast, with tolerably deep-water facilities, enjoys the advantages of competition between railroad and marine transportation. In addition to all this, San Buenaventura has a large and fertile back country tributary to it, and being thus happily located, is secure in present prosperity and future success.

A New four-masted schooner built by Hall Bros. at Port Blakely is called the Golden Shore. She is owned by J. J. Smith and others. She is 178 feet on the keel and 200 feet in length over all, 38.6 feet beam and 14.2 feet in depth of hold, and is the largest vessel ever built by Hall Brothers. Her masts are each 100 feet high, being 89 feet above the deck; the top masts are 60 feet higher. Her booms are 39½ feet long, and the gaffs are 38 feet long. The Golden Shore has a carrying capacity of 1,000,000 feet of lumber, having come down from Port Blakely on her first trip with 960,000 feet of lumber. Forward there is a donkey engine and a steam pump, used in loading and discharging and to facilitate the weighing of the anchor.

Richard Jones, agent of a colony of Welsh people, has bought a tract of 800 acres near Fulton, Sonoma county. The land will be divided into 30-acre tracts.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, Aug. 31: There are about 80 men at work on this mine now. The Co. are putting in two-inch pipe all around and inside the mill for use in case of fire. The mill reservoir will be finished next week. The new hoisting works come up to expectations, and are a great improvement over the old hoist. Good progress is being made in the drifts and crosscuts in the lower levels; the west crosscut at the 550 level is now in about 275 feet and advancing at the rate of 30 feet a week. The north drift at the same level is in 165 feet. Here only 15 to 20 feet a week is made as the drift is on one of the ledges all the way, and quartz does not break as well as slate. This drift and crosscut are being driven to connect with the north and west shafts respectively at the 550 level, so as to afford good ventilation, and at the same time increase the available supply of ore. The richest gold specimens yet obtained from the Reed and Askey mine were taken out this week. They will be sent to the State Fair.

VOLCANO.—Cor. Amador *Ledger*, Aug. 31: The Volcano Tunnel Co. has bonded its mine for $180,000 to an English company, and there is a chance for all the property adjoining to be sold. Work commenced at the Bob Powers claim on Monday last. They are going to put in large reservoirs for the purpose of catching water in the winter.

SUTTER CREEK.—On Monday the hoisting works on the old McAdams mine, now owned by S. D. R. Stewart, were destroyed by fire. Before anyone had time to get to the spot the building was almost entirely demolished. Fortunately the machinery had all been moved away.

DRYTOWN.—A full force of carpenters and millwrights are at work on the new 30-stamp mill at the Cosmopolitan.

Butte.

LOVELOCK.—Oroville *Register*, Aug. 29: At the Carr mine there are six or eight men drifting and getting ready for washing the gravel this coming winter. Right opposite this mine a Shasta company have opened what is known as the Mammoth Silver Ledge. The quartz assays high in silver but the free gold that has been found in it will pay for working. In the Hough ledge they are at work and getting out some rich rock. This is thought to be a pocket ledge but it turns out some fine quartz. Between the West Branch and Kimshew the Perkins & Gallagher ledge promises finely and about 60 tons of rock are on the dump. The owners talk of putting up a mill this fall. They have a tunnel 250 feet long and have tapped the ledge at a depth of 105 feet. We hear rumors of a fine prospect of gravel on the head of Chipp's Creek by Patterson & Co. The Martha Washington mine at Kimshew, owned by Snow & Kendall, has been leased for a year. The Josephine mine has been leased for four years to Waldow & Co. Preparations are being made for working both mines this winter. The parties who have leased the mines are getting out timbers and lumber and making other preparations for the coming of the rainy season. M. Doon has the contract for furnishing the lumber to repair the flumes on the Hendricks ditch, while Boxall & Yonkers have the contract for fixing the ditch itself. The water will be brought down to the mine owned by George Perry near the mouth of the Little West Branch. Messrs. Russel, Smith, McFaddyn, Jurgenson and others are opening a mine on Big Butte Creek near the mouth of the American Ravine. They will flume Big Butte and work the bed of the stream. This promises well and when the bed rock is reached it is thought it will prove very rich. Years ago ground worked here by Fox Brothers paid finely and it is believed this mine will pay as well.

Calaveras.

AROUND ANGELS.—*Echo*, Aug. 31: Everything is being got in readiness at the Gold Cliff mine preparatory to resuming work on an extensive scale. The Bradley mine, owned by Ike Bradley & Co., and situated near Smith's Flat, has been bonded to C. R. Beal & Co. for the sum of $1000. The company will proceed at once to develop the mine. Nearly every morning since the mines have reduced their working force, owing to the scarcity of water, the stages leaving Angels have been loaded down with men in search of other fields for employment. The Utica mine is soon to have a new engine and boiler, to furnish motive-power for the mill whenever the water supply for that purpose gives out. The furnace is now being built, and the machinery will arrive in a few days.

El Dorado.

CEMENT GRAVEL.—Placerville *Observer*, Sept. 3: The Chili Ravine Cement Gravel Min. Com. have commenced a tunnel on the south side of their claim near Weaver creek. The mill stands in Chili Ravine from which a long tunnel runs easterly. From this tunnel they have recently run South, striking into a channel of rich cement gravel which is too deep to admit of its being worked from the tunnel on the Chili Ravine side. They therefore find it necessary to run in from the Weaver creek side of the divide in order to tap the channel deep enough to conveniently extract the cement gravel. The discovery of this channel will greatly enhance the value of this property. The main East tunnel at the Equator mine, is being driven ahead. Three parallel veins have been run through on the line of this tunnel, one of which is over 20 feet in width, the ore prospecting over $7 per ton. It is the intention of Supt. Burdick to commence drifting North on this ledge. It promises to open into an immense ore chute which will furnish a supply of ore sufficient to keep a 40-stamp mill running for many years without having to sink below the level of the tunnel. Mr. B. G. Parlow is now sinking a shaft on the Gentle Annie mine at Poverty Point, and is down about 40 feet. At this depth very fine ore is being found, showing considerable free gold, galena and iron pyrites. The width of the vein is not known, as the shaft does not take it all in. It is certainly a large vein of ore, and promises to make a good mine. The mill at the Rogers mine at Smith's Flat has been closed for a while on account of water. Abe Landecker, time-keeper at the Chili Ravine mine, is highly elated with the showing now made at the Chili. They are arranging to put steel rails in the South tunnel and open up the lower channel in first-class style. Preparations are being made for active operations at the Greenstone mine. Work on this mine was suspended for a few days while waiting for machinery and steel rails, a carload of which will arrive this week. The outlook at the Greenstone is decidedly encouraging. We hear very flattering accounts from the Reeg mine. Messrs. Holland & Bradley have recently started one of the National rocker mills on that mine and the ore is yielding beyond expectation.

Inyo.

CERRO GORDO.—Inyo *Index*, Aug. 28: Supt. Farrington of the Union mines is expected back in a few days. A carload of mining timbers, 8x10, is side-tracked at Keeler. Report has it that what is known as the "new shaft" will be reopened and timbered anew, and that the first extensive mining will be done on the 700-foot level. The crew now at work have kept right along where Boland & Gorman left off, and already have considerable good ore on the dump.

Mono.

THE LAKEVIEW TUNNEL.—Homer *Mining Index*, Aug. 31: The lower tunnel of the Lakeview is progressing favorably. The ledge is presumed to be about 25 feet distant. This intervening space will soon be passed through, and in a few days our anxious curiosity will be satisfied. If the ore found below is as good as that obtained above, it will be safe to call the Lakeview a first-class mine. In fact, it is generally believed to be one of the most valuable properties in the district, and if it were in the hands of live persons, it would be shipping bullion right along, as it should have been doing for ten years past. Harry Trevathen is working on the Sheboygan and getting a considerable quantity of $30 ore, while Burns of the Corinthian has been enjoying himself in Bodie for quite a spell. He is probably "getting a good ready on." Three miners will be put to work next week on the Real Top Sawyer, recently located on Mt. Gilcrest. It is said that there is plenty of good ore in sight. It is certain that there is a royal chance for a dump. Most of the waste will light on top of the Lake Canyon mill. The Josie Green folks are talking of resuming work on their promising little mine. There is more money in it than in developing the vegetable resources of Mono county with a toothless rake or in pumping grass-juice out of a reluctant cow. Jasper Parrett will start up his mill again next week, having sufficient ore on hand to run until cold weather compels him to quit. Rich concentrates from May Lundy ore are being packed down from the upper canyon and stored at the old mill for future reference. Bullion goes out of the camp regularly from various sources and by different channels, and little noise is made about it, though the aggregate is sufficient to attract attention elsewhere. Wm. Ray's claim, the Silver Crown, at Mount Gibbs, at the depth of 25 feet, shows a large ledge of fine ore. A long hole in that hill would disclose something worth seeing. The Powbattan mine is showing up well. The owners, realizing that they have a good thing, are industriously developing it. Tom Williams is hauling 100 tons of hay to the Mono mill.

RARE ADVANTAGES.—Homer *Mining Index*, Aug. 31: Homer District has advantages that few other mining regions possess. The mines may be worked to the depth of more than 3,000 feet, and neither hoisting nor pumping machinery will be required. No other section affords such facilities for deep tunneling. The Erie tunnel, when completed, will be 4,500 feet long, and intersect the ore channel in Prospect Mountain 3,000 feet below the croppings. Another 1,000 feet might have been added to this depth by starting the tunnel lower down the hill. Unlimited water-power may be obtained for driving machinery in either of these canyons; so, if mining can be done cheaply anywhere else, it can be done cheaper here.

THE GOLDEN CROWN.—"The vein in the Golden Crown is one of the prettiest things I ever saw"—so an old miner said the other day, after inspecting the ground exposed by the tunnel, which is about 200 feet. It is, in truth, a very promising mine; and every blast and stroke of the pick improves its appearance. The vein is about 20 feet wide, and the ore streak six to eight, all giving high assays, while eight or ten inches of it is the richest black metal, worth from $500 to thousands of dollars per ton. It is known to a certainty that this mine will be handled next year in a business-like manner, and it is more than probable that reduction works will be erected on an eligible site adjacent, where wood and water are abundant. The company owning the Crown and adjoining property has expended about $20,000 in the work of development, and has plenty left for further operations.

A FREE-GOLD PROSPECT.—There is a ledge of gold-bearing quartz of unknown width on the summit of Mount Gibbs, nearly 12,000 feet above the sea, and about 3,000 feet higher than Ella Bloss and Golden Crown, running northwest and southeast, with a slate country on the west and porphyry on the east. It appears to be an enormous contact vein. The slopes of the hill are covered with float quartz, some of the blocks weighing many tons, and from their shape and size it is inferred that the ledge is of great width. It is about a mile east of the silver belt, and looks well enough to induce a prospector to expend considerable work upon it.

THE MONO-BULLION.—Fred. Schwartz has, without doubt, got a good mine in the Mono-Bullion. The vein holds a steady width of about ten inches, and being good ground to work the ore is easily extracted. He will keep on during the winter, and when spring comes he will not only have a good lot of ore on hand, sufficient to afford him more than wages for his labor, but he will own a piece of valuable property.

Nevada.

BELOW THE BALTIC.—*Transcript*, Sept. 1: The new mill at the Starr mine, a mile and a half in a southerly direction from the Baltic mine, has been put in operation, and is crushing some good-looking ore. Mr. Campbell is superintending this property. Development work is being done on the Boston quartz claim, situated above the Bloomfield ditch and about a mile from the Baltic. As Sheriff Dunster was passing there Friday, he noticed that the blacksmith shop was in danger of destruction from a fire that had started on the woodwork around the forge and was spreading rapidly. He shouted to the men working in the tunnel, but getting no response turned to and extinguished the flames. After he had done so one of the miners came out and noting the situation thanked the sheriff heartily for saving the property.

CRUSHING.—*Tidings*, Aug. 31: A crushing from the Gladstone mine, near Bonivert's place and owned by J. J. Ryan and others, paid $60 a ton. Good Ore. Messrs. Brown and Spaulding are sinking from the tunnel level on the shoot of ore in the extension of the old banner, and find the ledge widening and the rock improving in quality as they sink.

THE MANZANITA.—*Transcript*, Aug. 30: Messrs. Allan & Wheeler have run the new tunnel of the Manzanita drift mine 328 feet since the 8th of last July, and they are now getting near gravel, judging from the flow of water encountered. They expect to be in pay dirt within two or three weeks. It will probably take from 700 to 800 feet of tunnel to reach the channel's center.

Plumas.

THE BUNKER HILL CON.—*National*, Aug. 24: This mine is now coming into great prominence, and is pronounced by experts to be one of the finest gravel mines in the State. It is situated at the head of Hopkins creek, about 26 miles southeast of Quincy, and is near the Sierra county line, and adjoins the celebrated North America mine. It has been worked more or less since 1857, but through bad management, never paid well; but since the property has been under the present manager, it has yielded fine returns. It is owned by a corporation, the stockholders being mostly the miners. William Metcalf of Nelson Point is superintendent, and the success of the mine and the fine condition it is in is owing chiefly to his careful management. The mine has paid so well for the last five or six months that a large debt was paid off and everything is easy to run right along. The main tunnel is in about 1300 feet, and a magnificent body of gravel has been struck; this gravel is the same deposit as the North America, and this itself bespeaks a fine mine. The appliances for working are all first-class. Twenty white men are employed now—not a Chinaman on the place. The superintendent says that they have the finest gravel mine in the country, and we hope they have.

THE MEGOWN MINE.—Greenville *Bulletin*, Aug. 28: This property is deservedly attracting attention in Plumas. It is situated six miles from Spanish Ranch toward Rich Bar, about one mile north of the old Mountain house. The discovery was made many years ago, but little work in developing it was done until within the past two years. It is what is called a contact ledge, situated beside a serpentine belt, and consists of a quartz vein in porphyry, and much of it is of a decomposed character. It is about 14 feet wide. The vein has been tapped at a depth of 100 feet. By a 700-foot tunnel, 500 foot-backs can be secured on the ledge, which stands at an angle of about 45 degrees. It may be called a rich mine. Three men rocked and panned out $172 in one day, and during four weeks they averaged $50 per day. The vein has been developed 300 feet in length. When it is known that at a depth of 100 feet the ore pays equally as well as the figures named above, the value of this property may be roughly estimated. It is owned by Mr. Megown, who has been struggling along several years in his efforts to prospect the mine in which he had so much confidence. No mill has yet been erected on the property. During six months of the year there is sufficient water-power at command to run a suitable mill.

Shasta.

OLD DIGGINGS DISTRICT.—*Free Press*, Aug. 29: Mr. Reno, a mining man from Salt Lake City, was inspecting the mines of the Old Diggings during the past week in company with Andy Fife. Mr. Morton also had a visitor from below whom he was showing around. The Old Diggings district is attracting its share of attention from mining men, while the whole county is enjoying a modest though substantial boom.

Sierra.

OXFORD.—*Mountain Messenger*, Aug. 31: The quartz ledge at the Oxford has widened to nearly four feet and the rock is exceptionally fine looking. The chimney which they have struck contained some very rich rock near the surface.

GOLD BLUFF.—The Gold Bluff Mine is about to begin raising water from the lower levels by means of 63-gallon tanks. The work of laying the pipe from the Costa ditch is expected to be completed by the end of this week. The depth to which sinking was carried by hand was about 100 feet, at which point not much if more than two inches of water was had to contend with. It is confidently believed that the present machinery will enable Mr. Van Slyke to carry his works down many hundred feet without difficulty.

Trinity.

EAST FORK.—*Journal*, Aug. 31: Jas. E. Given, from East Fork, informs us that times are lively in that camp. There are about 150 men in the camp and vicinity, and a good deal of work is being done. The Enterprise Co. will have their new stamp mill in running order in two weeks more. It is reported that two new stamp mills will be taken into the camp this fall, one to be put on the North Star mine and the other on the Yellowstone property. A good deal of development work is being done on the above-named properties. Day & Co. on the Ozark are taking out good ore, running tunnels and crushing rock. Frank Peterson has been crushing good ore from the Fountain Head. On the whole the outlook for the future of the camp is very bright. Capital has found its way in and mining operations will be conducted on a larger scale than heretofore. By the time the winter rains set in several mills will be crushing ore and a steady outt-put of bullion will add its share to the progress and prosperity of that part of the county.

A NEW MILL.—H. Junkans informs us that the mill for the North Star mine on East Fork will be shipped in about a week and will be erected as soon as possible after it arrives. The work of grading, etc., will be pushed rapidly and the timbers will be on the ground when the mill arrives.

NEVADA.

Washoe District.

UTAH—Virginia *Chronicle*, Aug. 31: On the 600 level the north drift is advanced 520 feet; formation vein porphyry with streaks of quartz, showing value.

CON. CALIFORNIA AND VIRGINIA.—The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. On the 1600 level continue to extract ore from ground bordering the south drift from the Ophir line on the sill floor. On the 1950 level the incline winze is sunk 99 feet on the slope below the track floor of this level and continues in ore of fair quality. During the week 1090 tons and 820 pounds of ore were shipped to the Morgan mill and 1762 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $28.05. Shipped during the week bullion valued at $40,912.38 to the Carson Mint and $33,284.44 to San Francisco. Now on hand in the assay office about $28,000.

OCCIDENTAL CON.—On the 300 level a north drift is advanced 69 feet from the upraise, 90 feet on the slope above this level. Formation quartz and porphyry. Extracting ore from the 350, 400 and 450 levels. During the week extracted and milled 348 tons of ore showing an average assay value of $18 per ton. Shipped to Carson Mint, bullion valued at $4670 and have sulphurets on hand valued at $10,000.

BEST & BELCHER.—On the 550 level, the northwest drift is extended 78 feet. Formation soft porphyry, with streaks of quartz. On the 1000 level the northwest drift is extended 217 feet. Formation porphyry, with streaks of quartz showing some value.

GOULD & CURRY.—On the 300 level, the north drift from west crosscut No. 2 is extended 68 feet. Formation clay and porphyry with streaks of quartz. On the 400 level west crosscut No. 1 is extended 268 feet. Formation porphyry.

JUSTICE.—The mill crushed 200 tons of ore during the week, showing a value of $28 86 per ton by battery sample assays. The 490 level southwest drift has developed a 3-foot vein of fair-grade ore, which is being stoped out.

BELCHER.—The 200 level east crosscut is in quartz, assaying from $3 to $5 per ton. The 1200 level south drift is out 305 feet, the face showing quartz. The raise above the 1200 level is in low-grade quartz.

SAVAGE.—Work was retarded in the 300 new west drift on account of a flow of water, which is rapidly diminishing. The north drift from the upraise above the 500 level is still in ore.

UNION CON.—On the 1465 level west crosscut No. 2 from the north lateral drift is advanced 334 feet, from the south line, continuing in porphyry and clay with some water.

SILVER HILL.—The 160 level northwest drift has reached the Justice line. A southeast crosscut from this drift is in quartz. The 260 level northwest drift is in porphyry.

SIERRA NEVADA.—On the 520 level from the shaft station, an east drift is advanced 1200 feet and has passed into a softer porphyry formation with some water.

OPHIR.—On the 1300 level the east drift from the shaft station, to connect with the raise above the 1465 level east drift is up 43 feet, the top in porphyry.

CROWN POINT.—The 700 level south drift is showing quartz. The 800 level south drift is in quartz and the west crosscut in porphyry and quartz.

NORTH OCCIDENTAL.—On the 400 level the north drift is advanced 117 feet. The face continues in hard porphyry and quartz carrying value.

CHOLLAR.—The 750 level west drift is out 440 feet, the face in quartz and porphyry. The 850 level north drift continues in hard porphyry.

CONFIDENCE AND CHALLENGE.—The 500 level joint Imperial west crosscut is in 100 feet, the face continuing in quartz and porphyry.

MEXICAN.—On the 1465 level the north drift from the west crosscut No. 1 is advanced 293 feet continuing in porphyry and quartz.

OVERMAN.—Top of the upraise north of winze in quartz and porphyry. Upraise above southwest drift in same material.

POTOSI.—The 750 level south drift is still striping quartz, giving low assays. The 550 level east crosscut is in porphyry.

HALE AND NORCROSS.—Crosscutting the mineral belt stripped by the 300 level north drift will begin next week.

ALTA.—Mill in full operation and stopes on the 825 and 925 levels yielding the usual quantity and grade of ore.

ALPHA.—The 382 level west crosscut is in low-grade quartz. The shaft is being sunk below the 500 level.

YELLOW JACKET.—Continue shipping 50 tons of ore daily. The 500 level west drift is out 550 feet.

IMPERIAL.—The 300 level north drift is out 420 feet from the south line, the face in quartz.

NEW YORK CON.—The raise above the 800 level west crosscut continues in quartz giving fair assays.

BULLION.—Operations temporarily suspended on the 760 level.

SEG. BELCHER.—Crosscuttting east of the 1100 level.

Como District.

ABANDONED.—Walker Lake *Bulletin*, Aug. 28: News comes from Como that everything is again shut down and the camp abandoned. Como has had many hard struggles for life.

Cortez District.

TRANSPORTING ORE.—Eureka *Sentinel*, Aug. 31: At Cortez men have begun building a track from the mine to the mill, a distance of half a mile. The cars loaded with ore will be run by gravitation to the mill, and the empty ones will be hauled back by horses.

Eureka District.

AN OBSTACLE.—Eureka *Sentinel*, Aug. 31: We learn, upon good authority, that the "timber suits" are a serious obstacle to the drainage of our Ruby Hill mines at the present time and prospecting below the water line. Nothing can be prudently done until those suits are out of the way. Blackmailing litigation has been one of the chief drawbacks to the prosperity of all our mining camps. Yet there are always men to be found in every camp who encourage it.

Garfield District.

SHUT DOWN.—Walker Lake *Bulletin*, Aug. 28: The Garfield mines are shut down, and the mill is now working on the final cleanup. We have heard no particulars as to whether the stoppage is permanent or not. The checks of the company are being protested, but Manager Hooper says all claims will be paid in full.

Wild Rose District.

A RICH STRIKE.—*Silver State*, Sept. 3: The welcome news comes from Spring City, well

authenticated, that a rich and apparently large body of ore was cut in Tunnel No. 1 of the Paradise Valley mine last Saturday night. No. 1 is the level which produced the richest body of ore ever found in the mines.

Tuscarora District.

BELLE ISLE, *Times-Review*, Aug. 30: North drift from the west crosscut, 250-foot level, extended 14 feet. Face looks favorable.

COMMONWEALTH.—North drift, 100-foot level, has been advanced eight feet. A crosscut east has been started near the face, to intersect No. 14 upraise. This crosscut is developing fine ore. As soon as the crosscut is in a few feet, the north drift will be driven on north, to open up the ore that is still in the face of drift. South of shaft, east crosscut, has been started. At the 300 foot level station have cut out and started a gangway, which is in four feet. Mill has been closed down and bullion from cleanup shipped $26,292.75.

DEL MONTE.—North drift, 225-foot level, extended 11 feet; face looks favorable. Joint crosscut, same level, extended 16 feet in vein. Main north drift, 100-foot level, extended seven feet. No. 1 crosscut has reached the hanging wall.

NAVAJO.—The crosscut from the end of the south drift, 350-feet level, extended 16 feet. No. 1 upraise, south end, same level, extended 11 feet; total height, 100 feet—continues to yield some good ore.

NORTH COMMONWEALTH.—Joint crosscut east, 225-foot level, extended 16 feet, still in vein. Main south drift, 100-foot level, extended 16 feet; the whole face of the drift in low-grade ore.

GRAND PRIZE.—Water lowered 20 feet during the past week; everything running smoothly. Concentrator was started up last Tuesday, running steadily and doing good work.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 15 feet. The water has decreased to the normal quantity, and everything is running nicely.

ALASKA.

YUKON MINERS RETURNING.—Alaska *Free Press*, Aug. 20: On Tuesday last a party of four men, consisting of Harry Spencer, J. J. Kelliher, Daniel Dowd and B. H. Ryan arrived here from the Yukon. This party started from here for the gold-fields about the middle of last May. The party prospected along the banks of the Yukon and also on Lewis river, but failed to find pay. They floated down to Forty Mile and ascended that stream as high up as Moose creek, and on the latter stream found comparatively good pay, but not sufficient to work with a rocker. The gentlemen stated that there were not a great number of men mining on Forty Mile this season, as the best pay along that stream had been worked out; but, however, some gold was being taken out, but thought the largest amount taken out by any one man would not exceed $2,000. High waters had prevailed, and had prevented miners from working the low bars, which were the richest, and many of the high bars also. A number of wheels, ditches and sluices had been washed out. In their journey they had met a party who had just returned from a prospecting trip of 200 miles up Pelley river, and they reported finding nothing that would justify working. About 35 miners were at work on Stewart river, and as none of them had come down, nothing definite was known as to what they were taking out, but the general supposition was that they were doing well. Sixty Mile creek was attracting some attention; and if the men at work there were doing well, others would go there before the season closed. All the miners were of the opinion that something big had been struck on the Tananah, the main artery of the Yukon from the west. Frank Densmore and party had ascended that stream about two years ago, and it was thought that their prolonged absence could only be the result of having found rich diggings, which they were working.

CLOSED DOWN.—The Bear's Nest has closed down work for the present on the mill and lower tunnel, but another tunnel has been started above the old one, and is now being rapidly driven into the mountain. Many wild rumors are afloat and much speculation is just now being indulged it as to the whyness of the wheretore of all this closing down of work; but as none outside of the company itself knows, we assert that no credit whatever should be given to any of the different rumors that are now floating around. The Greek boys came down from Berner's Bay this week, and report development work progressing rapidly on the Uncle Sam and Golden Crown locations. A tunnel is being run on the Uncle Sam and a shaft sunk on the Golden Crown. During this week, from the latter vein, some very fine gold ore was taken out, and both veins increase in width and richness very perceptibly as depth is gained. Other development work, on various claims in that district, is also being pushed rapidly ahead. About 100 men, mostly workmen at the Bear's Nest, left Alaska on the down-going Elder.

SILVER.—While at Douglas City this week, we learned that a very rich silver strike had been made about 125 miles northwesterly from Juneau by D. McClellan, Harry Hare and M. Campbell. One assay certificate, made on a sample of the ore by T. J. Sunny, which was submitted to our inspection, gave the handsome returns of 2,517 ounces of silver per ton; and we were informed that other assays had given from $2,000 up to high as $3,000 per ton. The ore is a chloride in character, and lies in a lime formation. This is the first ore of this character that has been found in Alaska, and now that it is known that such classes of ore exist in the extensive limestone belt to the northwest of Juneau it will lead many prospectors in that direction, and undoubtedly cause many other valuable discoveries to be made. Preparation is being made, we understand, to enlarge the Treadwell Chlorination works. Tons of sulphurets have accummulated beyond what they were able to handle, and it is necessary to enlarge their capacity to keep up with the supply from the stamp-mill.

ARIZONA.

MOHAVE NOTES. — *Miner*, Aug. 31: Henry Schaeffer shipped a carload of ore from Hackberry this week. Frank L. Smith shipped to the Rio Grande smelter four carloads of ore, and he expects to ship that many more next week. The leesees of the Crescent mine are well satisfied with the outlook. They have an eight-inch streak of pay ore, and they expect to take out several thousand dollars during the next few months. Adna Lamson, who has a lease on the Howell end of the Prince George mine, has some fine ore in sight. Col. Beattie, from the Golden Gate mine, informs us that the Monarch Co. does not intend to stop work on the Golden Gate mine, but it will be continued until the company is satisfied that there is nothing in the ledge, or ore in milling quantities is found.

COLORADO.

MAROON GULCH.—Elk Mountain *Pilot*, Aug. 29: Riding over Maroon pass to Aspen a few days ago, we were surprised to find so much mining going on up and down Maroon gulch from Aspen clear up to the divide. All along the entire distance we could hear shots on either side, and at the Sunset mine, about 12 miles this side of Aspen, quite a force of men were at work sacking the high-grade ore, and the low-grade ore was being jigged successfully. All this change has come about within the past year, and another year will make even greater changes. Charley Heusner is about making a sale of his Maroon basin property to Aspen parties. Lew Waite claims this locality will some day be as famous as Aspen mountain, as the contact cuts through lime, and in many other respects the formation is similar. Many new locations have been made. The Jenny Lind mine above Gothic is one of the coming producers for this country. It is owned by J. O. Jordan of Gothic. Work has commenced on the Crown mine, situated on Crystal mountain; it is being worked under bond and lease by some Aspen parties. There is good ore in sight to commence shipping at once. Report comes to town that Oscar Rankin has developed a fine body of ore in the Wyoming lode, situated on Baldy mountain, and belonging to a Cincinnati party. The neighborhood of the Iron Swamp, between here and Irwin, is still attracting some attention, as the mining force is being recruited constantly from various localities. The hose has arrived for the Washington gulch placer, and work will be resumed at once.

NOTES.—Georgetown *Courier*, Aug. 20: The Glendower is turning out a little very high-grade ore. Sherman & Co. are shipping good ore from the Fletcher. The Rogers is turning out ore that mills from 200 to 300 ozs. Sheetz & Co. are shipping occasionally from the Polar Star. Several parties are developing prospects about the Stevens mine. The Montreal is turning out some very good ore. McGran & Rubado have taken a lease on the Baker and commenced a new adit lower down the mountain. The Flagstaff shaft and levels have been almost entirely cleaned out, and work will probably be commenced at stoping on ore between the 50 and 70 levels. The Pelican-Dives are employing sixteen men, and all are in ore and making from two to six dollars a day. It is thought that the new company will commence development work soon.

DAKOTA.

KEYSONE WORKS.—Deadwood *Pioneer*, Aug. 30: As large a force as can be worked to advantage is now engaged setting up rolls recently purchased from the Welcome Company. Progress is rapid enough to be satisfactory to those most interested, who state the work will be completed in time for the plant to resume operations next Wednesday.

IRON HILL. — Furnaces are now undergoing necessary changes before pyritic or dry smelting begins. It is anticipated everything will be in readiness therefor in ten days or two weeks.

AFFAIRS AT GALENA.—Deadwood *Pioneer*, Aug. 28: Galena is to-day one of the busiest mining camps in the Hills. There isn't one man in the place, caring to work, who has reasons to remain idle a day. Several mines, including Sitting Bull, Ontario, Merritt, and Cora, are shipping ore and making money.

IDAHO.

YREKA DISTRICT. — Wardner *News*, Aug. 24: The opinion of all mining men familiar with the formation of this district place the mines surrounding Wardner ahead of all others. Ore is found in immense bodies, large quantities being of very high grade. It is now an established fact that the Emma and Last Chance mines are destined to become a property of great proportions. The ore body in the Last Chance going west still continues, being now nearly 200 feet long, and at place where crosscut, 34 feet wide. The east ore chute still continues, but is more broken up, being a good grade of concentrating ore. The drift is now 115 feet long, no crosscuts have as yet been run there. The west ore body has been struck in the upper tunnel in drifting 100 feet west from main upper tunnel which is 130 feet, vertical above the lower level.

SEVERAL DISTRICTS.—Idaho *Statesman*, Aug. 28: The news from the surrounding mining camps was never so encouraging as at present. There seems to be a simultaneous improvement all along the line and all around the circle. To begin with Silver City, both the Poor Man and the Oro Fino mines are in excellent ore, which is being taken out in large quantities and crushed. On Monday, two bars of about equal value were brought here from the Oro Fino, which were reshipped yesterday (Tuesday). The aggregate value of the two bars was $9,600, nearly 90 per cent of which was gold. These two old lodes are giving a good account of themselves, and may be confidently relied on to do better in the near future. Other mines in the Silver City district and in neighboring camps are making splendid showings, both in the value of the ore crushed at home and that sent abroad, but for sufficient reasons, the owners are reticent as to details. As a most convincing proof of the brightening of the mining outlook and of the belief of miners in the permanent richness of the camp, it is noted that the old town of Silver City seems to have taken a new lease of life. At Rocky Bar in Elmore county, the old reliable Ida Elmore, recently known as the Alturas Limited, is again turning out the golden bricks at a rate surpassing all its former achievements. Other mines in the Rocky Bar and Red Warrior districts are making proportionately good showings, both in ore and bullion. At Pine Grove, in the same county, a very rich body of ore has been recently struck in what is known as the Gold Hill lode. A $3000 bar of bullion from this mine was recently received here among some smaller bars from the same camp. The lode being now worked by the Andreas Brothers at Pine Grove shows a fine lot of ore on the dump ready for crushing by the new ten-stamp mill lately completed. In the Boise Basin the prospects are equally encouraging. The Washington shows a three-foot vein of gold ore, specimens from which indicate great richness. The fine mill now completed will commence crushing this rich ore about the 1st of September. From the Elk Horn, in the same county, there is no definite news at present, but the rich lode is known to be there, and the public will have to wait only a few days for cheering accounts from this and other mines in Boise county. The dearth of water in the Boise Basin this year has caused the placer mining interests to languish, but there has been compensation in the many promising quartz discoveries made during the drouth.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, Aug. 29: David Goldbaum arrived on Saturday from Alamo, where he has been at work on the Encantada mine, on the slope of Mount Tomasa. The Lane mill, which is nearly ready, will run through 100 tons of Encantada ore, most of which is already on the dump. It was learned from Mr. Goldbaum that there is great activity in milling at present. The Thorres mill is working on ore from the Quinota and Tarantula, both paying good returns. The Butler mill is grinding on quartz taken from the A. H. Butler. It is showing up lots of good ore. The machinery for the El Paso Mining Co. has arrived and is being put up. That company has quite a gang of men at work under Supt. Owen. It has let a contract to sink on the Avalina, and will have 1000 tons of ore on the dumps of its four mines before it will start crushing. Between 400 and 500 tons are now ready. In the mines, besides those already mentioned, good work is being done. The owners of the Rainbow have contracted for 100 feet each of shafting and drifting, and with this work completed they will have one of the best developed mines in the district. The vein is from 2½ to 3 feet wide. The Independencia Co. has temporarily stopped work on the Asbestos at a depth of 56 feet on account of foul air. A patent blower has been sent for and work will soon be resumed. Mr. Goldbaum reported new finds to the northwest of Alamo, about 25 miles, where Albert Haas has denounced several "vetas con pintas de oro." Specimens of the new ore found six miles from Alamo have been submitted to the assayer. It is thought the rock runs high in silver. The formation is the same as at Alamo.

MONTANA.

NEW MINING DISTRICT. — Helena *Independent*, Aug. 27: The statement that the mineral-bearing lands of Montana have scarcely been scratched is becoming more evident from day to day. Almost every 24 hours an announcement has been made of some new strike. It is now stated that J. W. Allen a miner and prospector, late of Breckenridge, Colorado, has struck it rich. This miner arrived in Montana only a short time ago and seems to have attained his most sanguine hopes in a discovery of quartz. Mr. Allen is now a resident of Helena. After visiting a number of districts Mr. Allen pitched his tent near the head of Carpenter gulch, 4 miles east of Blackfoot City, and three weeks later discovered the Little Daisy lode, which he values at $50,000. The vein is granite formation and is composed of chloride and gray copper ore; the lowest assay gives $56 and the highest $330, silver predominating, the best ore showing $225 assay per ton. The ore contains a strong copper stain. A sample has been received at this office which bears a resemblance to float. There is a degree of importance attached to the strike from the fact that quartz has never been discovered heretofore in the district, which is a comparatively new quartz district and at present is surrounded by placer gold fields.

ORO FINO.—*New Northwest*, Aug. 28: A crosscut is being run north in the tunnel of the Mountain Rat. The ore body shows up well. The tunnel is now in 769 feet and will be pushed toward the heart of the mountain with all possible speed. The Oro Fino Co. has accepted the shaft and bunk-houses recently built on its property under contract, and has advertised for bids for sinking a 200-foot shaft. The Keystone Co., which proposes to develop the George Washington lode on Powderhorn mountain, will soon become an important factor in the camp, as it proposes to get to work immediately. The George Washington is certainly a promising prospect. Ground has been broken for the Champion mill to be erected near Deer Lodge. A force of graders is now hard at work, and a number of carpenters are on the ground getting out the framework. Another and a richer strike than ever was made in the south drift of the Mountain Lion, Sunday. A quantity of ruby and crystallized ruby silver was taken out which is pronounced by all who have examined it, the richest ore ever mined in Montana. Choice specimens will run from $3000 to $7000 and, some say, as high as $10,000 per ton. Of course, this exists in no great quantity as yet, but the fact that it exists at all is "a pretty good hunch."

MICA.—*Inter-Mountain*, Aug. 29: Specimens of mica from the new mica mine near Dillon have been brought to Butte, and are in the possession of Mr. J. J. Cusick at the Clarendon. This mine is situated eight miles southeast of Dillon, and was discovered about three weeks ago. It is the property of Messrs. Pine and Smetly. A shaft has been sunk on the property seven feet, and at that depth the ledge which carries the mica is ten inches in width. Mica plates 8¼ by 18¾ inches have been taken out. Samples of the mica have been sent East, and are pronounced to be of the very finest quality.

NEW MEXICO.

MORA COUNTY.—*La Cronica*, Aug. 21: We here that a contract has been let this week to sink the Overton shaft another 100 feet. While speaking of this we cannot but review the cause of the present mining industry in our county. For years prospecting had been going on; a hole was dug in one place; a shaft was commenced in another place, but no permanent mining was going on until the arrival of Messrs. Davis and Hayes. They came here, looked over the situation, liked the formation and thereupon went to work, with a will, to find a lead. They have stuck to it now for about a year and a half, and though many obstacles were to be overcome, they are still at work—standing it through rough and plain, just as it comes; and Chas. Davis, as the chief rustler, merits to-day the thanks. Mr. Davis has not only been rustling all this time to open up the great Overton mines—for great they can justly be called—but is now out week after week to still further find aid to develop, and, therefore, open up the mineral deposit of this neighborhood. We understand that preparations are making to have a concentrator here, which will be up and doing work before six months.

OREGON.

ROBINSONVILLE DISTRICT. — Cor. Baker City *Democrat*, Aug. 31: The richness and extent of Robinsonville district is attracting mining men from all sections of the country, and it is certainly dererving of investigation. The Phœnix, owned by L. M. Barnett, Cal Berry, D. Shote, and Chas Collier, is one of the most promising mines of the district. The Aerial and Phœnix are developed by tunnel and shaft, there being about 600 feet of the continuous ore body exposed which runs high in both free gold and sulphurets. There being no crosscuts it is difficult to state the width of the vein, but it is safe to say that the ledge is from 2 to 20 feet wide. An arastra has been in successful operation for two seasons on these ores and the average of 175 tons of rock worked by this primitive process was over $50 to the ton saved. The next mine visited was the Worley which shows an immense body of high-grade ore and is second to no mine in Oregon, based on the development already done. There is 400 feet of tunnel run in on this ledge which shows a continuous ore body that averages $40 to the ton in free gold with a large per cent of high-grade sulphurets. The Bonanza and Haggard are the best developed mines in the district, there being over 1000 feet of tunnel and drift on the ledge, the Haggard being an extension of the Bonanza. The company employ about 15 men and are taking out some splendid ore. Although the ledge is small it is rich and pays for its own development.

GOLD.—Jacksonville *Times*, Aug. 28: About 20 men are engaged in the Steamboat mines, and if there is a good season next winter more than the usual amount of gold will be taken out. Reuben creek prospectors report the finding of diggings on the higher bars along the stream that will pay eight to ten dollars per day to the man. Considerable gold will be taken out there the coming winter. The Warren quartz mill on Yreka flats will be started up again soon, to crush quartz taken out at the Witherell ledge on the head of Spring gulch, near the summit of Humbug. Well diggers at Manistee have discovered blue channel gravel under a stratum of sandstone 42 feet below the surface, and miners will prospect it extensively within the next few months. D. J. M. McCoy and others have about completed the building of a wingdam in front of the town of Gold Hill, and are ready to begin work on the gravel in the river bed that has never been mined in that quarter. The low water materially aids the enterprise. The river miners on the Klamath are commencing to hoist pay gravel again, their wingdams and machinery having been repaired and rebuilt since the terrific cloudburst of July 25, which caused such great damage along the river from Cottonwood creek all the way down to Happy Camp. The Portland company, as the Portland Ditch and Hydraulic Gold Mining Company is called, now has about 40 men employed in their mining operations on Grave Creek.

UTAH.

SALE OF ASPHALTUM CLAIMS.—Salt Lake *Tribune*, Sept. 1: The Gilsonite Company, owners of the eight claims, 80 miles north of Price and three miles east of Duchesne, have just sold out for $150,000 to an Eastern company, composed of St. Louis, Akron and Columbus, O., and German parties, who are now in possession. The final details of the transaction were closed up last evening, through C. O. Baxter of St. Louis, agent for the purchasers, and who will act as manager of the property, so it is understood. These claims are in a line, each 600x1500 feet, covering a vein breasting four to six feet, and the gilsonite or asphaltum is claimed to be equal to the purest, if not the purest itself, in the world. The new company will manufacture varnish from the asphaltum besides selling it to other varnish-makers, the crude material being shipped East for manufacture. The selling parties who owned the greater part of the mine are R. C. Chambers, Richard Mackintosh and George Goss of this city. The claims were located in '85 or '86, but as they were found to be on the reservation Congress was induced to set them aside, so that they would not be lost to commerce.

THE WASATCH WORKINGS.—Park *Record*, Aug. 31: A force of 26 men is employed at the Wasatch mine, the bonanza of Blue Ledge district. The new boarding-house, blacksmith shop, etc., are being hurried to completion, and as soon as a new road is made an ore-house will be built. In sinking a winze from the upper-tunnel level to connect with the lower tunnel for air and more advantageous working, a fine vein was encountered at a point about 40 feet down. The winze is down about 50 feet, now leaving a distance of 200 feet to go through. Ore that is worth $100 a ton is exposed in various places in the mine and there is lots of it. As soon as it can be done advantageously, stoping will commence and the ore will be sent to market.

OPERATIONS BY LEASERS.—E. N. Jenkins is working the Creole on a new lease and will soon make a shipment of ore. The Jupiter leasers are getting things in shape for heavier and regular shipments of ore. Flindt & Varcoe have obtained a lease on the old Climax dump and will jig it at day-time, while the night shift will continue working the Apex dump. Jerry Richardson is working a dump belonging to the Crescent Co. on a lease and expects to make quite a shipment of jiggings before long. The leasers of the Uncle Harry, just east of the Woodside, feel much encouraged with the indications for ore soon as was shown by the past week's work. The leasers of the Nevada Northland have their shaft down over 150 feet, and if the continuation of the Woodside vein is not cut in the shaft, it will be soon after drifting commences from the 200 level, because they have the apex. Pat. Feeney, who represents some Salt Lakers, is negotiating with Kelly & Kilkenny for a lease and bond on the Little Belle group, which lies west of the Daly and adjoining the Putnam group.

MECHANICAL PROGRESS.

Scraping Surfaces.

The scraping of surfaces was first introduced by one of the greatest modern improvers of mechanical appliances, Sir Joseph Whitworth, and for tools, engines, slide-valves, planing machine beds, etc., no other system can approach it—in fact it is, when skillfully done, the only true system of perfection, as all practical machinists know. Any portion of work carelessly or slovenly done in scraping would, of course, be worse than if left from the tool of the lathe or planer. Some engineers advocate grinding nearly all the surfaces of large pistons, which 30 years ago were ground after the block and packing, or junk rings, were faced, bored and turned in the lathe. The finish was given by grinding with emery and oil until the surfaces were considered steam-tight. If carefully done, it answered the purpose, but for flat, reciprocating valves, the grinding process would, if one part of the surface were smoother than the other, be likely to wear the surfaces more of both than if the valve had been left as it came from the planer.

This would be increased on large slides, with three or five ports on the cylinder face, as the bars of the ports would not have so much surface as the valve, and by close observation of the wearing by grinding, inequalities would be found on the facings. It would, in fact, be a retrograde step to attempt to go back to the grinding system, except, perhaps, on certain work, such as finishing rings and plugs, gauges or cocks, and then the scraper is necessary to insure a perfect finish. Besides, a scraper leaves a surface that will work with much less friction than any other.

Again, there are many kinds of work that can only be accomplished so as to be perfectly tight by this mode of scraping. For instance, heavy bulk-head valves; how can these be made water-tight by any other process? If there be any other plan, the writer would be glad to know it. As every one knows, a door and seating, weighing one-half a ton or so, after the planing, if not very carefully handled, would spring, and the area of steaming or heat or seat is so disproportionate to the area of pressure, that to attempt to grind would be attended with insuperable difficulties, so that if the job is to be perfect, the scraper is the only tool that can do it. In some shops, however, it is not usual to leave wearing surfaces unscraped. Locomotive slide-valves are sometimes set to work with the tool marks upon them. It would be an interesting question to discuss, as to whether this practice is advantageous or not, for although scraping may be a good thing, it is very expensive, and it is quite possible to have too much of it.—*Exchange.*

American Mechanism.

There is probably no class of manufactures which more forcibly illustrates the superiority of American mechanism than our agricultural implements, hand-tools and utensils and machinery. The *American Exporter*, in speaking of this matter, says: "These (implements, tools, etc.) are of such a high order that they are, thus far, only appreciated in the most advanced countries—countries which pride themselves on the intelligence of their mechanics and the superiority of their own manufactures. The cruder nations, as might have been expected, are not yet fully up to even the courage, which comes from intelligence, of attempting to use our finer machinery and implements. It cannot be expected that man will, at one bound, spring from the implements of his forefathers to the magnificent labor-saving machinery of the United States. The singular result is that the most advanced nation in mechanics in the world, outside of the United States, is by far the largest purchaser of our agricultural machinery and other tools and implements.

"This is sufficient attestation of their superiority. The exports of agricultural implements during the first nine months of the present fiscal year amounted in value to $2,252,000, a gain on the same period of 1888 of over $520,000. The greater portion of this gain occurred in mowers and reapers, although plows, cultivators, etc., show an increase all around. General machinery, not otherwise specified, was exported during the nine months to the value of $5,484,000, an increase of $1,500,000 as compared with the same period of 1888. Saws and tools, most important and significant manufactures, were exported during the nine months to the value of $1,480,000, a gain of $300,000 on 1888. Locomotives were exported to the value of $685,000, a gain of over 50 per cent on 1888. Altogether the exports of iron and steel show a gain during the nine months of $3,000,000 on the same period in 1888."

WHAT A CHILD CAN DO.—No better illustration can be given of the perfect control which modern mechanism has gained over ponderous and heavy machinery than is shown in the following item, which we clip from *Chambers' Journal:* A railway train at 60 miles an hour may be compared to a huge projectile, and subject to the same laws. The momentum is the product of the weight of the train multiplied by the square of the velocity in feet per second; and if we allow a train of 120 tons, traveling at a speed of 60 miles an hour, then the work required to bring it to a standstill would be 14,400 foot-tons exerted through one minute, or nearly 1000 horse-power, which gives some idea of its destructive force if, unhappily, it should come into action, and yet this terrific power is so entirely under command that the strength of a child turning the small handle of the vacuum brake can bring the train to a stand in a few seconds.

Brass and Its Treatment.

The *Industrial World* gives the following useful practical point in the art of making brass: Brass is perhaps the best known and most useful alloy. It is formed by fusing together copper and zinc. Different proportions of these metals produce brasses possessing very marked distinctive properties. The portions of the different ingredients are seldom precisely alike; these depend upon the requirements of various uses for which the alloys are intended. Peculiar qualities of the constituent metals also exercise considerable influence on the results.

Alloys of copper and zinc retain their malleability and ductility when the zinc is not above 33 to 40 per cent of the alloy. When the zinc is in excess of this a crystalline character begins to prevail. An alloy of one copper to two zinc may be crumbled into a mortar when cold.

Yellow brass that files and turns well may consist of copper 4, zinc 1 to 2. A greater portion of zinc makes it harder and less tractable; with less zinc, it is more tenacious and hangs to the file like copper. Yellow brass (copper 2, zinc 1) is hardened by the addition of two or three per cent of tin, or made more malleable by the same proportion of lead.

There would be less diversity in the results of brass castings if what was put into a crucible came out of it. The volatility of some metals, and the varied melting points of others in the same mix, greatly interfere with the uniformity in ordinary work. Zinc sublimes (burns away) at 773 to 800 degrees, while the melting heat of the copper with which it should be intimately mixed in making brass is nearly 1750 degrees. Copper, zinc, tin and lead in varying proportions form alloys, always in definite quantity for a given alloy. The ease with which some of the metals are burned away at comparatively low temperatures, renders it a very easy matter to make several different kinds of metal with the same mix. This very thing occurs, and the great difficulty in getting bearing brasses uniform in quality causes some engineers to babbitt all bearings as the best way to insure uniformity. One lot of castings may be soft and tough, another hard, and so on.

Zinc is added the last thing as the crucible comes out of the furnace, and the mixing of the mass is a matter of uncertainty. If the metal is too hot for the zinc, a large percentage goes off in the form of a greenish cloud of vapor, and the longer stirring goes on the more escapes. The two metals which enter into the composition of brass have an affinity for each other, but they must be brought into intimate contact before they will combine. Some brass founders use precaution to prevent volatilization of the more fusible metals, introducing them under a cover of powdered charcoal on top of the copper.

THE Coronado foundry has secured the contract to supply 500 tons of iron castings to the San Diego Cable-Car Company, and has agreed to deliver the yokes at the rate of 75 per day. Mr. Tonkin, the superintendent of the foundry, is formulating a plan which will be of great benefit to the road, and allow a buggy to pass over the rails without any perceptible jar. He is causing a dummy carriage to be constructed, which will follow the cement men, who will lay the cement flush with the top of the track. The dummy carriage will have a flange three-fourths of an inch in thickness, which will be deep enough to cut the cement away for the wheel of the car, but not deep enough or wide enough for a buggy-wheel to get into.

NEW USE FOR SHEET STEEL.—There is a new use for steel, as displayed at the Paris Exposition, that is attracting the attention of engineers. It is the making of engine and car frames from steel cut by hydraulic pressure from large sheets. An ordinary frame rots in ten years, and it is estimated that this will last a century. It is also said that steel is exhibited which has been made from a low-grade pig iron at a cost of $4 a ton, and that the process of producing aluminum cost but $1 a pound.

THE BIGGEST GIRDERS YET.—In the new addition to the American Museum of Natural History, New York, will be used the largest box or riveted girders ever employed in the construction of a building. These girders were designed to support the floors and partitions, and thus obviate the use of pillars or columns, the object being to give unobstructed floor room for the display of specimens. There are 28 of these girders, measuring about 62 feet in length and weighing 40,000 pounds.

HARDENED STEEL TOOLS.—The *Scientific American* says that hardness on steel tools, almost equal to that of the diamond, is obtained by plunging them, when white hot, into sealing-wax, repeating the operation until the steel is too cold to enter the wax. The tool is then just touched with oil of turpentine.

THE USE OF RIVETS for securing seams of steam boilers is being supplanted by electric welding.

SCIENTIFIC PROGRESS.

Telephone Vibrations.

A New Method by Which They are Made Visible to the Eye.

At a recent meeting of the Physical Society, Berlin, Dr. Frohlich made a further communication in connection with his older, resultless experiments on the objective demonstration of the vibrations of a telephone disk, in order to describe his new method by which positive results had been obtained. In his earlier experiments he employed manometric flames, and endeavored to photograph their movements with the help of a rotating mirror; now, however, he attached a small mirror to the iron plate of the telephone, and from this the light of an electric lamp is reflected on to a polygonal rotating mirror, from which it falls upon a screen. The vibrations of the plate were thus made visible on the screen, and since each side of the polygonal mirror cast its own image, when the mirror was rotated the curves were seen moving over the screen. The more rapidly the mirror was rotated the slower did the curves move over the screen, and when the rotation was as rapid as the vibration of the plate, the curves became stationary and could thus be exactly observed and drawn. These luminous curves could also be photographed. The speaker had employed this method in a series of researches on certain electrical phenomena which might influence the efficiency of the telephone. Thus the action of alternating currents, of self-induction, of the rise and fall of the current on making and breaking, of the introduction of electro-magnets, and of other conditions, were studied by means of the altered mode of vibration of the telephone plate. The speaker had further obtained a graphic record of the vibrations of the telephone plate when vowels and consonants are sung and spoken into it. Many other problems may, by the above method, be brought nearer to their solution.—*Science.*

The Great Heat of Siberia.

Siberia is commonly regarded as a region of ice and cold, but according to Mr. George Kennan, it is, in summer-time, about as hot a country as there is on the face of the globe. In one of his remarkable Siberian narratives given in the *Century Magazine*, Mr. Kennan thus relates one of his hot weather experiences:

"The farther we went up the Irtes'h the hotter became the weather, and the more barren the steppe, until it was easy to imagine that we were in an Arabian or a North African desert. Thermometer ranged day after day from 90° to 103° in the shade; the atmosphere was suffocating; every leaf and every blade of grass, as far as the eye could reach, had been absolutely burned dead by the fierce sunshine; great whirling columns of sand 100 to 150 feet in hight swept slowly and majestically across the sun scorched plain; and we could trace the progress of a single mounted Kirghis five miles away by the cloud of dust which his horse's hoofs raised from the steppe. I suffered intensely from the heat and thirst, and had to protect myself from the fierce sunshine by swathing my body in four thicknesses of blanket, and putting a big down pillow over my legs. I could not hold my hand in that sunshine five minutes without pain, and wrapping my body in four thicknesses of heavy woolen blanketing gave me at once a sensation of coolness. Familiar as I supposed myself to be with Siberia, I little thought when I crossed the frontier that I should find in it a North African desert, with whirling sand columns and sunshine from which I should be obliged to protect my limbs with blankets. I laughed at a Russian officer in Omsk who told me that the heat in the valley of the Irtes'h was often so intense as to cause nausea and fainting, and who advised me not to travel between 11 o'clock in the morning and 3 o'clock in the afternoon, when the day was cloudless and hot. The idea of having a sunstroke in Siberia, and the suggestion not to travel there in the middle of the day, seemed to me so preposterous that I could not restrain a smile of amusement. He assured me, however, that he was talking seriously, and said that he had seen soldiers unconscious for hours after a fit of nausea and fainting, brought on by marching in the sunshine. He did not know sunstroke by name, and seemed to think that the symptoms which he described were peculiar effects of the Irtes'h valley heat, but it was evidently sunstroke that he had seen."

THE ROOTS OF PLANTS AS MANURE.—An important part of good farming consists in husbanding all the resources of the farm. One important resource of fertility is found in the stubble and use of plants. The roots of all plants serve to support the plants themselves and to gather food and water from the soil; they contain woody fiber and so are useful in providing vegetable matter to the soil, for which reason clover, being a full grower and a plant that extends its roots deeply into the soil, becomes a recognized agent in producing an improved condition in a partially impoverished soil. In some experiments at the Storrs School Experiment Station with cow peas, it was found that so much of the roots as could be pulled from a light loam with yellow and compact subsoil would give a yield of 558 pounds per acre. Another section of the same field would give of stubble and first six inches of roots 912.3 pounds, and that to a depth of 42 inches the yield would be 1207.8 pounds per acre. We therefore get some idea of the quantity of matter that under ordinary circumstances can be secured from an acre of ground. It is also found that an average crop of cow peas grown will leave in the soil by virtue of the roots and stubble, 14.5 pounds of nitrogen, 2 8 pounds of phosphoric acid; and 6.4 pounds of clover roots will leave in the soil 35.5 pounds of nitrogen, 10 pounds of phosphoric acid and 15 pounds of potash, and with the stubble 180 pounds of nitrogen, 71 pounds of phosphoric acid and 77 pounds of potash, or a value equivalent to that paid for some of the commercial fertilizers in the market per ton. Thus it is seen the important part played by the roots of plants in the matter of adding to fertility.

NATURAL GAS IN SOLID CHUNKS.—The Cleveland, Ohio, *Press* of August 1st gives the following, which perhaps should be received with more caution than was the first announcement of the solidification of petroleum, which, however, proved to be a reality: The process of condensing natural gas, invented and patented by Adrian Hill of this city, is attracting widespread attention. Every mail brings letters from capitalists inquiring into the merits of the invention. The great possibilities of it have attracted the attention of the Standard Oil Company, and representatives of that corporation from Cleveland and New York have made the inventor flattering propositions should the plan prove a success. Hill said there could be no doubt as to the possibility of his process. He is now engaged in the construction of necessary apparatus, and will shortly give a practical exhibition by reducing a quantity of natural gas into solid substance. The process itself, as well as the machinery needed to carry it out, is very simple. Gas when transformed into solid matter is not dangerous to handle. Its expansive force is very great, and when the substance becomes heated above a certain degree it will become very volatile and will burst an ordinary cask or can, but the effect is gradual, and it does not explode. The inventor claims that with a ten-horse power engine he can reduce enough gas in one day to supply a city of 50,000 inhabitants with fuel for 24 hours.

ENCOURAGING SCIENCE.—The Vermont Microscopical Association has just announced that a prize of $250, given by the Wells & Richardson Co., the well-known chemists, will be paid to the first discoverer of a new disease germ. The wonderful discovery by Prof. Koch of the cholera germ, as the cause of cholera, stimulated great research throughout the world, and it is believed this liberal prize, offered by a house of such standing, will greatly assist in the detection of micro-organisms that are the direct cause of disease and death. All who are interested in the subject and the conditions of this prize should write to C. Smith Boynton, M. D., Sec'y of the association, Burlington, Vt.

A NEW MOTIVE-POWER.—As motive-powers, steam and electricity are threatened with a new rival. M. de Susini, a Corsican doctor, has, it is asserted, after 20 years' perseverance, constructed a motive apparatus or propeller, of 20-horse power, which is worked by sulphuric ether, a result which the doctor anticipates will realize a saving of 65 per cent of the combustible material at present employed for setting machinery in motion. Experiments with the apparatus have been made before scientific men at Paris. To pronounce any decisive verdict on the merits of the new agent would as yet, however, be evidently premature.

NEW METALS.—According to the *Chemiker Zeitung* (Coethen), at the last sitting of the Russian Mineralogical Society, K. D. Chrustschoff demonstrated the existence of a new metal which he has just discovered, and to which he gives the name russium. It approximates closely to thorium, and is one of the bodies whose existence was foreseen by Prof. Mendlejeff. We learn also that Dr. Kruss has named the metal which he has detected along with nickel and cobalt, gnomium.

AN ABSURD PARAGRAPH has been going the rounds of the papers, stating that a mild winter always indicates an unusual number of thunderstorms in the succeeding summer. Thunderstorms, more than any other meteorological phenomena, are dependent upon local and temporary conditions, and the unseasonably warm weather of last winter will have no more effect upon the summer's electrical disturbances than it will upon the next Presidential election.

A HOP-PICKING MACHINE has been invented lately by R. W. Peterson. The Santa Rosa *Republican* says it separates the leaves from the hops, leaving the latter free from both stem and leaves. The invention is claimed to be a great saving in time and labor in harvesting this important crop, and samples of work shown prove that it works successfully.

FROM the general appearance of the vegetation, together with a discussion of the origin and relations of the flora, it is concluded by eminent botanists that Greenland is not a European province from the point of view of botanical geography, but has nearer relations to America.

GOOD HEALTH.

Vertigo.

Any disturbance of the blood circulation in the internal ear, especially in that portion known as the semi-circular canals, will give rise to a feeling of dizziness or vertigo. This symptom is by no means uncommon, and is so often felt by persons who are otherwise in perfect health that little attention is generally paid to it. It is true that in many cases one may be perfectly safe in not heeding it, yet recurring or prolonged attacks of dizziness should never pass unnoticed.

In what is known as Meniere's disease, which is associated with a chronic affection of the internal ear, the patient suffers paroxysms of intense dizziness, accompanied with loud ringing in the ears, the attacks becoming more and more severe and prolonged as the disease progresses.

In the great majority of cases, however, the explanation of the vertigo is to be found in some local departure from the normal condition, the real source of the trouble being perhaps at some distance from the parts affected.

In the ear itself we may have a foreign body pressing on the drum membrane, or an increased pressure in the drum cavity, such as happens when the passage to the ears is stopped, and an excess of fluid accumulates. The same condition may arise also from an error of vision, in which case it can be explained only by the intimate nervous connection between the two organs, an overstraining at one portion of the nerve circuit showing its effects at the other.

Most interesting of all, however, is the connection between this symptom and certain disturbances of the stomach. Vertigo and nausea often go together, as in the case of persons who swing violently, or in those who are seasick. By means of the intimate nervous connection, any irritation or disturbance of the functions of the stomach will react on the blood supply of the ears, and vertigo may thus be an indication of indigestion or an overloaded stomach.

The heart is still another organ connected with this same nervous chain, and this fact explains how it is that palpitation is sometimes met with under similar circumstances. This fact may serve as an additional warning against the use of alcohol and certain drugs which cause dizziness when taken into the stomach.

In persons of full habit, with large excess of blood, vertigo may precede an attack of apoplexy. In any case, the wise course is to avoid all effort, and remain in a reclining position while the attack lasts.

"FORTY WINKS."—Sound, refreshing sleep is of the utmost consequence in securing good health, and no substitute can be found for it as a restorer of vital energy. Sleeplessness is, however, often a source of great trouble to elderly people, and one which is not easily relieved. Narcotic remedies are generally mischievous; their first effects may be pleasant, but the habit of depending upon them rapidly grows until they become indispensable. When this stage has been reached the sufferer is in a far worse plight than before. In all cases the endeavor should be made to discover whether the sleeplessness be due to any removable cause, such as indigestion, cold, want of exercise and the like. In regard to sleeping in the daytime, there is something to be said both for and against that practice. A nap of "forty winks" in the afternoon enables many aged people to get through the rest of the day in comfort, whereas they feel tired and weak when deprived of this refreshment. If they rest well at night there can be no objection to the afternoon nap, but if sleeplessness be complained of the latter should be discontinued for a time. Most old people find that a reclining posture, with the feet and legs raised, is better than the horizontal position for the afternoon nap. Digestion proceeds with more ease than when the body is recumbent.

WHAT THE KNEES INDICATE.—The knees of a man are an unimpeachable index of his character; that is, if they have not been injured so that their natural action is impaired. A strong character is accompanied with a strong walk. A weak character is shown in the weak knees and the shilly-shallying, scraping walk. If one should desire the performance of a deed which requires nerve and perseverance he would never trust it to a man who drags his legs about as if they were made of lead, or who walks as if his legs were half asleep. If you want to measure a man's character, and have not the time to scrutinize and analyze his features and through them the soul, study his nether extremities and how he uses them. You will get from his legs in action, and sometimes from his legs in repose, the general outline of his being. And you may be quite sure that the idea you so glean is, in nine cases out of ten, the correct one.—*Detroit Free Press.*

IS ICE WATER A HEALTHY DRINK?—In the opinion of the editor of the *Sanitary Volunteer*, the official organ of the New Hampshire Board of Health, there is a great deal of sentiment and many opinions regarding the use of ice water that vanish when the light of reason and experience is turned upon them. The fact is, that ice water, drank slowly and in moderate quantities, constitutes a healthful and invigorating drink. There is no doubt that ice is a great sanitary agent, and every family ought to be provided with it during the warmer months of the year. It is true that the inordinate use of ice water, or its use under some special conditions and circumstances, is attended with great danger; so is the improper use of any other food or drink. The assumption that iced water is dangerous, and that iced tea or iced coffee, or iced lemonade is a harmless substitute, is simply a delusion. As the source of danger feared by some is the degree of cold, we fail to see clearly how flavor modifies the effect of temperature. There are individuals, undoubtedly, who cannot drink ice water without injury, and who ought never to use it, but to a great majority of persons it is refreshing and healthful. Its use, temperately and discreetly, is in no way to be condemned, which cannot be said of some of its substitutes.

POISONOUS ICE CREAM—THE TONKA BEAN — A well-known Hartford (Conn.) druggist offers as a possible solution of the frequent cases of poisoning from ice-cream the following suggestions: His investigation in the Glastonbury case revealed the fact that the cream, made in the same freezer but flavored differently, caused no poisoning, while those who ate of a particular lot of vanilla cream were all more or less affected. This led him to believe that the trouble was in the "vanilla" flavoring, and he succeeded in procuring a bottle of the extract that was used for this occasion for examination. So far as it was possible to ascertain without a chemical analysis, the "vanilla" extract contained not one trace of the true vanilla bean, but was simply a strong extract of the "tonka" bean, or, as it is sometimes called, "snuff" bean, which is a poison, although to the uninitiated it has a similar odor and taste to vanilla. The "tonka" bean sells for about $1 a pound, while the best vanilla beans cost from $15 to $20 a pound. The conclusion that the druggist arrived at was that all the mischief was caused by tonka beans, which unprincipled dealers sell for vanilla. It isn't well or safe to buy a cheap extract of vanilla.

EYESIGHT IN THE SCHOOLROOM.—Mr. Priestly Smith, ophthalmic surgeon to the Queen's hospital, Birmingham, has prepared for the school board of that town a series of golden precepts on this important subject, which, legibly printed on a mounted scroll, are to be hung up in all the board schoolrooms. Seven cardinal maxims are all that are considered needful for the scholar to bear in mind. These are: "Sit upright, sit square, keep your eyes at least 12 inches from your work, write on a slope and not on a flat table, read with your book well up, do not read very small print, do not work in a bad light, and if you cannot see your work properly, tell your teacher." As there is nothing like pictorial example, this is illustrated by four drawings exhibiting good and bad positions.—*New York Telegram.*

USEFUL INFORMATION.

How Gold-Leaf Should be Handled and Laid.

I find there are very few painters who know how to handle gold-leaf properly. I will give my mode, and would like to hear of a better one.

Procure a surface board, 2½ feet in length and 8 inches wide. Lay your book of leaf on this board, and with a knife or pair of shears, cut the back of the leaves off where they are bound together. Take a small piece of unbleached muslin, wet it with clean turpentine, and with this rub over the top layer of paper. Lift the paper and place on your board so the edge of the paper will extend half an inch or so over the edge of the board, so you can pick it up with ease. Care should be taken not to get the cloth too wet, or the turpentine will go through the first layer of paper and leaf to the second, and stick the two together.

Proceed in this way until about half of the book is lifted, if you need that much. It is best not to lift too much at a time, until you get it out the size wanted, as it will handle and cut much nicer if done while the paper is damp.

The above process is intended for large stripes only. For ½-inch stripes and under, in place of wetting with turpentine, lift the first layer of paper and give it a few rubs on your trousers' leg to get the chalk off, and then a few rubs on your hair. Then place back on the leaf, and press evenly and hard with the edge of your hands. Take care to keep the paper from moving on the leaf, as it will tear it if moved the least bit.

One leaf can be cut in pieces small enough to lay eight or ten feet of stripe, and, with a little practice, it can be done very speedily, too. In cutting, hold the paper so the pieces will fall on the board with their ends extending over the edge half an inch, so you can pick them up with the thumb and forefinger. Never attempt to cut the leaf with new or newly ground shears, but get the ones with which your wife lets the kids make paper dolls, and you will find those just right.

In using turpentine, do not lift more than will do the job in hand, as it will dry up and come off and be wasted, or stick to the paper so you cannot get it off. In using the outside leaf or cover, put it on while quite wet, or the leaf will not come off. The finish on the paper will stick the leaf and paper together, if allowed to dry. If painters using the tip will try this method, I think they will find they can lay twice the amount of leaf in the same time and with very little waste.—*W. V. G., in Varnish.*

HOW HAIR CLOTH IS MADE.—Many people understand, of course, how hair cloth is made, but for the edification of those who do not, we will explain the process. In the first place, horse hair cannot be dyed. It repels coloring matter. So to make black cloth it is necessary to secure natural black hair. The horses, in many cases absolutely wild, running unrestrained, are regularly corraled and shorn. Of course black hair is preferable, but sometimes gray stock is utilized. Not only the tails but also the manes are cut; the hair is bunched. These bunches seldom contain hairs of less length than two feet; some are even three and 3½ feet, and the thickness of the bunches is usually two or three inches. The hair-cloth looms are provided with what we may call a nipper, in place of a shuttle, and the nipper is so finely actuated that it travels across the warp and seizes from the bunches one hair only, the jaws of the nipper being too fine to grasp more than one, and carries it across the weft threads, dropping it into its exact place. The action of the loom mechanically forces the hair next to its predecessor, the warp crosses upon it, snugly holds it in its place, the nipper travels back and seizes another, and so on and on. The delicacy and almost human accuracy with which each separate hair is placed between the warp threads is really incredible.—*Upholsterer.*

VEGETABLE DIET.—The Chinese are vegetarians, partly on account of their religion, partly from force of long habit and perforce of circumstances. Their country is so densely peopled with human beings that the land must be closely cultivated to the best advantage. As every one knows, flesh-eating is a most wasteful practice, as the same amount of land will support 30 or 40 times as many persons taking the products of the earth at first hand, as when taking corn and other vegetable products at second hand in the form of flesh. In view of these facts, it is not singular that the few foreign cattle found in China are carefully preserved for labor instead of being eaten. A recent writer makes the following assertions: "Beef is never seen on a Chinese table, oxen and cows capable of working the plow being counted too valuable to the farmer to be consigned to the butcher. Very severe penalties are attached to the slaughter of these animals. The punishment for the first offense is a hundred strokes with a bamboo, and then two months in a wooden collar. Should love of beef or desire of gain induce a repetition of the crime, a second judicial flogging is followed by exile for life from the province."

KILLING ANTS.—A writer in the *Maine Farmer* tells how he kills ants: "I took about a half-saucer of molasses, and to this I added about a tablespoonful of Paris green, and stirred well, placed one in the cellar-way and another down cellar; and any time for a week or two, I don't remember just how long, if I went to these saucers I would see the shelves nearly black with them coming and going. I left them there until there were no signs of any ants around them. I never found one dead ant, and it has been four years since I fed them on molasses and Paris green, and yet, strange as it may seem, I never have seen one since. I will say, further, that our house is an old one and had been overrun with them for years. Care should be taken to keep all eatables out of the way. The ants disappeared from all parts of the house before they did from around the saucers. This has been my experience with ants, and if they ever return they will be fed the same as before."

DISHCLOTHS THAT GROW ON VINES.—A vine to shade the porch and furnish the next year's supply of dishcloths may be grown at the same time by planting a few seeds of luffa or dishrag gourd. It is quite common in the South. The vine, with its dark, silvery-green leaves, is quite pretty. The fruit is about two feet long, and it is the tough, elastic, fibrous lining that is used for dishcloths.

TRANSPARENT VARNISH FOR METALS.—For a green transparent varnish for metals, grind a small quantity of Chinese blue with double the quantity of finely powdered chromate of potash (it requires the most elaborate grinding); add a sufficient quantity of copal varnish thinned with turpentine. The tone may be altered by adding more or less of one or the other ingredients.

PRICE OF OLD BOOKS.—Books published 300 years ago sell for $25 to $500 a volume. Many modern authors, whose unsalable editions are reposing on book-sellers' shelves, must regret that they didn't have their works printed in the fifteenth century. But we don't suppose they thought of that.

AN ounce each of pulverized cloves, cinnamon and cedar perfumes agreeably and tends to keep moths from bureau drawers.

IN proportion to the population, there are more Massachusetts people in the State of Iowa than in Massachusetts.

ENGINEERING NOTES.

High Speed on Railroads.

A Hydraulic Railway.

A large amount of attention seems to be directed, just at this time, to high speed on railroads. Fifty and sixty miles an hour, and that only for short distances and on straight and level grades, was the utmost that was looked for a few years ago; but at the present time nothing less than 100 miles would seem to meet expectation in the early future. The projected parcel railway, as described in these columns two weeks ago, promises a much greater speed; but that is only for mail and express matter. No passengers will be carried.

There are many things connected with high speeds on railways which tax the ingenuity of locomotive engineers to the utmost. The lines have to be made strong enough to withstand the heavy blows of the locomotive, for the other portions of the running plant are light in comparison. A railway train running at 60 miles an hour may be compared to a huge projectile, and subject to the same laws.

The wonderful hydraulic or "Water Railway," as exhibited in Paris, although looking very much like a flight of fancy, may, if it be found at all practicable, prove a neck-and-neck competitor with the electric railway for high-speed railways. This extraordinary invention has a carriage without wheels. For the wheels hollow slides or skates are substituted and the carriage is pushed along in a grooved rail. When it is desired to set the carriage in motion, water is forced into the slide or skate of the carriage from a reservoir by compressed air, and seeking to escape, it spreads over the under surface of the slide, which it raises for about a nail's thickness above the rail. The slides thus resting, not on the rails, but on a film of water, are in a perfectly mobile condition; in fact, the pressure of the forefinger is sufficient to displace a carriage thus supported. The propelling force is supplied through the pillars, which stand at regular intervals on the line between the rails. Running underneath every carriage is an iron rack about six inches wide, fitted with paddles.

Now as the foremost carriage passes in front of the pillar, a tap on the latter is opened automatically and a stream of water at high pressure is directed on the paddles. This drives the train on, and by the time the last carriage has passed the tap (which then closes) the foremost one is in front of the next tap, the water's action thus being continuous. The force developed is almost incredible. There is some splashing on the rails at the start, but this diminishes the faster the train goes. To stop the train, the small stream of water that feeds the slides is turned off and the latter coming in contact with the rails, the resulting friction stops the carriage almost instantaneously.

A correspondent of the London *News* gives the following as his experience on the short experimental road in operation on the *Esplanade des Invalides* at Paris: "The train consisted of four carriages, affording room for about 100 passengers. Having taken our seats, and the signal being given, we glided along gently for the space of a few yards, when suddenly we gathered speed; two or three tugs were felt and we were flying on at the pace of an ordinary train, but as smoothly as a boat on a river. There was a clicking noise on the rails; but this I was assured was due to a defect in the construction of the slides, and would be remedied. The absence of any vibration, or shaking, was wonderful. A slight jerk there was at regular intervals, but then again I was told that it was due merely to the shortness of the course and the inability to get up a proper pace. In a hydraulic train traveling at full speed, that is to say, at the rate of 87 to 124 miles an hour, there would be almost no consciousness of motion. The journey down the length of the esplanade only occupied a few seconds. A water train running at over 100 miles an hour could, I was told, be pulled up within 30 yards, could climb up gradients of 16 inches in the yard, descend them with equal safety, and run on curves of 44 yards radius. This system would seem peculiarly adapted for elevated railways in cities, being light, noiseless, smooth, without smoke, fast and thoroughly under command."

High-speed traction is in the air, and various schemes are afloat to still further annihilate distance, an essential part of such schemes being the use of stationary engines at points along the line. While mechanical difficulties of an apparently insurmountable nature seem to arise at the suggestion of such speeds, there are not wanting engineers who believe in the possibility of both these undertakings, and great interest must attach to the experiments, which may lead to the development of railways working at speeds almost undreamt of, except in the scientific romances of the present day.

ROPE DRIVING WHEELS.—In many of the large manufacturing establishments in England the practice is to bore the hubs of large rope driving wheels larger than the shaft, and hang them on keys—an old millwright practice in this country. This insures getting the wheels to run true, which is not always an easy thing to do in the instance of wheels from 30 to 40 feet in diameter bored to fit the shaft.

TABLE OF CONTENTS.

EDITORIALS.—Working a Chinese Coal Mine, 181. Passing Events; Bimetallism Abroad; Reorganization of the Sutro Tunnel Co.; "No Patent, No Pay;" Eastern Oregon Mines, 188. Amador Co. Lignite, 189.
ILLUSTRATIONS—Sketches Showing Method of Working Tong Colliery, China, 181. A Partial View of San Buenaventura, Cal., 183. Shaft of Ione Coal and Iron Mine; Section in 54-foot Shaft, 189.
CORRESPONDENCE.—A Californian at the Paris Exposition; A Bad Mining Law, 182.
MISCELLANEOUS.—The Mineral Palace; The Forty-Niners; The Adelaide Copper Mine; For the Advancement of Astronomy, 182. Town-Sites and Auriferous Lands; Patents and Progress; San Buenaventura, 183.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 184-5.
MECHANICAL PROGRESS. — Scraping Surfaces; American Mechanism; What a Child Can Do; Brass and Its Treatment; New Use for Sheet Steel; The Biggest Girders Yet; Hardened Steel Tools, 186.
SCIENTIFIC PROGRESS. — Telephone Vibrations; The Great Heat of Siberia; The Roots of Plants as Manure; Natural Gas in Solid Chunks; Encouraging Science; A New Motive-Power; New Metals, 186.
GOOD HEALTH.—Vertigo; "Forty Winks;" What the Knees Indicate; Is Ice Water a Healthy Drink; Poisonous Ice Cream; Eyesight in the Schoolroom, 187.
USEFUL INFORMATION — How Gold-Leaf Should be Handled and Laid; How Hair Cloth is Made; Vegetable Diet; Killing Ants; Dishcloths that Grow on Vines; Transparent Varnish for Metals; Price of Old Books, 187.
ENGINEERING NOTES. — High Speed on Railroads; Rope-Driving Wheels, 187.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 196.

Passing Events.

The news from Alaska is not encouraging for quartz-mining. The largest mine, the Treadwell, has some of its stamps lying idle for want of drillers. The Bear's Nest has shut down altogether for lack of ore.

There is some complaint from the interior about the agents of a Michigan syndicate taking up tracts of timber land where there is mining ground. It seems too bad that it is possible to obtain universal ground under agricultural and timber titles, but a good deal of mineral ground is being occupied in that way.

The reorganization of the Sutro Tunnel Co. means increased work up there. It is said that the new company will pursue a vigorous policy.

Register Bradford of the San Francisco Land Office has received a circular letter from the General Land Office, directing him to cancel all filings on all sites for reservoirs, ditches, or canals, which may have been reserved for irrigating purposes by the Geological Survey, and lands which may be susceptible of irrigation by such reservoirs which have been made since Oct. 2, 1888.

There is considerable activity in certain portions of Mono county as is indicated in our mining summary. There is still a great extent of unprospected country in that and Inyo county.

Bimetallism Abroad.

A late issue of the New York *Journal of Commerce* gives a full synopsis of Consul Mason's reports on the growth of bimetallism in France. Located as he is at Marseilles, and occupying the honored position of representative from this country, he has rare opportunities of studying the subject in its various bearings, and therefore his report is a valuable contribution at the present time. Consul Mason says that the Bimetallist Commercial party in France has gained enormously within the past two years. The Consul in his report to the State Department at Washington incloses an extract from a statement published by the official organ of the Marseilles Chamber of Commerce, which gives the keynote to the agitation now going on not alone in France, but also in Germany and the United Kingdom. As the excerpt contains much of interest we present the same not only for the benefit of the mining industry, but also for advocates of the double-standard metallic currency. The extract is as follows:

But if silver has lost so largely from its value in Europe, it is not so in India and China, where it is eagerly sought for in exchange for agricultural and manufactured products. In order to obtain our silver, which she needs, Asia has only to send us her merchandise, and naturally she sends it to us as copiously as possible. Now the present depreciation of silver in Europe (or, in other words, the appreciation of gold) amounts to 27 per cent, and it constitutes a premium of 27 per cent on Asiatic exportation and a disadvantage of an equal percentage on our export commerce to Asia. It should be remembered, moreover, that the people with whom we are under this detestable disadvantage comprise seven-twelfths of the inhabitants of the globe. The demonetization of silver which has taken place in the countries of the Latin Union thus constitutes for India and other countries with the mono-metallic standard a protective duty against importations from Europe. European products sold in Asia are paid for in silver, and, since silver now loses 27 per cent, our exporters are obliged to increase by that proportion their export prices in order to realize the same profits that they obtain upon goods sold at home. But at these exaggerated prices they find no purchasers, and the double result of the monetary revolution accomplished in 1873 has been to flood our markets with foreign products at prices which defy home competition. Wheat, cotton, oleaginous grains, sugar, wool, raw silks, corn and manufactured goods from Asia, and wool, tallow and hides from South America, are poured in upon us in ever-increasing quantities, while their markets are practically closed to us by this fatal disadvantage of exchange.

It is therefore of the first importance to re-establish the equilibrium arbitrarily broken in the monetary circulation, and to end the trouble which paralyzes commercial relations and overrides import tariffs by suppressing the abnormal advantages now enjoyed by the countries whose standard of currency is silver. To do this there should be a general return to the French bimetallic standard as established by the law of the year IX (March 29, 1801), with a fixed relation between the values of gold and silver. This system was thoroughly and successfully tested for 70 years, and it furnishes the only secure guaranty against the violent and disastrous perturbations caused by the present variations between the values of the precious metals.

The presentation of bi-metallism so tersely and strongly as that made by the Marseilles Chamber of Commerce, must have weight, coming as it does from a representative class that speaks by experience. Evidently the same line of argument is being put out by its advocates in England, for we find in the London *Mining Journal* of August 17th a long and well conceived editorial, temperate, but nevertheless augumentative, which virtually takes the same ground. The editorial in question, after presenting seemingly well recognized but rather spacious arguments against bi-metallism, says:

Those nations, which are, at the present moment, endeavoring to show the advantages of bi-metallism, were the first to adopt trade protection as a panacea for the difficulties against which they had to contend, and they have not yet by any means convinced British manufacturers of the complete effectiveness of a system of reprisals. Such may be the case with bi-metallism as with protection; so with the double monetary scheme. Both are founded on laudable principles, though it must be admitted that the principle of bi-metallism has the stronger and more effective bearing upon trade. Bi-metallism, indeed, is so satisfactory in principle that the exhaustive discussion to which it has been subjected is well merited, and if, after such a careful consideration, the divergence of opinion is so evenly balanced, it may fairly be assumed that an adoption of a double system of currency is not likely to have any serious detrimental effect upon trade, but that it may possibly rectify the many disadvantages from which British commerce undoubtedly suffers. There is every reason for believing that an agitation properly conducted by the advocates of bi-metallism would have a strong effect in arousing public interest in a question that is little understood; and though perhaps unable to show the complete connection between bi-metallism and trade improvement, the perceptible influence which the one almost certainly exerts upon the other may yet be demonstrated.

The *Mining Journal* admits that English bimetallists are assuming the aggressive, and that the action which is being taken by them "to make the currency question an important factor in party politics has much greater significance than is generally imagined. This significance rests not so much upon the position which the advocates of the scheme have taken, as upon the strength of the agitation which is sure to develop after a long period of comparative quiescence. The movement has hitherto been characterized with what may be called a passive quality, when full consideration seems to have been given to every phase of the question. This, of course, is the great essential to the successful development of any scheme of such wide-spreading application as that of the double system of currency."

Such admissions as the above by a journal having so wide a reading as the London *Mining Journal* evidently enjoys, shows a slow but steady change of heart which will result in a more formidable move that must end in success for bi-metallism.

Reorganization of the Sutro Tunnel Co.

An Albany, New York, telegram received the past week reports that the Comstock Tunnel Company filed its certificate of incorporation in the Secretary of State's office on August 30th. The company has a capital of $4,000,000 divided into 2,000,000 shares at $2 a share. The company is formed for the general mining business, accumulating, conducting, selling and supplying water for mining purposes, and lands and water-power suitable for mining purposes. The incorporators are Herman R. Raltzer, Peter C. A. M. Vanweel, Eugene Seligman, and Otto Loewengred, Theodore Sutro, Gordon MacDonald and Henry E. Kavanagh are named as trustees. The headquarters of the company will be in New York, and its operations will be carried on in the town of Sutro and counties of Lyon, Storey and Washoe, Nevada.

This is nothing more or less than a reorganization of the Sutro Tunnel Company with a reduced capitalization. The new company acquires all the property rights and privileges of the old organization. The franchise granted by the United States to the Sutro Tunnel Company is one of the most valuable that could have been given any similar organization, and which, with a more thorough development of the mines at Virginia City, Nevada, ought to give the new company quite a princely income. With no incumbrancees and having a reserve capital, with a monthly income more than meeting current expenses, the Comstock Tunnel Company can and doubtless will extend their tunnel further west so as to drain the valuable lodes known to be west of the Comstock, or, as some call it, Bonanza lode. In extending the tunnel important and valuable developments are more than likely to be made. Besides extending the tunnel west, a north lateral tunnel can be or rather should be run north from a point opposite to the mouth of the south lateral tunnel that drains the Gold Hill mines. A north lateral tunnel will admit of the North End mines being worked to a better advantage, besides the probability of making important developments.

It is very generally admitted that the Comstock Tunnel Co. will commence active operations next month looking to the more thorough development of their property.

APPRECIATIVE.—The man who was sent down from this city to the U. S. of Columbia to set up and run a Dodge ore pulverizer was well treated by those who purchased the machine. They were so well pleased with his work and that of the machine that they made him a present of $1000 in addition to his pay.

AN ACID TRUST.—A dispatch from New York says: The chemical trade is much agitated over the formation of a combination of 13 acid manufacturers of New York and vicinity, which virtually controls the manufacture and sales of acid in this market and in America. Prices have already been advanced.

"No Patent, No Pay."

In addition to what was said in the PRESS of last week concerning the methods adopted by patent-selling agencies, it may be well also to call the attention of inventors to a plan adopted by certain patent-soliciting firms. Some of these people advertise extensively and hold out the tempting announcement of "no patent, no pay," which leads the inventor to believe that the firm will obtain the patent from the Government or ask no money. In the first place, the Government fees must be paid anyhow and the inventor is called upon for them; and other means are adopted for obtaining money, so that in the end the inventor pays a pretty good bill. A letter received by us this week explains what other tactics are sometimes adopted. After warning inventors against a certain firm of Washington patent agents, our correspondent says:

They advertise that they charge no fee unless a patent is allowed. The trick is this—Among the claims of the application for patent, they insert one of no importance, as, for instance, three brass tacks on a threshing machine. They allow the patent to be registered, but insist on this one claim, which, of course, is allowed, and they claim their fee. I was swindled in this way by the firm referred to four or five years ago. I paid their claim and have their receipt. Now for another swindle: Yesterday, I received a demand for this same old bill for which I hold a receipt, with a threat that if not paid by the 22d of this month, my name will be published all over the country by the U. S. Mercantile Protective Association in a *secret* circular as a delinquent debtor

The legitimate patent agents cannot conduct business in any such way, nor can they take the risks of conducting business on a contingent basis. They act as attorneys for the inventor, presenting his case properly before the Patent office, for which a suitable fee is charged. They endeavor to obtain good claims on the patents of their clients, and it is their duty to make such arguments when necessary, as will convince the officials of the justness of the claims.

The value of a patent depends largely on the claims allowed, and it needs an expert to draw these claims.

Eastern Oregon Mines.

In conversation with a prospector who has recently come from Eastern Oregon, we learn that considerable work is going on at Cracker Creek and thereabouts. Our informant thinks that it is a fine country, but there is too much stock-jobbing going on for the good of the section. The Excelsior and Eureka Co. are working 150 men. They have a 40-foot ledge, the ore in which is from two to six feet wide. The ore is rather low grade to pay under the extravigant system in which operations are being conducted. They are putting up a mill of 40 stamps, arranged to be increased to 60 for treating rebellious ores. The freight alone on the machinery from Chicago was $10,000. The owners are St. Louis people, mainly railroad men, with little knowledge of mining.

Another range of country 20 miles from Cracker Creek, in the Greenhorn mountains, is attracting great attention. The days of placer mining have gone by and capitalists are interesting themselves in quartz.

It is only of late that Eastern capital has come into the mining regions of Oregon. The Portland men have put up machinery in several places for treating free gold ores, but at a short distance in depth the ores became base and the plants would not treat it. This mistake has been frequently made.

The Bellevue, Granite Creek, is a fine mine. There is a wonderful placer country near there. The ledges are right in the heart of the mountains, where the placer gold has been found. The prospects of Eastern Oregon quartz are excellent, and unless unfortunate speculations injure them the country will prove a rich one.

BEARTOWN district is an old placer mining camp of Montana, where 15 years ago there were 3000 people. A few people are now prospecting for quartz. Among the old settlers who still reside in the camp are Roger O'Hara, Michael Kelly, John Lehsau, Chris. Cowdy, Walter Dumphey, Patrick Woodlock and a number of others.

THE Butte Miners' Union will have in the near future the finest and most complete library in Montana, and it may be said, says the *Inter-Mountain*, to the credit of W. E. Deeney and Phil Hickey, that the idea first originated in the minds of those gentlemen.

Working a Chinese Coal Mine.

(*Continued from page 181.*)

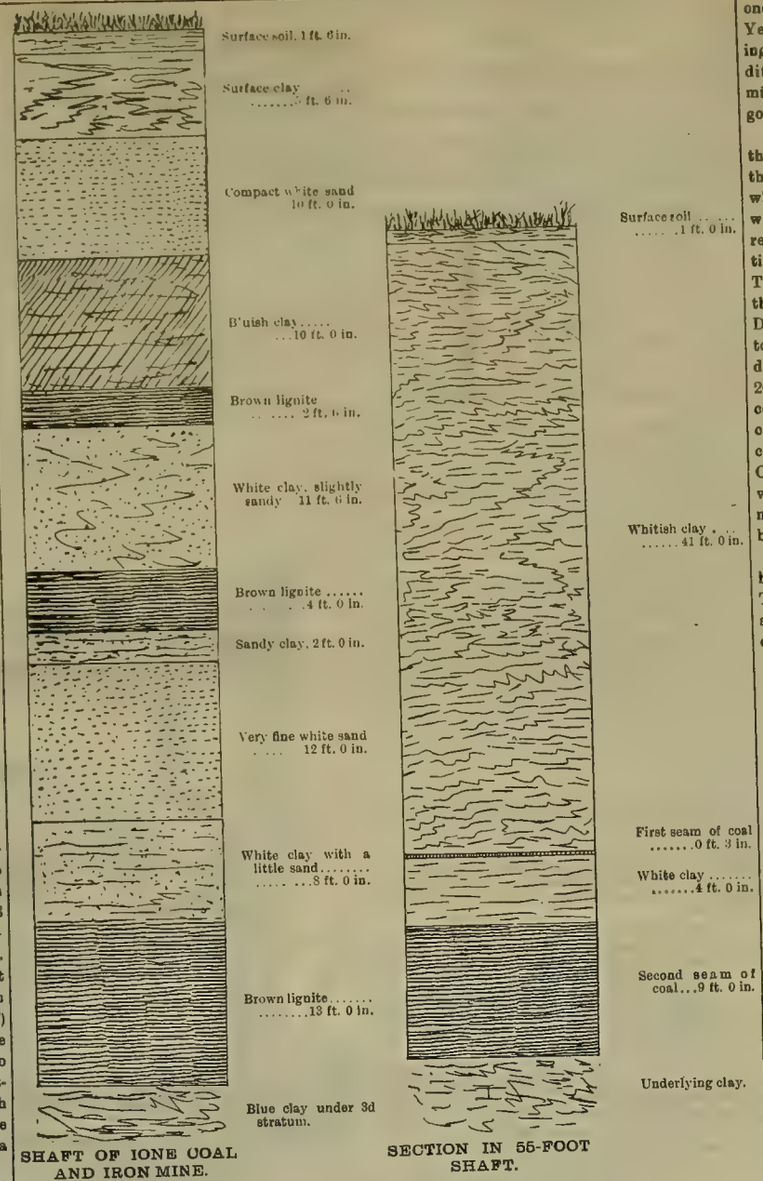
the coal is filled with dead stuff of soil, clay and stone sent down from the surface to No 1 level by self-acting packing inclines (Fig. 6) in packing-tubs which open at the sides. From the bottom of these inclines packing-tubs full of dead stuff are pushed away to the stalls and emptied into the stone shutes by special men called packers.

The coal as it is broken down is loaded into willow baskets which are put on small wagons and run to the coal shute. As the working face advances, the packing follows. Slice after slice is thus removed in ascending order. Coal shutes are constructed by building two pack-walls, 3 feet apart, and covering with 3 inch plank as seen in Fig. 11. Sending down the coal through these shutes reduces it all to dust, but the natives prefer the coal in this form.

To obtain lump-coal, self-acting inclines are made as shown in Fig. 7. The same method is applied to the working of thick seams, such as No. 12, which is 35 feet thick (Fig. 8). This is divided into five slices parallel to the stratification, which are worked off successively in ascending order like so many distinct seams of 7 feet thickness. The average cost of packing per ton of coal is 4 cents. In other coal seams this packing method is so costly that the long-wall system is employed. With this packing system very little timber is required, and the surface is preserved intact.

Haulage is accomplished solely by mules and ponies, the former costing $30 and the latter $20. Winding is done by ordinary engines and wire rope.

Fig. 2 (in last week's PRESS) shows the system of mine drainage. The water is taken to the surface in two lifts. First, the water in No. 5 seam dip-workings is hauled up to No. 3 level in water-cages by a pair of winding engines of 18-inch cylinder and 30-inch stroke. From this point (*B*) the water is lifted 260 feet to a wrought-iron tank (*C*) communicating with a stone drift (*D*) which runs into the sump (*E*) of the up-cast shaft, whence it is forced to the surface by a ram. The power consists of two differential compound engines of Davey's patent, with 50-inch high-pressure and 30 inch low-pressure cylinder. All the pump-rods are wrought iron, six inches in diameter, except a few of American pitch-pine.



The mine is ventilated by a Guibal fan of 30 feet in diameter. Candles and open lamps are used in all seams except No. 5, where safety lamps only are allowed.

The underground workmen belong to the lowest class of society; but, although ignorant, are very obedient and of a kind disposition. They possess many remarkable traits. Stealing is considered by them a virtue, and, although searched by a special staff of officers when they come out of the pit, yet they frequently manage to take away such things as bolts, fish-plates, nuts, nails, and even brattice-cloth, which they tear away from air-stoppages. In case they are caught they are not only fined for the cost of the article, but receive a punishment of 100 blows on their backs.

The Chinese miners wash themselves only once a year. This annual ablution is for New Year's, when they dress up in their fine clothing and receive and make visits. It would be difficult for a stranger at first sight to determine whether the miner belonged to the Mongolian or African race.

The men are very fond of sleeping when they ought to be at work. If one is caught in this condition, and after being awakened, asked why he is not working instead of sleeping, he will face the overseer with a grin and calmly reply that he was not sleeping at all, but was tired and merely sat down to rest himself. The Chinese miners are somewhat superstitious; they believe in evil spirits and bad omens. Daily wages are paid as follows: Interpreters to foreign overmen, 20 cents; pony and mule drivers, 20 cents; sinkers, 20 cents; masons, 20 cents; enginemen, 20 cents; coal miners, 15 cents; door-boys, 13 cents; switch-boys, 13 cents; drain-boys, 13 cents; drum-boys, 13 cents; Cantonese boatswains or pumpmen, $1; Chinese pit deputies, $1. These wages seem very low, but it must be considered that the men do only one-fourth the work accomplished by English miners.

The daily output of coal is 950 tons, which is hauled up in two shifts of eight hours each. The coal is sold for from $4.20 to $8.40 per ton, according to quality, the dust bringing the lowest figure and the lump the highest.

SHAFT OF IONE COAL AND IRON MINE. SECTION IN 55-FOOT SHAFT.

FIG. 11.

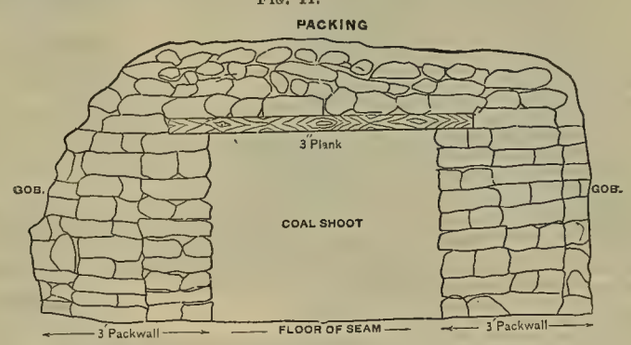


FIG. 10.

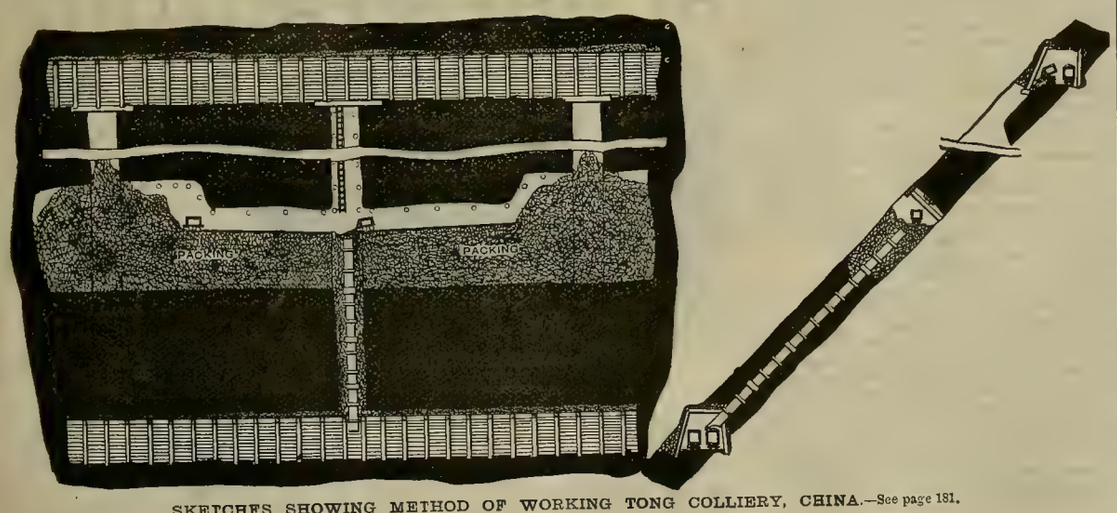
Amador County Lignite.

In Amador county, in this State, a brown lignite is found in several localities. In the Ione and Buckeye valleys considerable work has been done, especially by the Ione Coal & Iron Co. The cut given herewith shows the different strata encountered on a depth of 80 feet. Underneath the lower stratum of coal lies a dark-bluish, sandy loam. This stratum has been penetrated in two places, by boring, to a depth of 600 feet—one in Buckeye valley and one in Ione valley. This formation was not passed entirely through, notwithstanding so great a depth was attained. No water was encountered in either exploration. Specks of coal were found, here and there, scattered through the clay for 20 feet below the lower stratum of coal than these indications of the proximity of coal-beds ceased altogether, and the material passed through to deepest depths attained was a mixture of dry clay and sand; but bedrock proper was not reached below the third stratum of coal, in either Ione or Buckeye valleys. In regard to the coal of Amador county, it may be said that it belongs to the later pliocene, the same age as the lignite occasionally found in seams of the auriferous gravel underlying basaltic lava in several counties.



The Sacramento and Ione Coal Co., in Ione valley, have 132 acres of coal land, with mining equipments. The coal-bunkers are connected by side-track with the Ione branch railroad. The mine has been operated some 13 years. The developments consist of a main incline having a southerly slope of one-half inch in one foot for 500 feet; a main drift through the coal 800 feet, and exploration on the east side for 1000 feet, one a shaft 75 feet deep, the second air shaft 54 feet deep, connecting with the main drift 1000 feet southeasterly from the mouth of the incline. In this mine two coal strata occur. The upper one, three feet above the lower one, has an average thickness of eight inches. The lower one, varying in thickness from 6 feet to 24 feet, is separated from the upper and smaller stratum by three feet of brownish-white clay. Below the lower stratum of coal there is always found white clay.

From 6 to 12 feet of thickness of coal, which is the better partion, is extracted. As in the other coal mine near Ione, no powder is employed. No hoisting works are needed, but mules are employed to bring the coal up the slight incline (which may be considered more of a tunnel than an inclined shaft), in cars holding an average weight of 1600 pounds. One side of the mine is worked at a time. The other side is simply blocked out and left standing, that the coal, when moved, may contain less water.

The same prices obtained for this coal as for that of the other producting mine: $1.50 per ton for that which in more finely broken and $2 for "lump," or house coal. The usual yield of this mine is 70 tons per day, and the coal is sold as fast as extracted.

There is very little water in this mine, even

METHOD OF WORKING STALLS, TONG COLLIERY.

SKETCHES SHOWING METHOD OF WORKING TONG COLLIERY, CHINA.—See page 181.

during the rainy season. No legging is used in the mine, and no other timber is required than posts and single caps. These caps are usually 4x6 inches and 18 inches long. The timber for posts is of all kinds, and anything is taken that may be conveniently found on the ranch.

The contractor mines and delivers the coal into bunkers near the railroad switch for 75 cents per ton, and furnishes labor, tools, oil and mules. He employs about 20 men and boys, at rates from $2.50 to $1.50 per day. One man is employed on the day shift at $3.50 and one at night for $3.

The coal is mined in blocks 15 feet square and 6 to 12 feet thick. After blocking out into squares each alternate square is taken, commencing at the soft coal on the outer rim of the basin; then the alternate pillars which were left are removed, and in their stead are placed posts and single caps, about four feet apart. The ground is then allowed to cave. In this way all the coal of suitable grade is removed.

The 75 foot shaft passes through 2 feet 4 inches of surface soil and gravel; 44 feet of white clay; 8 inches of the first stratum of coal; 4 feet of brownish clay with no grit; and 24 feet of the second stratum of coal. The white, sandy clay below the coal was penetrated 10 feet. The 54-foot shaft, connecting with the main drift, passed through the strata shown in the accompanying cut, which, with description, is taken from the State Mineralogist's report.

As an illustration of the comparative cheapness of shafts sunk in this formation, for air or pumping purposes, it may be mentioned that this 54-foot shaft was sunk for $50, and an offer was made, but not taken, to sink one a hundred feet deep for $75. The refusal of the offer was based on the opinion that too much was asked for the work contemplated. The cost of the 54-foot shaft may be estimated as the cost of sinking a like number of feet anywhere in this formation.

Mining Bureau Appointments.

Up to this week no field work has been done this fiscal year by the State Mining Bureau, owing to the appropriation having been withheld by the State Controller on technical grounds. A decision of the Supreme Court has, however, made the money available, and on Tuesday a meeting of the trustees of the bureau was held, and the following appointments made with the advice of the State Mineralogist:

W. A. Goodyear, geologist in chief (reappointed).
H. L. Watts, assistant geologist (reappointed).
H. J. Willey, engineer in chief of topographical and geological work.
J. H. Crossman, engineer of mines and field assistant (reappointed).
Adolph Webber, field assistant.
John Hayes Hammond, mining engineer and mining inspector (reappointed).
W. H. Webb, expert on mining machinery.
E. B. Preston, mining engineer and geologist.
Professor Ross E. Brown, civil and mining engineer.
Dr. W. D. Johnson, chief chemist of the mineralogical and metallurgical department.
Professor C. A. Ogden, assistant chemist (reappointed).
Carl Schneider, mineralogist and crystallographer (reappointed).
H. T. Durdeen, custodian of the museum and acting secretary (reappointed).
Miss Maggie Maynard, librarian (reappointed).
W. Ellingswood, janitor (reappointed).

State Mineralogist Irelan, though annoyed at the delay, intends to accomplish as much as possible during the season, and will immediately start his assistants out in the field. The appropriation amounts to $100,000, of which $70,000 is to be extended in field work.

ANTI-DEBRIS ASSOCIATION.—An Associated Press dispatch, dated Marysville, Aug. 31st, says: The annual meeting of the Anti-Debris Association of the Sacramento Valley was held in Yuba City to-day. The former officers were re-elected, namely: Pres., C. E. Stone; Manager, Geo. Ohleyer; Sec., B. F. Walton. The directors' report of the business showed a gratifying condition of affairs. Very little illicit mining has been done during the past year, and that little under the claim of restraint of debris behind dams. The Government of the United States has largely removed the burden of litigation from the shoulders of the association, and at the present time only the agent of the association is kept traveling in the mountains, but the meeting resolved to maintain the organization and to take whatever further steps may be found necessary to complete the object of the association.

Mining Personals.

J. H. Barfeind is now in charge of the Bear's Nest mine, Alaska.

H. N. Palmer has tendered his resignation to the Congress Mining Co., A. T.

Benjamin Harrison is superintendent of the Pacific mine, Pinos Altos, N. M.

Frank Drake and Jno. Applegarth, mining men from Mexico, are in the city.

Isaac M. Taylor, the mine operator well known all over this coast, is in New York.

Chas. F. Hoffman, superintendent of the French Co.'s mines at Red Point, is in town.

Wm. Metcalf of Nelson Point is superintendent of the Bunker Hill Con. mine, Plumas county.

Mr. E. C. Van Blarcom, M. E., is in charge at the Hacienda de San Francisco, Pachuca, Mexico.

F. F. Coffin, superintendent of the Grand Prize and other Tuscarora mines, is visiting in this city.

R. S. Raw is superintendent of the Independence quartz mine, west of Placerville, El Dorado county.

H. H. Shorkley, superintendent of the Mt. Diablo mine, has gone back to Candelaria after a visit to the city.

E. T. Stoughton reports considerable prospecting being done in Silver Star district, Jefferson county, M. T.

J. A. Morehead is in charge of the development work on the Carson claim, belonging to a Kansas City Co., Pinos Altos, N. M.

Chas. E. Elliott and Chas. Hirschfeld have gone to Sierra City to look after some mining property they are interested in there.

Alvinza Hayward and W. P. Hobart left for Mexico on Thursday of last week to examine some mines there in which they are interested.

S. B. Christy, professor of mining and metallurgy of the University, is at New Almaden, studying up the geology of that quicksilver region.

George Arnott of Brandy City, Sierra Co., where he has for a long time been engaged in hydraulic mining, has gone to Scotland on a visit.

Gen. K. P. Keating, superintendent of the Savage, Hale and Norcrose, and Scorpion mines, has returned to Virginia City, after a visit to this city.

Jesse L. Pritchard of Denver has been examining properties in Gold Hill, N. M. Harry Fowler of Silver City, N. M., is putting up a five-stamp mill at Central.

Jacob Neff is superintendent of the Morning Star mine, Iowa Hill, Placer Co. The gravel extracted averages $6.33 per carload, and the mine is in a prosperous condition.

J. Waller, until recently a miner and prospector in Colorado, is the discoverer of a new mine called the Little Daisy, Carpenter Gulch, four miles from Blackfoot City, M. T.

James Cross, who has been superintending mines for the Mariposa syndicate, composed of John W. Mackay, John P. Jones, Alvinza Hayward and W. S. Hobart, is in the city on a visit.

William Fries, president of the Eureka Consolidated mine, has returned to the city from Eureka. He reports that the smelting works were started a week ago, and a telegram announced that the new refinery started Tuesday. There are about 1000 tons of ore and 1500 tons of speiss on hand, which will be worked.

John, Charles and Wm. Carveth, Richard and Thomas Veale and John Gill, miners from the Sierra Buttes mine (and members of the Sierra Buttes brass band) are among those who have left Sierra City. They have gone to the Granite Mountain mine, Deer Lodge county, Montana, where they have steady work at $3.50 per day.

Frank S. Bryant is superintendent of the Spanish R. M. Co., Deadwood, Dakota. The report made by Superintendent Bryant of the outlook and prospects at the mine were flattering. A vote of thanks was passed by the stockholders on the efficient manner in which the affairs of the company have been conducted for the year ending Aug. 27, 1889.

The Oroville *Register* says: Three old-time miners met the other day at the Perkins & Gallagher mine. They were L. A. Snow, E. W. Slater and Chas. Retson. The same three worked together at Bidwell Bar over 35 years ago. Retson has drifted off to stock-raising and farming, while Messrs. Snow and Slater still follow their occupation of so many years ago.

Superintendent R. K. Colcord has returned to Aurora from London, where he has been on business connected with the company he represents. It is stated for a fact, says the Walker Lake *Bulletin*, that he has a credit of $300,000, English money, to be devoted to the development of mines. This will help make Aurora a live camp for some time, and perhaps establish it permanently as a mining town.

Mr. D. C. Probasco passed through San Francisco last week from Oregon on his way to Inyo county. He had some idea of going to the South African gold fields, but the reports received were unfavorable. Mr. Probasco has been a prospector for many years, all over the coast. He says he has met many good prospectors who prefer California to any part of the northwest. There are better chances in this State, and if good prospects are struck, there are better opportunities to sell. The climate, too, is favorable for work at all seasons. Several prospectors returned from Oregon on the same steamer intending to strike out for the mountains in the State.

NEW SOUTH WALES.

THE GOVERNMENT OF NEW SOUTH WALES intends to establish METALLURGICAL WORKS on a scale sufficiently large for determining, in bulk, the best methods of treating Ores produced in the Colony.

A SUPERINTENDENT is REQUIRED to erect, control and direct these Works. He must possess the highest qualifications and widest experience, and it will be his duty to introduce the best methods of treating Ores (especially Auriferous and Argentiferous) with a view to extract therefrom the metals and other substances possessing an economic value. He would also have to impart full instruction in the various methods of treatment, and to afford every facility to Smelters and Miners for acquiring a practical knowledge of the processes employed.

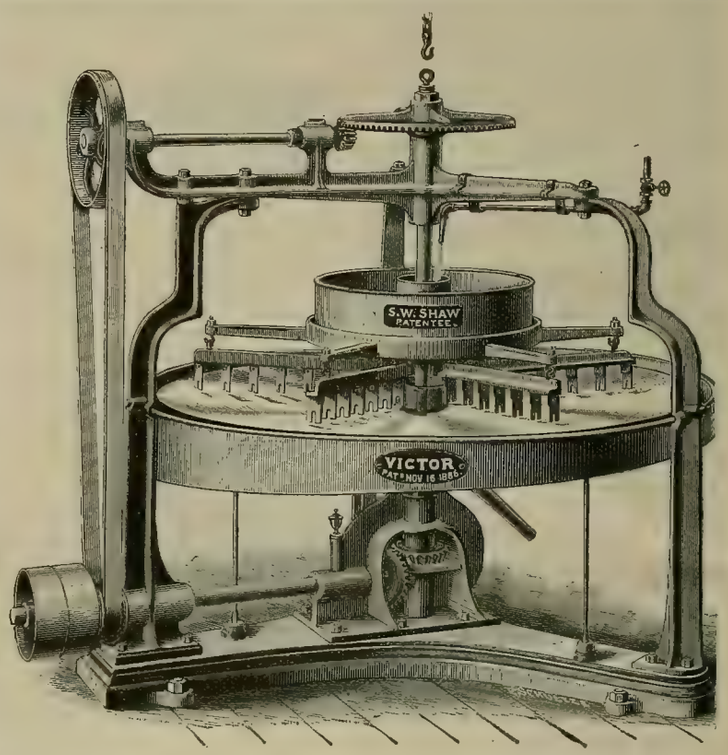
Applications, stating candidate's age, salary required, and accompanied by copies of testimonials, must be sent, on or before the 25th of September, 1889, to The Agent-General for New South Wales, 5, Westminster Chambers, London, S. W. SAUL SAMUEL,
7th August, 1889. Agent-General for New South Wales.

WANTED!

A partner with capital to run in a tunnel and develop a large and valuable sulphuret claim; one of the best locations in the State. Full particulars given. Address, "C. H. C.," Box 2517, San Francisco, Cal.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.



ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & Co., S. F.

"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address H. L. DENIO, Upper Lake.

THE VICTOR CONCENTRATOR

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,
17 and 19 Fremont Street, SAN FRANCISCO.

RUBBER FACTORY.

Monarch Belting.

The Plies of this Belt are
UNITED by COTTON RIVETS
Which hold them firmly together.
Each Rivet is Independent
And Follows the Stretch.
THERE ARE NO STITCHES
TO BREAK, and
The Belt has a Smooth Surface.

Hose, Belting, Packing, Etc.

ALL KINDS OF RUBBER GOODS MADE TO ORDER IN A FEW HOURS.

24th Industrial Exposition
— OF THE —
MECHANICS' INSTITUTE
Opens Aug. 27th, Closes Oct. 5th.

The Departments of Science, Art and Industry will be fully represented by Machinery, Invention, Processes, Paintings, Statuary, the Camera, Manufactured and Natural Products.
The First Infantry Band of 44 performers, CHAS. S. CASASSA, leader, with the world renowned artists and solo contestists, MISS MARIE McNEIL and A. H. KNOLL, will render each afternoon and evening a grand instrumental concert of classical and popular music.

ADMISSION:

Double Season Ticket, admitting two persons	$5 00
Single Season Ticket	3 00
Child's Season Ticket	1 50
Adult Single Ticket	50
Child's Single Ticket	25

Season Tickets to members of the Institute, half rate. DAVID KERR, President.
A. W. STARBIRD, Recording Secretary.

FOR SALE.
One Set Hoisting Machinery and Two Boilers.

Engines 10"x 12" with Corliss frame. Two Reels 4 ft.x 30 in.; cog gear. Everything complete for rapid and efficient work. Machinery built by National iron Works.
Boilers 48"x 16'. One with 3½", the other 3" tubes. In good repair, built by Wm. McAffee, of best iron in use. Will sell cheap for cash. Inquire of
ETNA Q. M. CO., Lidell, Napa Co.
or DANIEL MEYER, 212 Pine St., S. F.

Assessment Notices.

ASSESSMENT NOTICE.

California & Nevada Railroad Company.—Location of principal place of business, San Francisco, California. Location of Railroad, Alameda County, California.
NOTICE is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1889, an assessment, No 1, of Fifty Cents per share was levied upon the Capital Stock of the corporation, payable immediately in United States Gold Coin to the Secretary at the office of the Company, Room 12, No. 320 California Street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 20th day of September, 1889, will be delinquent and advertised of sale at public auction, and unless payment is made before, will be sold on Monday, October 14th, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Directors.
E. A. PHELPS, Secretary.
Office, Room 12, No. 320 California Street, San Francisco, California.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of Principal place of Business, San Francisco, California. Location of Works, Placer County, California.
NOTICE is hereby given that at a meeting of the Board of Directors, held on the 13th day of August, 1889, an assessment, No. 14, of Four Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, 327 Pine Street, Room 9, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 16th day of September, 1889, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 8th day of October, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
O. H. BOGART, Secretary.
Office, 327 Pine Street, Room 9, San Francisco, Cal.

—THE—
PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.
We manufacture, to go with the Mill, an
IMPROVED ROCK BREAKER.
Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

410,062. — CABLE RAILWAY CROSSING — G. H. Wright, S. F.

The following brief list by telegraph, for Sept. 3d will appear more complete on receipt of mail advices:

California—Walker C. Taylor, San Francisco, merry-go-round; Edward A. Rix, San Francisco, rock drill; Ernest L. Ransome, San Francisco, concrete-mixing machine; Parker J. Pierce, assignor of half to R. P. M. Greely, Oakland, cuspidor; James M. Jameson, Los Angeles, device for burning brick; David B. James, San Francisco, miner's candle-stick; Frederick W. Cook, assignor of half to H. P. Gregory & Co., San Francisco, gang-edger; Joseph S. Chadbourne and L. C. Stuckey, Rosamond, railway rail joint; Daniel Best, San Leandro, combined harvester and thrasher.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FIRE-LADDER TRUCK. — John E. Furry, Stockton, No. 409,835. Dated Aug. 27, 1889. This is one of that class of fire-ladder trucks in which the main ladder is hinged to a turn-table and is adapted to be raised by suitable power-transmitting mechanism. The invention consists in the novel manner of mounting the ladder, the novel mechanism for raising and lowering it and the mechanism for turning it to the required position. The object is to provide a simple arrangement for handling the main ladder of a fire-truck, one man only being required to manipulate it, both to raise and lower it and to turn it to required position.

SCHOOL DESK.—Charles B. Towle, Vallejo, Solano Co. No. 409,884. Dated Aug. 27, 1889. The objects of this invention are to provide simple, effective and accurate connections between the sliding and the fixed top of the desk, whereby a suitable space may be formed between the two tops, and whereby the former may be readily moved and limited in its movement; to provide a simple seat connection whereby the seat may be raised and lowered; to provide suitable connections for the foot-rest whereby said foot-rest may be readily put in place and adjusted to different positions and to different angles; and to provide a simple seat hinge.

SAFETY-GUARD FOR CARS.—Chas. H. Ohm, San Francisco, No. 409,861. Dated Aug. 27, 1889. This is a protective device to be applied to the front of cable railroad cars to prevent persons and things from being carried beneath the wheels. The essential feature of this invention is a swivelled roller-guard so suspended that if a body comes in contact with it it will turn from one side or the other so that the frictional contact of the body, which is still resting upon the ground, will cause the rollers to act upon it and force it off to one side and away from the car-wheels, while at the same time the secondary guard or scraper will be thrown down into such close contact with the track and road-bed as to prevent anything passing beneath it.

THREAD CONTROLLED STOP MECHANISM FOR SEWING MACHINES.—Albert J. Hart, S. F. No. 409,963. Dated Aug. 27, 1889. This invention relates to the mechanisms of sewing machines for stopping the motion of the machine, and dependent for their operation upon the breaking of the thread, whereby the result is automatically effected. The invention consists in a movable trip-rod held in one position normally by the thread when taut, and allowed to drop when the thread is broken; a belt-shifting arm directing the power belt and adapted to throw it from a fast to a loose pulley; a spring-controlled sliding bar carrying the belt-shifting arm and a locking lever for holding the sliding bar in position when the machine is in operation, said lever being released by the trip-rod when dropped upon the breaking of the thread; and the invention further consists in connection with the belt-shifting arm of a brake attachment adapted to come into frictional contact with the fast pulley, whereby it checks its momentum instantly. This provides a simple and effective mechanism for automatically stopping the motion of a sewing machine upon the breaking of the thread.

WATER-WHEEL.—L. A. Pelton, Nevada City, assignor to A. P. Brayton, Jr., San Francisco. No. 409,865. Dated Aug. 27, 1889. This is an improvement on the well-known Pelton wheel. The invention consists essentially in a novel construction of the buckets into which the water is discharged so that the stream of water is divided into two parts by a central ridge or apex which directs the current of water into the curved bottom of the two halves of the bucket, from which it passes out over the flaring or diverging sides of the bucket so as to escape smoothly and utilize the full reactionary force of the escaping stream in addition to the direct force of the impinging jet. The object of the improvement is to provide a series of buckets to be attached to the periphery of water-wheel, these buckets being of such construction as to utilize to its highest degree, first, the direct impact of the column of water which is discharged into them with great velocity from the nozzle, and, secondly, to utilize in a similar manner the full reactionary force caused by the change of direction of the column of water and its perfect discharge and clearance from the wheel, so that no portion of it acts to impede the wheel by contact with the following buckets or any other portion of the wheel.

Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

FREEMAN'S DRY WASHER is attracting considerable attention at the Mechanic's Fair. A public test was made on Monday last which was very satisfactory. We have described this machine in detail in the PRESS, and since that a number have been put at work in the dry placers on different parts of this coast.

DODGE, NOT HUNTINGTON. — The Amador county papers persist in calling the ore pulverizer at work at the French, or Cleveland mine, a Huntington mill, whereas it is a pulverizer of the Dodge patent.

THE town of Barker, the business center of Barker mining district, Montana, has been almost totally destroyed by fire.

E. E. EYRE, President. JAS. H. GRAHAM, Vice-Pres. & Manager. G. M. PINCKARD, Sec'y.

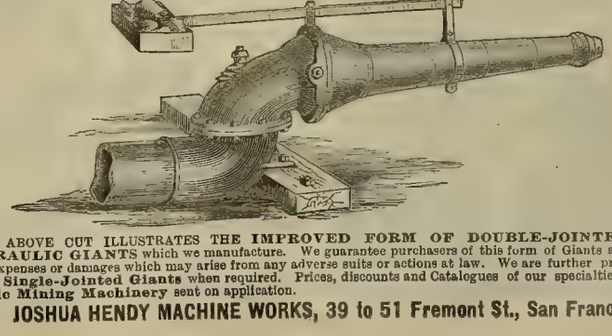
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.



OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

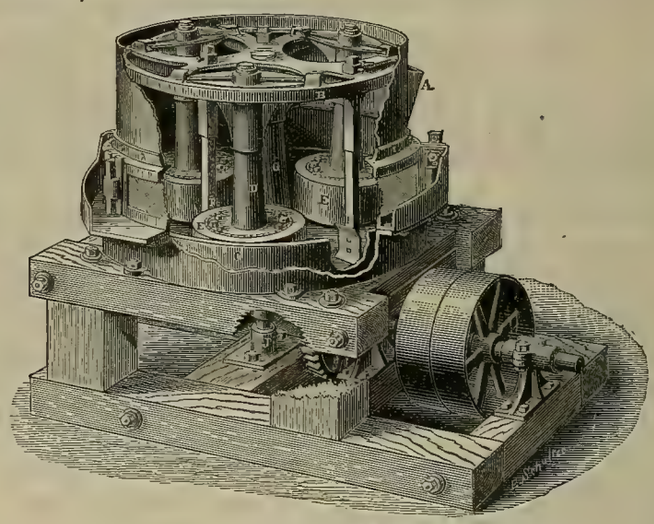
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 213 FIRST STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaptation of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

FREEMAN'S
Dry Process
GOLD SEPARATOR.

They are good machines. If the gold is in the dirt they will save it. They will save finer gold than water will.

T. J. SCOTT,
Osceola, Nevada.

Smith & Drew took out Tuesday, in their dry wash diggings, in addition to 5 ozs. of fine gold, a nugget weighing 22 ozs. The machine used was Freeman's Dry Process Separator.—*Utah Daily Union, May 10, 1889.*

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 5, 1889.

General trade continues fair, but the volume of goods going out is disappointingly small for the season of the year; yet this is to be expected as transportation facilities improve so as to admit of assorting buying the year round. Merchants still complain of poor collections, but freer remittances are looked for in the near future. Manufacturers and iron-workers in general report a fairly active business in their particular lines.

The local money market is easy, with no marked call for funds. The first installment of money from Australia, mentioned by this paper in July last, came to hand the past week. The shipment aggregated $5,000,000, which went into the mint for recoinage. The money is sent here for exchange purposes on grain purchases, and will do no little in keeping our money market easy throughout the months when the demand is the heaviest for funds to move the grain crops. For speculative purposes there is only a moderate call for money. The only movement that now promises any inducements for an active speculative campaign is that of wheat and barley. Local securities, unless we except Spring Valley stock, are too high for dealers. Mining stocks appear to be getting into shape for an active bull campaign, which would draw in outside speculators.

The coinage of the San Francisco Mint in last month was as follows: Double eagles, $2,000,000; eagles, $630,000; total, $639,000.

The London silver market for August showed an irregular tendency. The opening price was 42¾d for British standard ounce 925 fine. The price rose to 42¾d, then dropped to 42¾d, but rose irregularly to 42 9-16d on the 30th, and closed at 42½d. The extremes for each month this year have been as follows:

	Highest.	Lowest.
January	42 11-16d	42 6-16d
February	42 12-16	42 8-16
March	42 9-16	42 4-16
April	42 5-16	42 2-16
May	42 4-16	41 15-16
June	42 4-16	42 0
July	42 5-16	42 0
August	42 9-16	42 3-16

The extremes for August, 1888, were 42 2-16d and 41 15-16d, and for the eight months 44 11-16d to 41⅝d.

S. H. Brooks, Assistant Treasurer United States at San Francisco, reports cash on hand Aug. 31, 1889, as follows:

United States notes	$95,272 00
National Bank notes	20,075 00
Gold certificates	4,560 00
Silver certificates	107,465 00
Gold coin	39,364,371 50
Standard silver dollars	17,992,241 00
Fractional silver	6,578,746 75
Minor coin	3,319 59
Total	$64,166,050 84

The shipments of silver from the Sub-Treasury into the interior of the State and elsewhere for the month were as follows:

Standard dollars	$238,130 00
Fractional silver	100,280 00
Total	$338,410 00

MEXICAN DOLLARS—The market was held fairly strong throughout the past week at 74¾c to 74½c. The demand is fairly good. The steamer leaving here on last Saturday for China took out for Hongkong $250,030 and to Japan $5000. Total, $255,030.

SILVER—The market was held strong throughout the week. On last Friday the highest point was reached; since then the price shaded off some. The last sale reported was made at 93¾c, although holders ask more money. The Nevada bank was in the market for last steamer; their purchases went forward to Shanghai. The supply of silver bullion on this coast is light, which causes our market to rule from three-fourths to one cent an ounce above New York quotations. It now looks as if the supply from the Comstock mines will continue small, as all indications point to new developments being mostly gold. The steamer hence, Aug. 31st, for China, took out bullion as follows: For Hongkong, $122,000; Japan, $41,000; Shanghai, $49,592. Total, $212,592.

QUICKSILVER—Receipts the past week aggregate 394 flasks and the shipments by sea, 90 flasks to Mexico. The market has an easier tone. The call is still quiet.

BORAX—Receipts the past week aggregate 873 ctls., and the shipments 4013 ctls. to New York. The market is firm at full prices, with the East buying freely.

LIME—Receipts aggregate 5084 bbls. The export movements continue small, but the home demand is still free.

TIN—Exports by sea the first week aggregate 30,000 pounds to Victoria, B. C. The market for spot parcels is quiet with an easy tone reported by buyers. For shipment the market is very strong at full prices.

COPPER—A shipment of 18 bars was made the past week to Hamburg. The market both at the East and abroad continues to shape itself in sellers' favor.

IRON—The spot market has a firmer tone, with present indications pointing to an advance in the near future. For shipment no orders can be filled except at a marked advance on spot quotations. The market abroad has advanced to figures that necessitate caution. At the East there is an improved market.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow.	Aug. 28, '89.	Aug. 21, '89.
No 1 Coltness	61s	60s
" Langloan	59s 6d	58s 6d
" Summerlee	59s 9d	58s 6d
" Gartsherrie	58s 6d	57s
At Ardrossa.		
No. 1 Eglinton	47s 6d	47s 6d
" Glengarnock	56s	55s
" Dalmellington	49s	49s 6d

COKE—Imports the past week aggregated 1000 tons from Australia. The market with us is without change. It is claimed that concessions can be had from consumers who have large supplies on hand.

COAL—Imports the past week aggregate as follows: Australia, 11,656 tons; Nanaimo, 2336; Coos Bay, 1215; Seattle, 5950; Departure Bay, 3782; Union Bay, 4300; Tacoma, 2000; total, 31,190 tons. Although imports the past week show an increase, yet the market is reported very strong at full prices. The scarcity of ships at all supply ports is against buyers. The demand is reported by importers and agents to be increasing. The coast collieries are said to be increasing their output under the impression that the market will probably do better.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Sept. 4, 1889.—The following are the closing prices the past week:

	Silver in London.	New York.	Copper.	Lead.	Tin.
Thursday	42½	92½	$12 00	$3 85	$20 50
Friday	42 9-16	92⅜	12 00	3 87½	20 50
Saturday	42⅜	92⅜	12 00	3 90	20 50
Monday	42⅜	....	....	....	....
Tuesday	42⅜	92½	12 00	3 95	20 50
Wednesday	42⅜	92½	12 00	4 00	20 55

NEW YORK, Sept. 4.—Quicksilver is easier. Borax is firmly held with a good demand. The copper combination maintains its views to an extent that supports $12 for Lake Superior, $11.50 Montana and Arizona. Casting brands $10.50 to sell. Pig lead strong at $3.97½@$4, with sales about 400 tons per week.

Mining Share Market.

As intimated in last week's issue the pool made the smaller shorts on the Comstocks fill by a slight upward turn in prices; after which the market sagged off up to Wednesday, when a strong bear raid was made on the north end stocks. One firm alone put out over 3000 shares, while others put out smaller quantities. After the tone of the market became unmistakably weak by having absorbed all the stock possible, a broker who is reported to be acting for the pool, commenced offering stocks, when a scramble from outside holders and the raid set in to get out. Who bought the stock is a problem, for outsiders who have faith in the situation were well loaded up and could take no more, while others who have either been acting on the bear side or else not doing anything, seemingly watching for developments, were not purchasers. There is no doubt but the work now going on in the Middle, Gold Hill and Alta group of mines is of a very interesting character, and that important ore bodies or lodes known to the best recognized mining experts are liable to be run into within a short time. In outside stocks trading was fair in the Quijotoas and Bodies at a slight advance, but which was soon lost. Report has it that the Quijotoas, which are the most economically managed mines listed on the two exchanges, are to have another line of assessment in the near future. The Bodie 50-cent assessment has not been levied, but instead a report of a strike in Mono was put out, but which our advices so far fail to confirm. The Tuscaroras are lifeless and unattractive, pending some kind of improvements in the mills and active prospecting work in the mines.

Col. John W. Mackay is expected back from the East soon. It is said that it has always been his custom to be here at the annual meeting of Con. Virginia, which is held on the second Monday of October. This year it is intimated by one or two persons who ought to know that there may possibly be a contest for the control of the mine. So far the market acts as if there are grounds for the rumor, but like all else, time will tell if the report is correct.

The market for the Comstocks opened this (Thursday) morning at lower prices. After the regular session prices were a shade firmer. The market indicates that the pool is shaping things for another upward move, probably by the time this paper reaches our patrons it may have commenced, and this, too, in the face of reports of assessments to be levied soon. Outside stocks continue inactive.

Private, but reliable, information from the Comstock mines report that the west crosscut on the 500-foot level in Yellow Jacket is in 575 feet, and is being vigorously pushed forward so as to cut the gold ledge lying to the west. A crosscut on the same level in Challenge is in 120 feet. Con. Imperial north drift, continuation of the 500-foot level from the Yellow Jacket shaft, is close to the Alpha line. The Alpha shaft is being sunk below the 500-foot level to get deeper on the ledge cut on the 500-foot level to the west. In Potosi they are still stripping the ledge on the 700-foot level at the south end of the mine. The Ward shaft is opened to the 1700-foot level. In Crown Point they have found favorable indications of the ledge pitching west on the 400-foot level. This is important, as the ledge is much flatter and further west than the management had expected. Belcher is upraising from the 1200-foot level in low-grade ore. On the 200-foot level they are crosscutting now in quartz and porphyry. The north drift from crosscut No. 1 in Mexican is in over 300 feet with no improvement reported so far. In the Gould and Curry and Best and Belcher drifts there is nothing new to report. In Savage they are finding on the 300-foot level ore west of the water encountered last week. In Hale and Norcross on the 300-foot level they are ready to commence crosscutting from the Savage to Chollar line. From the outside mines, Bodies, Tuscaroras, and Quijotoas there is nothing new to report from trustworthy sources.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

IT is stated that a vein of cannel coal of superior quality has been discovered within 20 miles of Ellensburg. The vein is about nine feet thick and the first of the kind found in Washington.

At the last meeting of the California Academy of Sciences on Monday evening last, the Academy was addressed by Dr. George Vasey, Botanist of the Agricultural Department at Washington.

Robert Tait, an old-time millwright of Butte, is about to construct a 20-stamp mill on the Champion, near Deer Lodge.

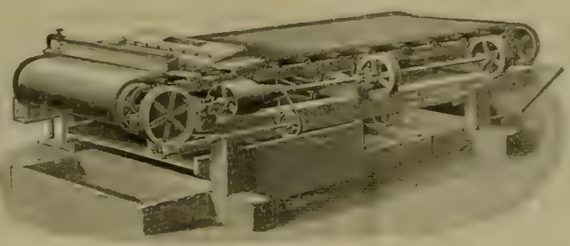
The above Hotel is situated in the midst of the Banking and Commercial Houses of the city, and is by far the most home-like and desirable Hotel to stop at.

CHAS. & WM. MONTGOMERY, Prop'rs.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.



This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 290 Market St., San Francisco.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

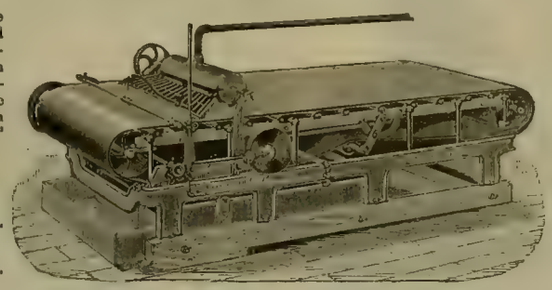
There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.



The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanner or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Pan Amalgamation.

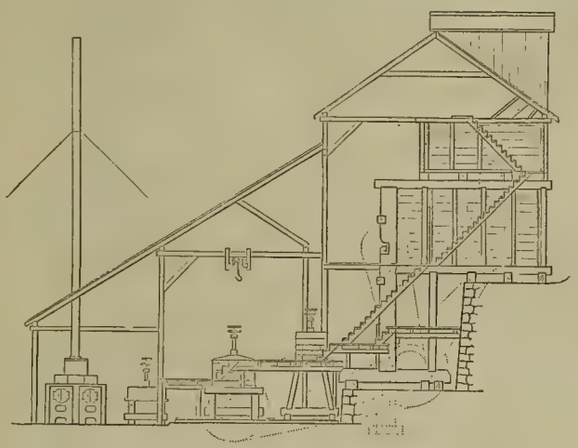
The Boss Continuous Process.

In early pan practice it was thought absolutely necessary in amalgamation that the pulp should be very thick—so thick that at its surface the movement was slow and the quicksilver rolled leisurely along with it in great shining beads. Nor was this belief at that time incorrect, for the pans of that period were not suitable for treating thin pulp. Close attention was required of the millman upon this point, or his percentage suffered.

As improvements followed and the pan developed it was found that the quicksilver could be carried in minute globules throughout the pulp in far more intimate and rapid contact of particles by thin charges when the pulp currents were sufficiently strong and systematic, and that with these thinner charges the efficiency of the pan increased and less motive-power was required.

Having acquired this knowledge from practice, Mr. M. P. Boss became imbued with the idea of discarding the tanks and the practice of working the pans by charges, and developed what is now so well known as his "continuous system."

Beginning with the battery, it was found that the use of water in such excess as had been customary was unnecessary; that by using a coarser screen and reducing the water to give the same output the fineness of crushed pulp was practically the same. A battery in this manner gave a properly thin pulp for panning. The pulp from the battery flows direct to the first of a line or system of pans. The first pan when full overflows into the second, the second into the third, etc., throughout the series. From the pans the pulp flows through a series of settlers in the same manner, thus passing through the mill automatically.



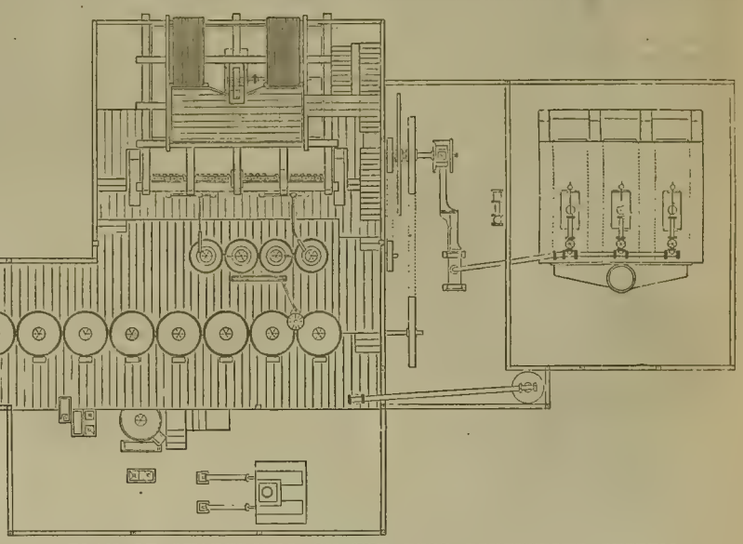
The pulp may before amalgamation pass through a series of special grinding pans, or it may be ground in the first pan or pans of the regular series.

The preparatory chemical treatment is applied by automatic feeders to the first or near the first of the regular pans.

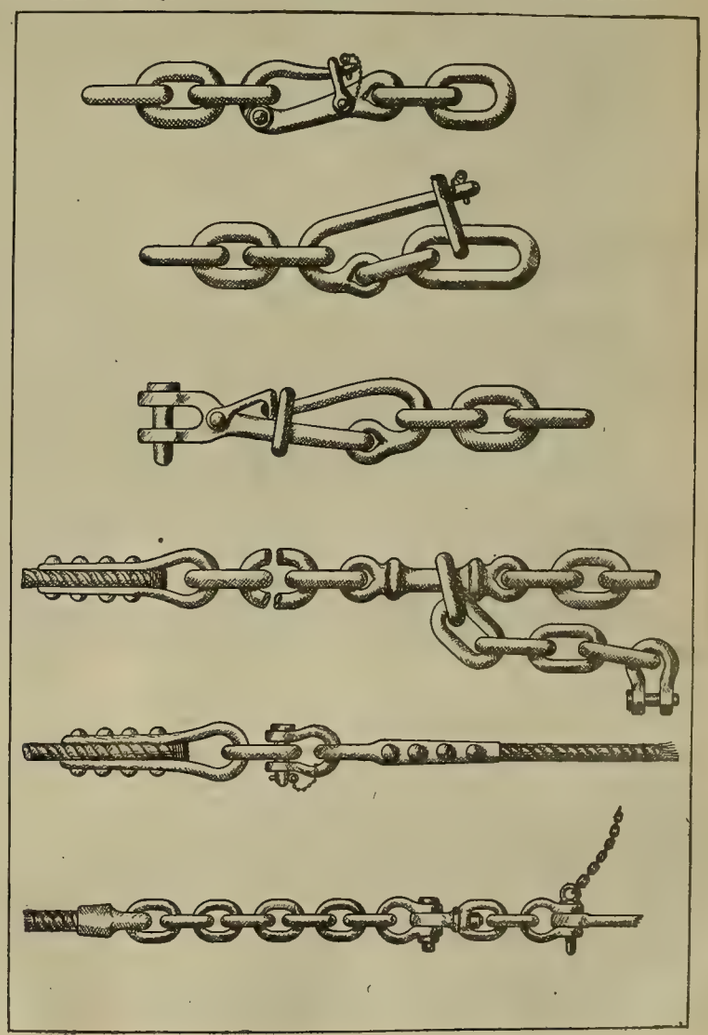
The amalgamating pans are arranged to run quicksilver in and out at will, and chemicals may be applied to benefit the quicksilver at or near the last of the line of pans.

In amalgamation by this method, the pulp comes to the pans in even and regular proportions of sand and slimes. It all necessarily passes through the series of pans and settlers, and receives a uniform treatment. This uniformity and regularity cannot be attained when the pulp is settled in tanks and worked by charges. The amount of treatment the pulp receives in its passage is proportionate to the size of stream that flows into the pans, and the amount of treatment may be increased by decreasing the inflow, or vice versa.

With the advantage of a thoroughly systematic treatment, the greatly lessened labor and the comparative cleanliness, popularity naturally befalls the continuous system of pan amalgamation. These mills are built and erected on the ground ready for work, by the Fulton Iron Works of this city. One is now in process of erection at the Golden Gate mine, Tuolumne county.



BOSS CONTINUOUS PROCESS MILL.



This process has marked a distinct advance in the milling and amalgamation of silver ores on this coast and in Mexico. A great saving is effected in power, wear and tear as well as the labor required for its operation over the old system of settling-tanks and pan charges. By an examination of the cuts shown herewith it will be seen that a large reduction is effected in first cost in the erection of the mill. The tanks and tank-room are entirely done away with, slum and china pumps are no longer needed, and the shoveling of the settled pulp from the tanks into the pans entirely avoided. The buildings cover less area, and as the pans and settlers are all on the same level, high pan frames with the grading and retaining walls they render necessary are also saved.

Upon the ore coming to the mill it is dumped over the grizzlies and passes through rock-breaker and ore-feeders into the batteries in the

Ophir.

Renewed Activity in an Old Mining Camp.

EDITORS PRESS:—For some time past the mining industry in this portion of Placer county has been decidedly on the wane, and the indications were that but few more pages would be added to the mining history of this once thrifty and profitable mineral belt. This state of affairs was the result of a combination of causes of no great moment, but of sufficient importance to produce for the time being a general stagnation. That the mines yielded almost fabulously in the palmy days of the past is an assured fact, and that extensive and paying ore bodies still exist is equally as certain. Many promising quartz fields are to-day practically abandoned or only sufficiently worked to protect the titles to property, either through bad management that has resulted in the cessation of operations in leading mining propositions and the closing down of other properties that were only developed to a very limited extent. The latter theory is applicable here and is unquestionably the primary, and, in fact, the sole cause for the decline that has been experienced. The opinion has prevailed among mining men that this district was one of the "pocket" order, and it must be admitted that the shallow workings and the discoveries made have gono far to corroborate this opinion. This idea has kept capitalists from becoming identified with our promising camp, and deep development is consequently unknown. Without but a single exception it is a question if there is a property out of the large number operated in the past that has been explored to a greater depth than 250 feet, while the majority of them that paid well have never been developed below the 100 level. Within the last two years, however, a radical change has taken place and our struggling delvers can now discern the glow that foretells of brighter days. Syndicates and combinations have been formed that are now operating some of our most promising properties, and so far as development has progressed results of the most encouraging nature have been their reward.

The Hathaway Mine,

Operated by Valentine Bros. of San Francisco, is a striking illustration of what depth will do toward enhancing the probabilities of our surface—prospected mines—and the pronounced improvement that is everywhere apparent in the deeper workings of that property will be a safe criterion for the guidance of those who premeditate operating here. For years this property existed only in name, no work of any consequence being performed in it, but to-day it is one of the best paying mines in this portion of the Golden State, and is steadily improving in value as work progresses. True, the character of the ore has become more rebellious as depth has been attained, but this is a natural characteristic of gravite formation and a change that mining men of experience expect. Fortunately this change is no detriment to the owners, but to the contrary is a welcome one. Though refractory, it is exceedingly rich, and, under the system of concentration employed, it is easily saved and transported to chlorination works for reduction. In connection with the sulphurets, the vein also carries a paying quantity of free gold.

The Eclipse,

Another mine of great promise that was recently purchased by a combination of Eastern capitalists is now being developed under the supervision of J. B. Patterson, through whose efforts the property was sold. In early days this mine was extensively worked, near the surface, by Spaniards, and the rock milled through arastras, and those who are conversant with the past history of the property assert that it yielded gold in large quantities, but the volume of water encountered and the inability to handle it by the primitive methods employed, no efforts were ever made to follow the ore body below the water level. Time and time again parties undertook the responsibility of giving the property a general exploration, but as often abandoned the undertaking, fearing to delve deeper on account of water. The development that has taken place under Mr. Patterson's supervision has demonstrated the fact that the volume of water generally regarded as an insurmountable obstacle, has its home near the surface and that the greater part of it can be caught in tanks, thereby doing away with all the inconvenience it has caused, and the mine can be probed at a great depth with but little trouble from this source. The location, if your correspondent has been correctly informed, comprises 24 acres in the very heart of this rich mineral zone, and is traversed by three ledges that crop on the surface, all of which have yield. ed well. The veins are remarkably strong and well defined, existing between perfect walls, and though the formation is granite there is a lap of porphyry on the foot-wall that follows, with striking regularity, the three veins. So far as can be ascertained, but little drifting has been done on either of the veins—all the wealth extracted having been taken from the numerous shafts or inclines that were sunk or within a very short distance on either side of such openings. Though it is well known that this entire belt is a perfect network of quartz veins, it is remarkable that no underground crosscutting has been performed, but to the contrary, all explorations have been confined to the veins upon which openings were made. As an illustration of the benefits to be derived from such

Work Under the Ground,

It is only necessary to call attention again to the fact that three strong veins, all having a surface existence, pass through the Eclipse location. Is it not a reasonable hypothesis that an equal or even greater number of what are termed "blind ledges" have a home within the confines of the boundary lines. These so-called "blind ledges" are just as liable to hold a chute of ore as those that throw "float;" in fact miners have a superstitious idea that hidden veins are the best. Supt. Patterson is thoroughly familiar with all the peculiarities of this mineral belt and particularly acquainted with the Eclipse ground, and it is his intention to drive the improvements already projected, into virgin ground, and then crosscut the territory on either side of both veins upon which inclines are being run.

Arrangements are now being made for the erection of hoisting works, and when this essential is in operation a searching exploration of the ground will be commenced. The opening of this property is watched with deep interest by mining men identified with this district, as the future of the camp will depend largely upon the success or failure of this proposition. Old-timers, however, all concur in the opinion that success will certainly crown the effort and that a valuable and heavy producing mine will be the result. Water-power will be employed to run the machinery, and economy, in operating the property, will be most rigidly observed. The property is admirably situated for cheap working, being within a short distance of the railroad, and the cost of transporting necessary mining supplies, etc., comparatively light. By way of diversion it might be interesting to those who are identified with the property to know that

There Is a Gulch

Between the two veins upon which they are now sinking, and during the placer days of long ago this gulch was worked from its source to its mouth, and if reports be true, and they seem to be well authenticated, was fabulously rich, pieces of the "yellow metal weighing as much as $2000 having been taken from the shallow surface washing. This gulch was unmistakably fed by the float from the two ledges alluded to or the wearing down of an ore chute in one or both of them. Taking everything into consideration, those who are investing in this proposition have the assurance that their venture is one of great promise, and if the opinions of experienced miners have an existence in fact, the time will come when "Eureka" will be their cry.

It is reported that the Gold Blossom, an old and well-known mine, will be started up this fall or as soon as water can be obtained to run the machinery. The Bellevue is now being worked and it is rumored that a force of men will be put to work in the Three Stars and the Belmont.

That the mining horizon is much brighter than it has been for years is positively certain and it is not improbable that our old mining camp will again experience a semblance of its old-time glory. R. C. G.

The Arlington Mine, Washington.

EDITORS PRESS:—In your issuse of Aug. 3d, I see you have copied from the Ellensburg paper that the Arlington Company are making arrangements for the shipment of 400 tons of machinery over the Ellensburg & Conconally line of boats. Like all other things, there is some truth about it, but as yet the machinery has not been purchased, although they are just in the act of getting machinery. The company have a brickyard cleared, about two miles from the mine, and the making of brick has commenced under the supervision of Joe Klineman of Red Bluff, Cal. It will require about 400,000 for immediate use, as these will be rather extensive works. Part of the Russell process is adopted, but the bulk of the machinery will be bought at San Francisco and shipped to Portland by steamer; then by Northern Pacific to Davenport; then about 120 miles inland by teams to the mine. Everything indicates a general movement by the Arlington Mining Co. for the erection of a mill. Brick, lime and lumber are being made ready for the occasion. The mine is well opened by tunnel and everything is in readiness for the extraction of ore to supply a milling capacity of 50 tons daily.

Other claims in this vicinity are doing well. Among the richest are the Fourth of July, First Thought, Ruby, Idaho, War Eagle and the Modoc, all considered valuable claims, with ledges varying from four feet to 20 in width, with a grade of ore from $20 to $400 per ton. If the working of the Arlington mill is a success, of which there is not the least doubt, we can soon expect the erection of other mills; but like all new camps, one enterprising company has to take the lead in these things. If successful, then others readily follow. The little town of Loup Loup is filled with people, woodchoppers, brick-makers and lumbermen. The boarding-houses or hotels are crowded, giving the new town a lively appearance. Times will be better this fall than at any time since the camp was first discovered. MINER.

Ruby, Okanogan Co., W. T.

Mines in Sonora.

The Chipionenya Mines and Reduction Works.

EDITORS PRESS:—This important property is situated in the foothills of the Sierra Madre, in the district of Ures, State of Sonora, Mexico, and is 70 miles due east from Hermosillo, which is connected by railroad with Guaymas on the south, and with Benson, on the S. P. R. R., on the north. A good and easy wagon-road reaches from the Sonora railroad, the Chipionenya, over which road no more than $12 is charged per ton for freight. (All dollars mean Mexican coin.)

The mine property consists of the Chipionenya of 200 meters length by 200 meters width, and of its extensions, Buenos Ayres of 200 meters length by 300 meters width, and La Emma of 800 meters length by 300 meters width, and of the El Jicote of 800 meters length by 200 meters width, which ledge runs parallel with and 1000 meters west of the Chipionenya. Of these a part of the Chipionenya and part of the extensions are developed by a shaft 100 feet deep, double compartment, and operated by a horse-whim, and about 170 feet northwest of it by an incline of 30 degrees pitch and 145 feet long, both connected on the level by drifts, which extend about 300 feet, all in good ore. Of different pillars in those parts of the mine which were cleaned out since the resumption of operations, samples were taken which averaged 148 ounces silver per ton.

The ledge is from one to five feet thick, and averages on the lower levels four feet, dips east 45 degrees, and runs in a north by west direction. Country rock is granite; both walls of ledge are well defined. There is some water in the mine, easily handled with buckets, as even in the wet season there is no more than 600 gallons in 24 hours.

From the outcroppings which can be followed for over half a mile, the first owner, a Spaniard by name of Chipiona, sank three inclines in in 1824, following the ledge, and took out considerable silver, enough to make him rich, and the builder of churches in Sonora and in Spain. The work was done in the then usual slipshod manner, taking out the richest ore, and throwing the balance, mixed with debris, on the dump, which contains now about 20,000 tons low-grade ore, which could be benefited by assorting it by hand, as is the fashion in many paying Mexican mines, where the absence of sufficient water or capital necessitates such crude and primitive proceedings.

After Chipiona's death the mine passed into the hands of different Mexican owners, who went on "scratching and badgering," as was then and there customary, with more or less, generally less, success, till an American company got hold of it, which then proceeded to sink the above mentioned incline to run the different drifts, at the same time constructing mill, leaching tanks, roasting furnaces, reservoir, till the superintendent, an Englishman, was killed in a quarrel with his foreman, who fled, and thus the whole concern was left to the acquisitive tendencies of the population, which made such good use of such a rare, and to them desirable opportunity, that nothing of value which could be moved, not one loose nail, was left on the spot. This occurrence in conjunction with Apache raids and the Franco-Mexican war brought ruin and devastation.

In course of time the property passed into the hands of some enterprising people, who began the cleaning of the mine and the reconstruction of the works, which consist of a ten-stamp mill with rockbreaker, run by steam, six large brick roasting furnaces, ten leaching and precipitation tanks and settlers, a cemented reservoir holding 440,000 gallons. Connected with the works are blacksmith and carpenter shops, buildings for stores, offices and dwelling houses.

The mill, furnaces and tanks are able to work 25 tons of ore in 24 hours. Salt can be delivered at the mine at $22 per ton. Mining timbers close at hand, and fire wood at $3 per cord. Wages are $1.25 for miners and 75 cents for workmen.

Water is brought to the reservoir through a two-inch pipe from a spring half a mile above, and if the supply should not be thought sufficient, another spring, four miles distant, could be utilized, at which point it would be necessary to pump the water to the top of a hill 500 feet high, from whence it could be brought by pipe to the works. The power could be generated at the works and applied at the pumping station through a dynamo.

Now as to the important point of the character and richness of the ores. The ledge carries a seam of argentiferous galena, occasionally 20 inches wide, which is said to average 250 ounces silver per ton, and which is smelted in one of those home-made Mexican smelters; this one is operated by a fan-wheel.

The leaching ores are mixed—chlorides and bromides of silver, too rich to mention, silver fahlore of different combinations and values, some silver-copper glance and silver glance; the ledge matter is quartz and metamorphic rock. Some 54 tons, coming from the lower levels, were sent to Denver and San Francisco and averaged 150 ounces of silver per ton with traces of gold.

Over 200 tons of second-grade ore of about 50 to 60 ounces silver per ton are on the dump awaiting some enterprising parties with sufficient means to bring water to the mine and to begin operations. The mine, as far as opened, is in good order, yet there remains several drifts and connections to be cleaned from debris, which work the present owners cannot undertake, as they have other business to attend to.

The climate is excellent, and good pasture—an important factor in Sonora—adjoins the property. THEO. G. ED. WOLLEB.

Working Cement Mines.

EDITORS PRESS:—There is gold in California for everybody. In the early days of California gold was plentiful and it was an easy matter to make a good living with a common pan, so that very often a large fortune was realized with comparatively little work. But this class of mining was soon exhausted. As the miner receded from the river-beds it was found that capital was required to bring water from long distances, therefore the pan, the rocker, and even the sluice-boxes, one by one were abandoned because the gravel and water were getting further apart one from the other. The good days of single-handed mining were at an end; then came a new invention—the little giant hydraulic mining process—but this system was possible only with large capital, and, although it was very successful, yet the debris filling the rivers was causing such damage that laws were created which virtually put an end to hydraulicing in California.

All this has paralyzed the gravel mining industry and has thrown out of employment many thousands of good men; but gold is not exhausted for all that. Large deposits of auriferous gravel exist in the so-called ancient riverbeds. This class of mines is generally remote from water, and as they are in a very hard conglomerate of sand and gravel, apparently cemented together, all the old systems have failed to make those gravel-beds yield their golden treasure. The stamp-mill was the only process that promised to be successful, but it was found too slow and expensive and had to be abandoned.

What is wanted now to revive this great industry and give employment to the multitude, and give a chance for capital to double and treble itself, is a process that will reduce the gravel cement to a pulp and that will be a simple and economical amalgamating process which will require a very little amount of water.

I have spent a good part of 17 years in solving this problem, and claim that I am able by my process to thoroughly wash 100 tons of such gravel with three miners' inches of water every ten hours. My amalgamator is founded on new principles to disintegrate cemented gravel without the aid of machinery, in fact there is not a cog-wheel employed in all the whole process. In a claim with stuff that averages only $1 per ton, by this process it is treated for 30 cents per ton, leaving a profit of 70 cents.

I am perfectly willing to impart my experience in this matter to any one interested in working the class of mines referred to. I have made many tests and am satisfied I can accomplish a great deal of work at unusually low cost. C. S. DUHEM.

5 Stockton St., San Francisco.

Surveys in Northern Counties.

A correspondent of the *Northern Advocate* says:

In looking over the MINING AND SCIENTIFIC PRESS I notice an article written by J. H. Crossman, entitled "Northern Counties of California," of which he speaks in highest terms, and thinks there should be an accurate survey and map with text-book. The map should show in detail the water-sheds, rivers, mineralogical features, and mineral belts, as well as the dead-river system of Pliocene channels—together with the timber belts, soils, and general agricultural features.

Having made this country my home for many years, and having engaged in mining and agricultural pursuits, with the ever-growing conviction that we had an inexhaustible source of wealth, not only in the productiveness of our soil, but also in the countless millions that must flow into the treasury of the world from our mines—I see that we sit idly; and I wonder why it is that capital—lying idle and seeking investment—should hesitate to invest in an enterprise that promises such great results as the opening of the dormant resources of the northern counties of California. I think the writer in the PRESS strikes the keynote. I am convinced that the great wealth of this vast district is but little known to the outside world. We are occasionally visited by an adventurer, claiming to be in the employ of capitalists, but when the facts are reached we find him a self-appointed agent, and many times not able to pay his traveling expenses. He is looking for a rich find; but, unfortunately for him, he comes to the wrong place, fortunes not being made here with the rocker or long-tom, as in other localities "in the days of '49."

But in almost every instance those "expert" adventurers are favorably impressed with the country, and return to give glowing descriptions of the vast wealth that lies hidden in what to them is the new El Dorado. But the chary capitalist can't be induced to even investigate a country that has been settled and prospected for 40 years.

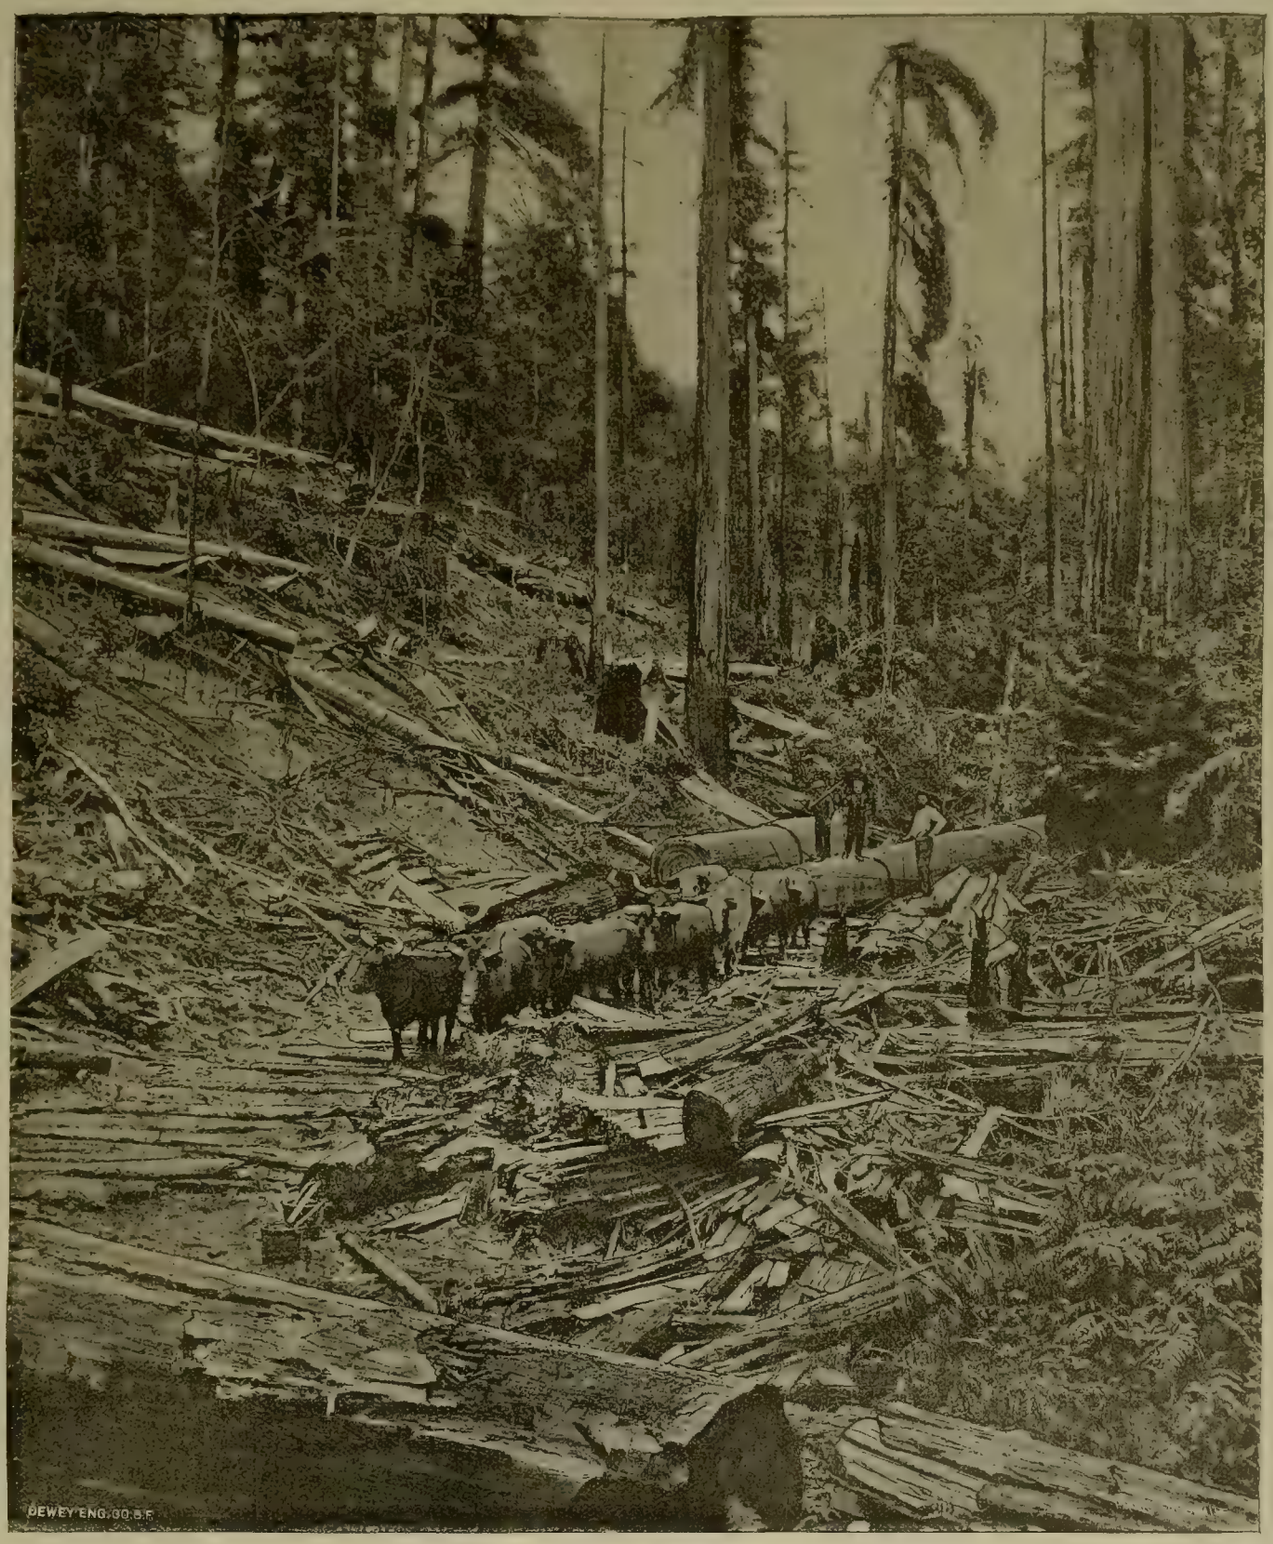
The self-appointed agent, by playing on the credulity of the old-settlers, may have succeeded

in bonding a mine (that is, if he could do so without paying anything down), thinking it might help him to get capital interested in what he believes can be made to yield a bounteous return. But capital, like everything else, is hard to turn out of the worn grooves, and the expert, be he never so honest or dishonest, is doomed to disappointment, and is soon heard of no more. They all report favorably of what they see, and all agree that the country will bear investigation. The great trouble is to get men to investigate. With improved machinery and facilities for working ores of low grade, they are being sought after and profitably worked in other localities.

Investigation is what we want—and an accurate survey, and description of the resources of our country, would help us more than anything, unless it would be a railroad.

To Mend Broken Bone.—A gentleman had a small rule made of bone, which he accidentally broke. It was mended by a cement made as follows: Take of isinglass 1 ounce, distilled water 6 ounces, boil to 3 ounces, and add rectified spirit 1½ ounces, boil for a minute or two, strain, and add while hot, first a milky emulsion of gum ammoniac one-half ounce, and then tincture of mastic 5 drachms.

Wm. Wilkinson, formerly of Custer City, who is at present at the gold mines of South Africa, furnishes a less flattering account of the mines of that remote region than is given by the average newspaper. He states that the country is nearly all located, and that water is very scarce. He thinks, however, that if he had been there a year earlier he could have made considerable money. The gold found thus far is mainly in lodes, which are payable but not to the extent reported. Natives are extensively employed in the mines, and receive from 25 to 50 cents per day. White miners are only employed as foremen over the native employes. He states that O. D. Holliday, formerly of Custer City, and one of the original locators of the Old Bill mine, is there in the employ of a mining company as superintendent at a salary of $500 per month.



Pasteur's Treatment in Italy.—Throughout Italy the principal towns are, one after another, providing buildings for the treatment of hydrophobia according to Pasteur's system, and the municipal council of Rome has lately decided to devote the necessary sum of money to furnishing a Pasteur institute there. This is a strong proof of the increasing confidence felt in the treatment.

Logging Scene.

We give on our first page a realistic scene among the California redwoods. This particular view was taken near the Gualala river, Mendocino county. After the trees have been felled and cut into the proper length, the logs are hauled by oxen to the "landings" on the side of the railroad tracks, where they are placed on cars and transported to the mill. In some localities where there are no railroads the skid roads run direct to the mill; but this is impracticable for long distances. At most of the places on the northern coast the mills are at the mouth of the rivers and the logging is carried on some miles back from the coast. The skid roads are then used to haul the logs to the trains. These roads are made of small logs or limbs placed a foot or two apart. Along the center of the top a rounding groove is soon worn, in which the log lies. This grooved part of the skids is generally greased with some cheap lubricant so that the log will slide easily.

Of course these roads are downhill, the trees being cut on the ridges and sides of the cañons and dragged over the skids to the railroad at a low point. All the way from three to a dozen logs are hauled in a string, being connected by chains. These skid roads may be seen in all directions in the timber back of the mills. On the steep hillsides they are not used, as the logs are more easily hauled than on the surface of the ground. In some places it is not necessary to use lubricants, and in others water is poured on the skids by men who go ahead with buckets and a dipper.

To the lover of nature, the scene depicted in our engraving has a pathetic coloring. The rotting debris which forms so large a part of it, is all that remains of a once magnificent forest, a primeval temple of the Almighty Himself, upon whose towering pillars and vernal arches seemed to rest the very canopy of heaven. Year by year the ax of the woodman is eating its way into these glorious woods, the like of which is not in all the world, and the like of which will never be again so long as it shall endure.

A LOGGING SCENE IN THE NORTHERN CALIFORNIA REDWOODS.

Coal is worth $1.87 per ton at Leavenworth, Kansas.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE, LIMITED.—*Ledger*, Sept. 7: But little change at this mine for the last week. The rich ore in the north drift continues. They ran through a vein of fine-looking ore in the west crosscut from shaft No. 3, supposed to be the first west vein from shaft No. 1, and two days ago they struck quite a flow of water in the same crosscut at the 550-foot level, believed to be the hanging-wall of the west vein. Miners always like to see water when approaching a vein of quartz as a good sign. They are preparing to sink the main shaft for another level—about 85 men employed at the mine all told. The large reservoir at the mill is about completed, then about 200 men will be discharged, reducing the force to about 65.

SUTTER CREEK. — Cor. *Ledger:* Sinking the sump at the North Star is finished, which makes the total depth about 820 feet. Drifting east is now in progress, and they intend to drift not less than 150 before they will be satisfied in that direction. There will also be drifting west and south before the property will be abandoned. Strong hopes, however, are entertained of striking something good in the east drift. Everything about the Wildman is running smoothly. The riffle belts recently put on the concentrators by ex-Governor Blaisdell are running satisfactorily, and bid fair to prove a valuable invention.

Calaveras.

WILL START UP.—*Prospect*, Sept. 7: The 60-stamp mill at the Utica mine in Angels will resume operations about the first of next week. Everything is being put in readiness for work in and about the mine as soon as water can be had this fall.

RICH ROCK. — Calaveras *Chronicle*, Sept. 7: Some exceedingly rich rock was struck in the Ariel mine located on the Calaveras side of the Mokelumne river below the Boston mine, about a mile and a half from this place. The mine is the property of John Brackett and Wm. Hutchinson of this place. It is only about eight or nine months since the mine was discovered and work commenced upon it. For some time after hitting upon it the owners prospected to a considerable distance along the vein in an open cut, crushing the crumbled rock in a mortar and panning it out. It paid very rich at times. One day as high as $400 was taken out by this simple method. A tunnel is being run into the hill, which is now in a distance of 40 feet, showing a vein of rock one foot in width at a depth of 60 feet from the surface, from which the handsome specimens to which we refer were taken. The prospects are that Messrs. Brackett and Hutchinson have found a valuable mine. The Eureka mine at Blue mountain now owned by Fred Greve, Esq., is also showing some splendid rock. The prospecting shaft is now down to a depth of about 100 feet, showing a vein three feet in width and ore averaging $75 per ton.

El Dorado.

SOLD.—Placerville *Observer*, Sept. 10: According to previous notice the McNulty quartz mine was sold at Trustees' sale on the 3d inst. for $30,215.18, J. B. Drury of St. Louis being the purchaser. Mr. Drury tells that operations will be commenced in earnest as soon as water can be procured for hoisting and other purposes. We are glad to note that this work will be conducted under the management of Mr. R. S. Raw, which is a guarantee that a thorough system and strict economy will be the rule. James Vandegrift was up last week from the Los Padre mine near Nashville. The shaft is down over 50 feet in good ore, the ledge being over 3 feet wide. Mr. Vandegrift intends making arrangements to put up hoisting works. This mine is on the same range as the McNulty, Church, Equator and other important mines. The finest gold ore shown in this town for a long time was brought down from the Bobby Burns mine during the past week. At water level the ledge is nearly five feet wide, showing free gold, galena and iron sulphides. This mine has reached a depth about as deep as it can be hoisted by hand. At water level the ore seems to increase in richness, showing not only more free gold but a decided increase of sulphides.

Inyo.

SOUTH-EASTERN INYO MINES.—Cor. Inyo *Index*. Sept 4: At Wild Rose district the canyon widens out, forming a little valley of several acres of black loam. A small four-stamp prospector's mill, with barrel for treating ore under the Aaron process, is now successfully treating ore from the district, giving excellent returns for its limited capacity. Easterly from the mill the canyon opens out into a large valley covered with grasses, forming a fine winter and summer stock range. A good wagon-road with a light grade runs from the mill, through the valley, to the timber. At a distance of seven miles, the Modoc M. Co. some years ago built 10 charcoal kilns at this point. A few years ago, when Lookout mining district was running her smelters, this was the source from which timbers, charcoal and fuel were obtained. At a distance of three miles from the mill lies the Virgin mine. Considerable work has been done toward developing the property sufficient to expose a body of ore about 14 feet wide, which averages 41 ounces in silver, as sampled by a party now having it bonded. Six miles north the North Star mine is situated in mountains east of the valley. Three miles farther north, higher up the mountain-sides, and the Garibaldi mine is seen. Still northerly, some three miles, and the Nellie Grant mine, with its big body of free ores, is found. Here is plenty of water, one spring furnishing sufficient for a large mill. A natural pass, having but slight grade, leads from this point, which is called Emigrant Springs, to Furnace creek in Death valley. From Death valley, a short distance north of Coleman's borax works, to Panamint valley, heavy loaded teams have passed down to the valley without trouble and with no road to follow. West, down into Panamint valley, the grade is gradual. A railroad passing through this route would open up a fine mineral country to the north and south, receiving an immense amount of low-grade copper and lead ores which are now practically valueless. It would make the enormous borax works of Death valley, now idle, profitable to work. It would build up a country richer in mineral wealth than any other part of the United States. Enormous lead, copper and antimony ledges that cannot now be successfully handled will then be worked, furnishing the railroad freight in considerable quantities. For instance, there are several antimony ledges in this vicinity which have had work enough done upon them to expose great veins of high-grade ore, in some cases over 12 feet wide, with hundreds of tons of ore upon the surface, which, from careful average samples, is worth, delivered at railroad depot in San Francisco, $40 per ton. Under present conditions it costs at the least $38 per ton to deliver the same there, bringing the shipper $18 per ton in debt for transportation, excluding other incidental expenses.

FIRE CLAY. — A large body of fine pipe-clay has been exposed by the elements close to the pass which appears, from casual inspection, equal to the German article used by glass works for their pots.

MONSTER LEAD BLOW-OUT.—From Emigrant Springs, following an Indian trail 14 miles over and near the summit, up hill and down hill in a northerly direction, we find ourselves at the head of Big Cottonwood canyon. South over the trail to a small spring, then up the mountain-sides westerly to a big lead blow-out, where are hundreds of tons of galena carrying from 50 to 80 per cent lead, and about 12 ounces in silver per ton. The ore is scattered about in all directions, from minute particles to boulders weighing a ton or more.

ABANDONED PROSPECT.—Back again to the summit, following the trail a few miles on the western slope of the range, a short distance west of the trail, the ruins of an old log cabin stand near to where considerable work has been done in former years by some prospectors. A large pile of lead ore lies upon the dump. Cuts have been run and shafts sunk, exposing a fine ledge. The circumstances under which this work was performed must have been very discouraging, as the nearest water is six or eight miles away, and it is about 40 miles to where provisions could be obtained. The formation is lime, massive and of character favorable for large bodies of ore.

EXTENSIVE MINERAL TERRITORY.—The section passed through has every characteristic of a true mineral territory. Great porphyry dikes trend through the mountains. Greenstone protrudes. Sulphur banks exist. Basins with their aqueous formations, which were formerly hot springs, can be distinctly traced. Veins with well-defined walls, having clay-porphyry and plastic clay gouges and ledge matter, can be traced for miles. Many veins have been exposed several hundred feet in depth, where the ground was favorable for such work, by means of crosscutting through tunnels. Having been in British Columbia, Idaho, Montana, Wyoming, Colorado, Utah and Nevada, and seen many mining districts in those sections, all considered to have very valuable mining territories, they are all dwarfed in comparison to the extent and magnitude of this section. These are no imaginary conclusions, but the result of some two months' observation, and the conclusions are arrived at from more than 20 years in mining sections.

Mariposa.

GOLD-BEARING QUARTZ.—Mariposa *News*, Sept. 7: For an area of 30 miles in length by 10 or 12 in width, in what may be called the mineral range of the foothills south of the Merced, the whole territory abounds with gold-bearing quartz. Most of it is a low-grade proposition; now and then some rich rock is found, but for a variety of causes, principally the want of a cheap motive-power, our mining industry is at a standstill. Wood is high, water scarce and capital nowhere. The Mariposa Grant has been, and always will be, the cause of the whole county being idle, until it is fully developed. One of the best-paying properties now, and one that will very shortly attract the attention of mining men, is the Francis mine. This mine was opened away back in the '50's. A few blows of the pick unearthed a treasure, and satisfied with it, the owners left it to be claimed, jumped and abandoned. Lately, a certain amount of capital was invested therein, machinery was bought, roads built, a great deal of bungling work done that finally proved a failure, and brought it into its present owner's hands. The probabilities are that next winter it will astonish a few hitherto unbelievers. The main tunnel is 140 feet, running east and west. In the upper drift, communicating with the tunnel by means of a stope, are four feet of good pay rock, richly streaked with sulphurets. For a distance of 30 feet the vein runs clearly defined between solid walls, country rock on hanging, porphyry on foot-wall, when it swells into a hog-back pinching the vein to two feet of rich rock and a pay streak clear up to the hanging, then sloping again at an angle of 60 degrees it pitches into the bowels of the mountain between hard, solid walls with scarcely any water to interfere with the working. At the present time works are on a rich chute pitching undoubtedly toward the mother lode, one-half foot solid pay streak on the foot-wall full of iron pyrites, galena and light sulphurets, two feet of white porphyry, then three feet of rich decomposed matter stuck on the hanging-walls. The mine has a fine 10-stamp mill, prepared for running by either steam or water-power, with facilities for 10 more under a 48-feet pressure. A No. 2 Dodge breaker, right near the tunnel, does away with all extra handling of rock. At present water is scarce.

Napa.

QUICKSILVER SHIPMENTS.—*Calistogian*, Sept. 4: During the month of August flasks of quicksilver produced at the mines were shipped from Calistoga to San Francisco as follows: Bradford mine, 164; Napa Con. mine, 400; Gt. Western mine, 17; Sulphur Bank, 225; total for the month (flasks), 806.

Nevada.

THE ROACH & MANION. — *Tidings*, Sept. 6: Nothing has been done on this claim, situated on or near Carey Manion's place, since the water-power hoisting and pumping plant was put in, two months since, water-power having failed. This winter, however, development work will be actively prosecuted. To near water level, where a barren streak was encountered, the ledge averaged from four to eight inches in width and yielded over $20 a ton. At water level, and just before operations were suspended, the original ledge was again encountered.

STRIKE IN THE HERMOSA.—*Tidings*, Sept. 4: From the 90-foot station of the Hermosa mine to the depth of 125 feet, there was no ledge in the shaft. Monday the contractors at the depth last stated, cut a solid vein of quartz one foot in width, and the indications are such as to warrant reasonable elation on the part of the owners. Free gold and other minerals are shown by the quartz, and pans of fine dirt taken from above the ledge and washed, return an average of 10 cents to the pan. Developments will be watched with interest.

IMPROVEMENTS AT THE IDAHO.—Grass Valley *Union*, Sept. 7: The Idaho Mining Co. is now preparing to make some important improvements about the mill. The large buddle heretofore used for separating sulphurets from the pulp is to be discarded and Frue and Triumph concentrators put in. An additional battery of five stamps is also to be put in, making in all 40 stamps for crushing the ore. It will take 16 concentrators for this number of stamps, 10 of which will be the Frue and six the Triumph. To provide for these the mill floor will be lowered, the necessary excavation for which is now being made, but the floor will not be removed until everything is in readiness, so as not to interrupt the regular operations of the mill. Besides the concentrators other improvements will be made in the aprons and sluices connected with the batteries. The work is now being done, and will involve an expenditure of some thousands of dollars. The work of remodeling the mill will be completed in about six weeks.

Plumas.

THE JOHNNY BULL.—Greenville *Bulletin*, Sept. 4: The five-stamp mill on this property started up on July 25th and a cleanup was made last Saturday. It is reported that the product was between $1600 and $1800. The mill crushes on an average 7½ tons daily. This showing is very satisfactory and proves the mine to be a valuable property. The owners are driving the tunnel ahead and stoping out ore. The prospects are equally as good as those of the past month. The ledge continues strong and well defined. The whole property is operated with little expense comparatively, and as the ledge goes directly into the steep mountain and the tunnel begins at the bed of the canyon, it seems a certainty that a large sum of money will be taken out by the owners, Messrs. Firmstone, Old and Richards.

THE ALTONA.—Judge Emmons, the owner, has been crushing the ore at the Arcadian mill, which has now run a little over a week. The Judge reports good progress and appears to be well satisfied with results thus far obtained. Many reports come to us from the North Fork to the effect that James Firmstone and Samuel Ballou are obtaining good pay from their river claim below the Glazier mine. They put in a wingdam and are working a bar. One man in three days took out eight ounces of gold; but of course no such average as this is maintained. The present river cut the channel of which the Glazier mine is a part, and the mine now worked by Firmstone & Ballou is supposed to have resulted from a break in the old channel near by and above. Work at the Indian Valley is now progressing as usual. The water in the shaft will soon be pumped out. The Union tunnel is driving ahead with the usual speed. News comes from Butt Valley that a large nugget was found in the Dutch Hill mine last week that weighs $714. A Burleigh drill has been placed in the Crescent and is operated by steam. It is said to work well now. The mill continues to run as usual.

San Diego.

PINE VALLEY.—*San Diegan*, Sept. 7: C. W. Withrow, a veteran miner, is in from Pine valley. In answer to questions asked by the reporter, Mr. Withrow gave a brief description of the valley and explained what the miners are doing. Pine valley is 50 miles from San Diego, ten miles east of Descanso, and only seven miles southeast of the big Cuyamaca reservoir which is the source of supply for the San Diego Flume Co. Pine valley is, in fact, located not far from the desert and close to Laguna mountains.

JULIAN AND BANNER.—Cor. Los Angeles *Miner*, Sept. 4: The mines near Julian and Banner are all included in one district. A high hill separates the sites of the two towns. On the Julian side, the principal mines are the Owen and Gold Ring groups of mines, and the Stonewall. The Owen mine, formerly owned by James & King, but recently sold to Mr. Williams of Ohio, is one of the old reliable Julian mines, having yielded to its owners $300,000. From the Owen, a short drive brought me to the Gold Ring, a group of mines owned by Messrs. Hamilton, Feeler & Melrose. These promise to be a second Stonewall in producing gold. The owners are pushing work, and are being richly rewarded for their labors, as the ore now being taken out mills over $200 per ton. As to the famous Stonewall, and I had heard that the mine had closed down for want of ore, imagine my surprise at finding a 10-stamp mill running day and night and a substantial foundation being built for a 40-stamp mill There were 130 men working in the mine, to say nothing of the men who are working in the shingle-mill, brick kiln, etc. There are also the San Diego mine and the Helvetia mines, which, with the Owen mines, are on the far side of the barren hill back of Julian, and have both been worked somewhat. They are both considered very fair mines. The San Diego was owned by James & King, and was included in Mr. Williams' purchase. In the Banner district I visited the Ready Relief, Hubbard, Redman, Hidden Treasure and Antelope, all these properties being owned by the Bailey Bros., and I found work progressing in good shape. The first thing that attracted my attention was the absence of timber in the shafts and tunnels, slate and rock being used instead, which is a great saving in expense, as well as in labor. They are conveniently located for both wood and water, and the method of developing them is excellent. The next mine visited was the Atlantic Cable, which is adjacent to the Bailey property. This mine is owned by the Cowles Bros. and G. Redman, but is at present bonded by a Los Angeles party. It shows a three-foot ledge at a depth of 85 feet and carries $30 ore. The writer next visited the Fraction, where all were busy driving a tunnel, work going on day and night. Last but not least in this old mining district, I found myself clinging to a rope and being lowered to the 65-foot level of the Cincinnati Belle. This mine deserves more than a passing mention, being probably one of the richest ever discovered on the Pacific Coast, as the former owner and locator of the mine has taken from it thousands of dollars with hand-mortar, working the mine alone. The mines named are all that are being worked to any extent.

Sierra.

HORSE SHOE.—*Mt. Messenger*, Sept. 7: Dan Reilly was down from the Horse Shoe quartz mine Sunday, and reported the tunnel in 800 feet, with face in very hard rock, crosscutting from the main tunnel. Wm. Rowe and C. D. Beightol were down from their Big Crevice drift mine, Secret Canyon, Sunday, and report diggings paying well. They took out one-half-pound nugget last week. The fires are not in their vicinity.

SIERRA CITY.—*Tribune*, Sept. 7: Sierra City is still the leading mining district, and it will be as lively here as ever again in the spring. What place has got more rich mines and prospects around it than Sierra City? The Young America mine is as good as ever. They employ over 100 miners regularly. The cleanup for August was $20,000. The Cleveland mine, situated a short distance from town, is working steadily. About 15 men are employed there. Good cleanups are made every month; and it is only a matter of time when a large crew of men will be employed at this mine. There are about 30 men employed at the Marguerite mine below town at present. Fred Morris, the superintendent, is pushing things, and it will not be many weeks before the mill will be at work crushing rock. The Mountain mine is destined to be one of the best mines in the State. About 18 men are employed there now. In the spring the company expect to have over 100 miners at work. It is their intention to build a 40-stamp mill the first thing in the spring. Contracts will soon be let to build a tramway and other necessary improvements. The company that has hold of the mine has plenty of money; and, besides, they know how to manage a mine. The Buttes Saddle Co. have about 10 men at work in their mine at present. It is their intention to run a wire tramway from the mine to the Kentucky mill and crush what rock they can this winter. Both the Sierra Buttes and the Mountain Mine Cos. have made offers for this mine, but the owners do not seem very anxious to sell unless they can get their price, which, we understand, is $150,000. Of course, that sum is pretty large for an undeveloped mine. It is believed, though, that the mine will eventually fall into the hands of the company that is best fixed to work it—the Sierra Buttes Co. The party that leased the Colombo mine made a cleanup last Monday of between $900 and $1000, after about 25 days' run with only five stamps.

Siskiyou.

QUARTZ.—Yreka *Journal*, Sept. 4: John Boyle & Co. have finished crushing quartz at Forks of Humbug mill from their ledge at head of North Fork, with good success, the quartz averaging about $75 per ton. The mill is now engaged in crushing quartz from a new ledge on same creek, lower down, worked by Barnes & Co., which is rated as paying an average of $50 a ton. Spencer & Co. on Humbug are also taking out good-looking quartz, and expect to be ready in a short time to crush a large quantity. Several other prospecting parties who have lately opened new ledges and taken up old abandoned ledges, are getting out quartz to keep the custom mill going constantly day and night. The Hegler boys and Aldrich are also working their ledge energetically to keep their steam mill going, although water is very scarce.

HYDRAULIC.—Yreka *Journal*, Sept. 11: Hon. R. H. Campbell has been fixing up his ditches and pipes at Quartz Valley hydraulic mine, in preparation for coming winter season. If he can secure a good supply of water so as to work the giants from January to July, he will take out an immense quantity of gold dust, the past winter having been the lightest ever known in the way of water supply. The Allen Brothers' quartz mine in Quartz valley still continues to pay handsomely, with an abundance of ore in sight of same quality. Col. Williams and Geo. W. Osborne, mining experts from San Francisco, are now examining the quartz ledges on Humbug with a view of speculating in same, if suited. Barnes & Co. had a cleanup of quartz on Humbug last week and have evidently realized big pay, their amount of gold obtained being a profound secret.

Trinity.

LOWER TRINITY TUNNEL.—*Journal*, Sept. 7: Assessor W. C. Given gives us the following items in regard to the Lower Trinity tunnel: There are 16 men employed at the tunnel. The men were sinking below the dam; the top dirt had paid more than wages; the gravel, where the men were working, was paying $20 to $25 to the hand, and the bedrock had not been reached. It is Mr. Power's intention to prospect the river-bed as much as possible this season so as to be prepared to work to the best advantage. To date, the mine has more than paid running expenses, while the prospecting has been carried steadily on. The tunnel easily carries the river, and, at the present time, is not half full. The dam put in by T. J. McWorthy is a splendid piece of work, and is perfectly tight. The tunnel drains one mile and five chains of the river-bed, hence the company has many years of work before it with every prospect of large returns. Judging from the way the surface dirt pays, the bedrock should be very rich. Everything about the claim in the shape of pumps, etc., is in first-class condition and well arranged, and from present prospects the company has a good thing. The company also owns Taylor Flat—a mine which properly worked is bound to be a paying property. The water-right from French creek, which goes with the mine, is one of the finest in the county. The property is undoubtedly valuable, and in the course of another year will make a fine showing. Mr. McWorthy has a claim above the dam; a wheel above the tunnel raises water to run his sluices; a thin wire belt attached to the wheel runs to the opposite side of the river and is joined to a pump, so that the wheel raises water, runs the sluices and works the pump—a very ingenious adaptation of water-power.

NEVADA.

Washoe District.

UTAH.—Virginia *Chronicle*, Sept. 7: On the 600 level, the north drift is advanced 542 feet; formation vein porphyry and quartz. East crosscut No. 1 from the end of the main north drift is advanced 30 feet. Formation, porphyry streaked with quartz showing value.

CON. CALIFORNIA & VIRGINIA.—On the 1650 level. The stopes on the seventh and eleventh floors above this level continue to yield the usual quantity of ore of fair quality. Also continue stoping ore from upraise No. 2, carried up above the north drift from the bottom of the winze 60 feet below the end of the south drift. On the 1950 level from the incline winze sunk 99 feet on the slope below the track floor of this level. Are stoping ore

of fair quality upward and north and south from the winze bottom. During the week 1049 tons and 1990 pounds of ore were shipped to the Morgan mill, 1500 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $27.65.

OCCIDENTAL CON.—During the week extracted and milled 442 tons of ore showing an average assay value of $18.16 per ton. Shipped to Carson Mint bullion valued at $13,059 and have sulphurets on hand valued at $10,000.

CONFIDENCE AND CHALLENGE.—The 500 level joint Imperial north drift is in 892 feet, the face continuing in quartz and porphyry. An east crosscut from this drift is in the same material.

UNION CON.—On the 1405 level west crosscut No. 2 from the north lateral drift is advanced 362 feet, from the south line, continuing in porphyry and clay with some water.

SIERRA NEVADA.—On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 45 feet. Formation porphyry with some water.

CROWN POINT.—The 700 level south drift is showing quartz. The 800 level south drift is in quartz and the west crosscut continues in porphyry and quartz.

OPHIR.—On the 1300 level the east crosscut from the shaft station, to connect with the raise above the 1465 level east drift, is extended 70 feet, face in porphyry.

HALE & NORCROSS.—Crosscutting the mineral belt stripped by the 300 level north drift has begun. The top of the upraise above the 500 level is still in ore.

SAVAGE.—The north drift from the upraise above the 500 level is still in low-grade ore. From No. 2 west drift on this level ore is being extracted.

MEXICAN.—On the 1465 level the north drift from west crosscut No. 1 is advanced 323 feet, continuing in porphyry and quartz.

GOULD & CURRY.—On the 300 level, the north drift from west crosscut No. 2 is extended 84 feet. Formation clay and porphyry.

BEST & BELCHER.—On the 550 level, the northwest drift is extended 98 feet. Formation porphyry and clay.

ALPHA.—The 382 level east crosscut is in low-grade quartz. The shaft is sunk 20 feet below the 500 level.

OVERMAN.—The north drift from the winze bottom is out 50 feet. Raise above west drift is up 229 feet.

IMPERIAL.—The 300 level north drift is out 495 feet from the south line; the face continues in quartz.

YELLOW JACKET.—Continue shipping 50 tons of ore daily. The 500 level west drift is out 590 feet.

NORTH OCCIDENTAL.—On the 400 level have begun stoping ore.

CHOLLAR.—The 850 level north drift continues in hard porphyry.

POTOSI.—The 850 level south drift is in a hard formation.

Como District.

CAUSE OF SHUT-DOWN.—Virginia *Chronicle*, Sept. 4: The owner of the Paymaster mine in Como is authority for the statement that the cause of the shut-down of the mines there resulted from dissatisfaction among Como-Eureka shareholders with the management. About $100,000 has been expended in developing that property, and the *Chronicle's* informant says there is plenty of ore in sight that could be profitably handled. He says he has a body of ore in sight in the Paymaster, but that he has expended $7000 in developing it, which exhausted his capital, and the shut-down of the Como-Eureka has destroyed the faith of moneyed men in that district.

Eureka District.

THE EUREKA CON.—Eureka *Sentinel*, Sept 7: There is a rumor afloat in town of an important strike in the Eureka Con. mine. It is said to be on the 800-foot level of the K K ground. We have no means of verifying the rumor. We have an idea that the strike is likely to be a good one. Al Burt, the foreman of the mine, has always had good faith in that portion of the company's ground. Burt is a first-class miner, and if given his own way about prospecting, and is allowed to push forward this character of work in the mine, which has not been attempted for two years, brighter days for the once famous bullion-producer are quite apt to follow. Good miners believe that there is much virgin ground in parts of the Eureka Con. which should be prospected. Burt, the foreman, holds to the same view. All sensible men know that ore cannot be found without running drifts. Burt has a theory that a drift started at the water level and extended out through certain unexplored portions of the K K would be productive of good results. In years past we have many times seen the Eureka Con. looking as though it was completely exhausted at all points, and a month later worlds of good ore in every part. This coming and going of ore deposits is a characteristic of our limestone formation. The new strike is encouraging, and we shall not be at all surprised if the old mine is as good as new in a brief period.

CHEAP ORE RATES.—Superintendent Gillman, of the E. & P. R. R., has been below for two weeks. He went down to secure a cheap rate for the transportation of Eureka ores to Salt Lake, if possible. We learn that he has succeeded. The new rate is something in the line of the schedule given in the *Sentinel* some weeks ago. It contemplates a sort of sliding scale according to the grade of the ore. Thirty-dollar ore and under is to be delivered in Salt Lake for seven dollars per ton. Between 30 and 50 a little higher rate will be charged. Above 50, the present rate is to prevail. This is a very important move for Eureka, and means, we believe, the beginning of a new era of prosperity in our district. We are assured that Salt Lake smelting men will construct sampling works here within the next 30 days. Now let prospectors go to work. The trust no longer owns the country.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Sept. 6: North drift, 250-foot level, extended 20 feet.

DEL MONTE.—North drift, 225-foot level, extended 13 feet. The face looks favorable. Joint crosscut, 225-foot level, extended 15 feet; face still in vein. Main north drift on the 100-foot level extended 18 feet; face shows some high-grade ore.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 18 feet; water remains about the same.

COMMONWEALTH.—150-foot level: Face of east intermediate drift from 15 upraise has been advanced 13 feet, in ledge matter showing good ore in face and top of drift. No hanging-wall encountered yet. 300-foot level: North gangway from the shaft has been extended 11 feet, through a hard porphyry formation.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 15 feet; the face is still in vein. South drift on the 100-foot level extended 19 feet; total length, 125 feet. The face shows about the same.

NAVAJO.—The crosscut from south drift, 350-foot level, extended 16 feet. Upraise south end, same level, extended seven feet. The ore is somewhat narrower.

GRAND PRIZE.—Water lowered 17 feet during the past week. Concentrator running steadily and doing good work.

Jumbo District.

A DRAFT AT THE WILD GOOSE. — Virginia *Chronicle*, Sept. 4: A draft of seven men was made at the Wild Goose mine September 1. There are still three men employed in the work of development. The owner of the Wild Goose had decided to drive a drain-tunnel about 1000 feet in length, that would tap the ground in the vicinity of the shaft, 200 feet below the present workings, which are on the water level, but owners of adjacent mining locations objected to his driving a tunnel through their ground, which will be necessary to get a sufficient depth for drainage purposes, and for this reason the project was abandoned.

ALASKA.

YUKON MINERS.—A story has been started that 400 miners were wandering about in Alaska, on their return from 40-Mile creek, and unless relief was sent, would perish of cold and hunger. M. R. Johnson of this city discredits the story and says: The diggings are on the banks of creeks which flow into the Yukon. All along the river from its mouth there are settlements, one of which is only about 100 miles from Forty-Mile creek. There are provisions in plenty, as, besides those the miners take with them, other provisions are furnished by two small steamers, one of three and the other of seven tons, which make trips up the Yukon. The miners can do no work in the winter on account of the freezing of the ground, and so they center from all the diggings at a settlement during the winter months, waiting for the ground to thaw out. Provisions are cached and stored at points along the river, so as to guard against the possibility of a shortage. The Yukon is closed for navigation by the ice in October and so remains until April. If any of the men desire now to leave the diggings, therefore, they can sail down the river. At the mouth of the river on the coast are some Indian villages, and not much more than 100 miles northward on the coast is St. Michael's, which is the general fitting-out point for the Alaskan miners. There the men could refit themselves or take the steamer for southern ports. It is 1000 miles from Juneau to Forty-Mile creek, where the diggings are, and the trip takes three months. That any of the men should have contemplated an overland trip to Point Barrow from the banks of the Yukon, is considered so preposterous as to be laughable by those acquainted with Alaskan territory.

ARIZONA.

MOHAVE MINE.—*Miner*, Sept. 7: Bolan & Barkel shipped this week a carload of ore from the old La Port mine, Mineral Park. The Keystone mill, Mineral Park, is running day and night on tailings. The following lots of ore, consigned to F. L. Smith, will arrive the first of next week: Indian Boy, one carload; Queen Bee, six tons; Sabbath Bell, seven tons. E. F. Thompson came in from his Empire mine, Chloride, on Tuesday. He is still pushing the north drift through good ore. The Little Boy mine, at the head of Todd basin, was sold on Friday last to Thomas Knight of San Francisco. W. F. Grounds of Music mountains has arranged his arastra for a constant discharge over plates. It is driven by steam, and with heavy drags he finds no difficulty in putting through two tons in 12 hours and works it up to 85 per cent. Supt. Genung of the Keystone mine, Mineral Park, is still sinking the Congress shaft near the mill. This is an immense ledge, and the action of the company in the past lends the impression that when crosscutting becomes necessary they will get tired before either wall is encountered. McCall & McKinnon have resumed work on their Sunset mine, Chloride, and have encountered a body of high-grade ore. Jas. Twiggs and Jack Kelly are drifting on fine ore in their gold mine near Cerbat. They have already extracted a large quantity of ore and will be able to put several men in the stopes when the drifts are completed. Supt. Bowers, of the Night Hawk, Layne Springs, reports the mine as producing some of the finest ore yet taken from the claim. The cost of sinking the last 50 feet was $25 per foot by contract, the mine furnishing everything except powder and candles. Geo. N. Conard, superintendent of the Little Boy mine, Todd basin, has a force of nine men at work making connection between the main shaft and lower tunnel, which will have to be driven about 250 feet, while the shaft will require to be sunk an additional 30 feet. It is the intention of the new owners to work the mine through the lower tunnel and thus avoid hoisting. A boarding and bunk-house for the accommodation of the miners is being erected. At the sampling-works during the past week the following lots have been run: Jesus Madrille, four tons from the Diamond Joe; F. Martinez, two tons from same mine; I. Hamlin, five tons lead ore; T. Myers, two tons from C. O. D.; W. E. Steadman, Daggett, six tons; Thos. McMahon, three tons from the Young Hyson; Geo. Miller, a lot of high-grade ore from the Weaver district; four carloads from the C. O. D. The sampling-works started to-day on 125 tons of ore from the C. O. D. The C. O. D. mine is looking good and employing about 50 men, though a considerable portion of that number are chloriders, who are doing remarkably well, while the company is taking out large quantities of ore from its reserves.

COLORADO.

NOTES.—Georgetown *Courier*, Sept. 7: A plant of machinery is being erected on the Orient. The Syndicate is working four men, prospecting the vein for ore. The Snider is turning out some very good ore. Five men employed. The Murray mine is to start up again, this time under the management of J. J. Yeckel. Water is being taken out of the Free America extension shaft for the resumption of work. The 60-foot tunnel on the Pioneer, Mill creek, is being put in shape preparatory to extending it 200 feet farther. The Jo Reynolds is erecting a new engine-house, 28x28 feet, and we understand a new and larger plant of machinery will be put in. The contract to sink the Schwartz shaft on the Red Elephant another lift has been completed, and the thirteenth level started. A crosscut has been started from the twelfth level to the Free America. Seven men are employed in the West Albro, and have two cars of ore ready for shipment this week, which mills well in gold, silver and copper. Covellite, an indigo-blue copper ore, occurs quite abundant in this mine in the form of a powder. The cost of producing an ounce of refined silver is from 75 to 80 cents; an ounce of gold from 10 cents to $1, according as it is free-milling or otherwise, so that the cost of production of gold and silver is no standard for estimating their commercial value. The Kaverne is being worked by four parties of lessees, employing nine men. The property is developed by a 300-foot shaft and two sets of levels, the lower one 200 feet from surface. The lessees are stoping from the second level up, and taking out ore milling from 3 to 4 ounces gold, 40 ounces silver and 9 per cent copper. The Mary Foster mine, Ute creek, is operated by the Yarmoth Mining Co. of St. Louis, under the superintendence of W. S. Swain. The company is said to be making extensive improvements and development. The following mines marketed ore in Georgetown during the month of August: Corry City, Kirtley, Everett, Burrell, Two Sisters, Pelican, Pay Rock, 7:30, Brown, Coin, Dunderburg, Dives, Virginia City, Jackson, Independence, Mendota, Luella, McClellan, Saxon, Native American, Comet, Glasgow, Backbone, Magnet, Hood Centennial, Silver Cloud, Mineral Chief, Hall, Hidden Treasure, Big Blue, Little Giant, Paymaster, Equator, Mammoth, Wyoming, Corvin, Illinois and Colorado Central.

DAKOTA.

TAILINGS SHIPPED.—Deadwood *Pioneer*, Sept. 4: Some 5000 pounds of Golden Reward tailings, assaying $20.60 per ton, were shipped from the site of the Deadwood reduction works a day or two ago. Tailings go to Denver, where they are to be tested in ton charges by the Newberry-Vautin process.

UNCLE SAM BULLION.—Dr. Harding and C. H. Lewis came over yesterday with a $9000-brick, representing cleanup from the 20 stamps dropping at the Uncle Sam during month of August. Developments at the mine progress satisfactorily, and more stamps may be dropping before Oct. 1.

SEABURY SHIPMENTS.—Deadwood *Pioneer*, Sept. 7: The Seabury-Calkins Co. shipped a carload of $70-ore to Kansas City yesterday, and have six more carloads on the dump and broke down ready to hoist. They have some difficulty in securing transportation from the mine to Whitewood.

IRON HILL. — Delay in arrival of slag pots ordered has prevented the plant blowing in for dry or pyritic smelter. All necessary changes preliminary thereto have been completed, however, and as Superintendent Bamberger has returned to camp, it is probable fires will be lighted in a few days.

CHLORINATION WORKS. — Krom rollers, purchased from the Welcome, have been placed at the Keystone Chlorination Works. The Harmony Co. has secured a 90 days' extension of its lease, and will resume treatment of ore on Monday next.

IDAHO.

COPPER.—Ketchum *Keystone*, Sept. 7: A. H. Dollarhide, the well-known mining man, returned last Sunday from a visit to the Samoa copper mining district, which is located near the east fork of Lost river. Mr. Dollarhide made a pretty thorough examination of the copper deposits of that district, and also informed himself in regard to the probability of silver-lead-bearing lodes existing in the vicinity of the copper camp. He says that the copper lodes or deposits are immense upon the surface, and the ores carry a large percentage of copper, besides a good percentage of silver with some gold. Plenty of timber and water close at hand afford every facility for reduction works near the mines. Mr. Dollarhide found no favorable indications of there being other mineral-bearing lodes in that locality, and thinks that the copper zone is a distinct formation by itself, and that the nearest silver-lead bearing mine is the Star of Hope, a distance of about ten miles from the copper mine, and of which he speaks very highly. The townsite of Samoa, which has been recently laid out at the copper camp, is in close proximity to the mines. Mr. Dollarhide estimates the distance from Ketchum to the copper mines to be about 40 miles.

BANNER.—Idaho *World*, Sept. 6: N. P. Fassett and son, Ed T., and C. Presswick, of the Elmira Silver Mining Co., returned Wednesday from Banner, where they have been the past few weeks, and left yesterday for their home in Elmira, N. Y. Mr. Presswick called on the *World* just before starting. He says the tunnel on the 400-foot level of the Crown Point and Wolverine mines has been driven 400 feet, all in pay ore, and the end of the chute has not been reached. They now have a seven-foot ledge that runs $70 per ton. A tunnel is being driven west from the 300-foot level into the Crown Point ground. This ground cannot be worked at present on the 400-foot level, on account of a big flow of water. The Co. has concluded not to put a new hoist on the Banner until next season. The Wolverine is now turning out ore faster than the mill can crush it, and there is enough ore in sight in this and the Wolverine to keep the mill going for a long time. Experienced miners estimate that the ore body already opened in these two claims, which are on the same vein, will yield $2,000,000.

LOWER CALIFORNIA.

COAL ON THE PENINSULA.—*Lower Californian*, Sept. 4: There is no doubt that coal exists in Lower California, for it has been found in small veins on the coast and also on the desert. The vein found at Sauzal is right on the shore, and not more than a foot in thickness. It has been examined by Engineer Tyzack and others, and assayed in Washington, and all pronounce it good coal. For years it has been well known that coal exists in small seams near San Felipe, on the Gulf, but no thorough prospecting has ever been done in that section, and it is therefore not known what we may expect. The officers of the U. S. Coast Survey steamer Ranger reported two years ago that they had found good veins of coal just below Point Canoas. Two different parties made the attempt to go and examine the district, but failed, and it is still unprospected and unknown. An old German geologist and coal expert has been wandering over the country between the pineries and the Colorado river, and he reports that a big coal measure is to be found south of the Cocopah mountains; and that he found coal beneath the dunes and shifting sands of the desert—all of which would seem to indicate that there is coal on the peninsula in paying quantities. While we do not credit the stories of gigantic veins 25 feet thick and 25 feet high, as late newspaper reports have it, we believe that experienced prospectors would be amply repaid for labor spent in finding coal; for a good coal mine here would pay better than an Alamo gold mine.

NEW MEXICO.

LAKE VALLEY.—Silver City *Enterprise*, Sept. 7: From Walter C. Hadley, manager of the Lake Valley mines, who is in the city, the *Enterprise* learns the following: The plant of the Lake Valley Co. is now running steadily, and treating about 60 tons of ore per day. The rolls have given place to the battery. Mr. Hadley has been experimenting for several months with the old lixiviation process, and has fully demonstrated a capacity of 60 tons. This has been accomplished without any direct appropriation from the company, and as it is now working successfully, the company will certainly supply the necessary funds to perfect the mechanical construction of the plant. Through this leaching process, an average of 83 per cent of the metal is now saved. The finest air-compressing plant in the Territory is now working in the mine. About 100 men are employed in the mines and mill, of which about 30 are leasing. The lessees have never met with very good success, although the average value of the ore shipped is from 75 to 83 ounces. One car of ore, besides that treated in the mill, is shipped every four days. A race with water is being run at the Graphic, Cook's peak. The new pump has a capacity of 8000 gallons per hour, and it is lowering the water slowly. The mine is opened up in good shape, and is more than paying expenses. The Oro Fino claim, in the Animas district, was sold last week for $20,000. Billy Purple, a deputy sheriff, was one of the owners. It was purchased by St. Louis parties. Clerk Webster is taking out some excellent ore from his Log Cabin mine, which promises to be one of the bonanzas of the county.

MONTANA.

HOPE.—Phillipsburg *Mail*, Sept. 7: It is now definitely understood upon good authority that the Hope mill will start up on the 15th, and will continue to run without interruption for some time to come.

GRANITE MOUNTAIN.—The output for the week ending Sept. 6 was 53 bars of bullion, containing 78,800 ounces fine silver and 166 ounces fine gold. The proposed ten additional stamps are being placed in mill B at Granite, which will enable them to work about as much ore as they do in the Rumsey mill.

COMBINATION CO.—The rebuilding of the hoisting works, etc., of the Combination Mining and Milling Co. at Back Pine, destroyed by fire last Saturday evening, will be commenced at once.

GEORGETOWN MINING AND MILLING CO.—An incorporation to be known as the Georgetown Mining and Milling Co. was organized in Phillipsburg during the past week. They have already commenced active operations on their properties, which include the Great Republic and Matildy lodes, adjoining the Red Horse in the Flint creek district.

LITTLE BLACKFOOT DISTRICT.—A. A. McDonald made a trip from Phillipsburg to the Little Blackfoot district this week, where he has lately become interested in the mines of that section. Mr. McDonald, like many others who have visited the camp, is highly pleased with the outlook. Men were put to work recently on the Emma and Carpenter lodes, which are among the claims that Mr. McDonald is interested in. A splendid showing of ore is in sight in the tunnel, and the owners are confident that they will eventually have a big mine. The Connor Bros. are the owners of another promising property in this district. All the ore in the camp is gold and silver bearing, and unusually high grade.

UTAH.

RUMORED STRIKE.—Park *Record*, Sept. 7: Rumors to the effect that a four-foot vein of clean ore was struck in the face of the south crosscut of the Anchor on the drain tunnel level the middle of the week were flying around town. In Salt Lake report had it that the ore struck assayed 70 per cent lead and 30 ounces silver to the ton, but the truth of this rumor could not be verified at headquarters. On authentic information the *Record* is able to state that the rumor is a little premature, and that the indications are considered so much more favorable that the vein is likely to be struck any day. When the Anchor vein is cut on the tunnel level this paper will say so.

THE GLENCOE TO BE WORKED.—Col. M. Shaughnessy, the principal owner of the Glencoe property, in Blue Ledge district, arrived from Salt Lake last evening. This morning, in company with C. P. Mason, manager of the Utah & Montana Machinery Co., E. A. Shear, the millwright, and L. W. Young of New York, went up to the mine. To the reporter the Colonel said it was the intention to resume work on the Glencoe shortly and build a concentrator to make marketable the great amount of low-grade ore in sight.

CAMP CROSSCUTS.—The Crescent tramway is running again in full blast. Ore was cut in the bottom of the Woodside shaft last evening at a depth of about 65 feet. The Mayflower and Woodside paid off their employes this week and Daly and Ontario pay-days are expected to occur within the next ten days. Some very encouraging developments have been made recently in Tait & McFalls' Aerial tunnel and in the New York group, which are above and southeast of the Ontario. It is calculated that the 3000-ton lot of Alliance second-class ore which is being sent down to the Union concentrator will yield 600 tons of concentrates worth from $60 to $75 a ton in the market.

MECHANICAL PROGRESS.

American Tin-Plate Manufacture.

There has been much discussion for several years past in regard to the practicability of establishing the industry of tin-plate manufacture in this country. It has been very generally conceded that the industry might be made practicable with a very small addition to the present tariff tax upon the imported article, but a few have argued that the business might be made profitable at the present tariff rate, and no doubt it might be if English manufacturers would stand at their present prices. But experience has shown that whenever any decided attempt was made to establish a new industry in this country, of which the English had previously held a monopoly, the American agents were immediately instructed to put down the price of the article to a much lower figure than it had previously been sold at, with the hope to strangle the new industry in its infancy. Manufacturers have often formed combinations and sold their goods in this country, under such circumstances, with transportation added, cheaper than the same goods were sold at home.

Under such a condition of things, the promoters of the new home industry have been compelled to exercise the utmost economy in the manufacture, and often are able to continue the business only through the invention of new and improved devices for carrying on the same. This was notably the case in the early establishment of manufacturing in this country soon after the war of the Revolution.

The recent discovery of tin in Dakota, however, with the still more recent demonstration of its great abundance and cheap product, seems to have infused new life into the efforts to establish the home manufacture of tin-plate. A company of capitalists has been formed in Pittsburg, Pa., which has commenced the erection of a plant, with a view of demonstrating the ability of the United States to manufacture tin-plates, the work upon which is being rapidly pushed forward. The subscribers are so confident of the success of the scheme that they have felt themselves justified in placing the matter in the hands of the American Tinned Plate Association to push the same to completion. A meeting has been held of those who have been practically engaged in the manufacture of tin-plates, both in America and England, to suggest methods for operating the plant.

At the coming exhibition of the Pittsburg Exposition Society there will be a practical demonstration of the process of the manufacture of tin-plates. The *American Manufacturer* thinks that the development of the industry in the States will have a great influence in inducing Congress to give it the protection asked for in the Senate bill, and which is necessary in order to establish the industry here.

A London (Eng.) contemporary laughs at the proposed exhibition of tin-plate manufacture at the coming Pittsburg Exposition as a "microscopical" affair when arrayed against the great tin-plate factories of Great Britain. "Let those laugh who win," and "he laughs best who laughs last," are old proverbs. If our statesmen are true to the people, the day is not far distant when foreign tin-plates will find no more markets in the United States.

Works for the manufacture of the plates to receive the covering of tin are already in operation at McKeesport, Pa., where iron plates of all descriptions will soon be turned out on a large scale. These works have recently been greatly enlarged, and two-thirds of the works were quite recently again put in operation, at which time the big new 44-inch plate-mill was put in operation also.

American tin-plate, when put on the market will be of a superior quality to the English plate, as it will consist mostly of steel-plate, which will be much more durable, and but little if any increased in cost. In this connection we notice the following from a Chicago paper: "The Illinois Steel Company, with its large capital will, at a day not very remote, enter upon the manufacture of tin-plate. This is proper. The tin in Dakota and at other places which exists in large quantities, is at last to be utilized, and Chicago is to become the center of the new and important industry. Besides the tin discoveries made in this country, it is well known that rich tin mines exist in Durango in Mexico, and when our own mines fail to yield a supply we can draw upon the rich lodes said to exist in the mines of our neigboring republic."

There were imported into this country in 1888 over 332,615 tons of tin-plate. This meant 900,000 tons of ore; 500,000 tons of coke for furnace use; 450,000 tons of pig iron; 1,250,000 tons coal or its fuel equivalent in the sheet and tin mills; 333,615 tons of sheet iron and sheet steel. As this is all labor it meant $30,000,000 of earnings that should have been distributed among American laborers.

The English paper above quoted need not be astonished if within three months after tin-plate has become an established industry on a large scale in the United States—as it is bound to be—the American processes of manufacturing the plates shall be far more simple, rapid, complete, and every way superior to the best methods now employed in Wales. The Americans are progressive, and brains and money are freely expended in providing all necessary improvements upon ordinary systems of production.

The Sheet Metal Manufacturers.

Improvements in the methods of manufacturing sheet-metal goods have made such rapid progress during the past few years, says the *Export World*, that many machines heretofore in general use and highly esteemed, have been replaced by others of still more improved design and construction and of increased efficiency, enabling the manufacturer to accomplish by machinery, with low-priced labor, far more and better work than was formerly accomplished with much high-priced labor by the inferior methods.

Many articles that were then spun by hand on a lathe, requiring an expert operator, are now cut and drawn into shape in one or more operations by a press and dies, with a rapidity, uniformity and cheapness impossible by hand-spinning. The use of heavy sheet brass and open-hearth sheet steel has become quite general in the manufacture of a large variety of small goods, formally made of malleable iron forgings or brass castings, and has improved the appearance and reduced the weight as well as cost of the articles.

In the manufacture of sheet metal goods, the machinery planned and constructed in the United States leads the world. Designs produced here have been copied in England, Germany and other European countries; but the development has been so rapid that it is noticed that by the time one machine is copied its particular pattern has been discarded for a better one, so that the European maker who attempts to keep abreast of those in the United States finds himself continually distanced in the race. Designs of most machinery for this line of manufacture are far less attractive in appearance and finish, have less symmetry, and the make does not always seem to be placed where most needed. This criticism applies to both English and German productions; and also, though to a less extent, to some French machines. It is, no doubt, because of superiority in design, construction and general efficiency that the demand for American presses has so largely increased in Europe during the past few years. Within two years a very large amount of sheet-metal working machinery has been exported to Great Britain, France, Germany, Holland, Italy and Russia, as well as to Australia and South America.—*American Artisan.*

POPULAR BELIEF THAT COLD MAKES STEEL BRITTLE.—Stuffe, Fairbairn, Kirkaldy, Webster, the United States Government Commission, the railroad commision of Massachusetts, and others, all hold that the effect of low temperature upon iron is very slight and that it does not tend to produce a brittle condition. Sanberg is the only one who claims that low temperatures have any pronounced effect in producing brittleness, that is, he is the only one among recognized authorities; but if you have ever been out in the woods on a cold, frosty morning, you may have noticed that the axman warms his ax before beginning work. Ask him why he does so, he will reply, "To take the frost out." Watch the trackman on on a cold morning; he is very careful not to strike his cold chisel too hard, and neither does he cut so deeply into the rail, before dropping it to break it, as he does in warm weather; ask him why, he will say, "the chisel and rail are full of frost and will brake more easily than in warm weather." The same thing will be noticed with the men who are unloading steel rails or wheels and axles. They are more careful to let them down easily in cold than in warm weather. You may say, "But that is a popular fallacy." It may be so, but those men have had some experience which has led them to this opinion, and I am afraid there is more truth than fallacy in their claim "that frost in the iron makes it brittle."—*Ramsay on "Effect of Cold on Metals."*

THE FUTURE OF THE STEAM ENGINE.—In a recent issue of the *North American Review*, Prof. R. H. Thurston of Cornell University, an authority on the subject of steam engines, expresses it as his opinion that this invention is capable of vast improvement, and that it has not yet begun to exhaust its inherent powers. On the basis of greater developments in the application of inventions to the steam engine, Prof. Thurston predicts that the next generation will see it consuming one pound of fuel per hour for a single horse-power; that ships of 20,000 tons will be driven at the rate of 40 miles per hour; that the American continent can be spanned by flying trains in two days, and that transportation between the cities of the Atlantic and those of the Pacific Coast will be so cheap that the general average of living will be vastly improved upon what exists today.

ECONOMY IN SPEED.—An experienced machinist says: "A shaft of half the weight, running at twice the speed, will transmit just as much power as one of full weight and slow speed. There is an actual economy of many items resulting from the use of shafting of small diameter running at high speed. There is economy in the purchase of the shafting; second, saving in couplings and hangers which will be lighter; third, pulleys transmitting a higher speed will be smaller, hence lighter; fourth, the belts traveling at high speed will be smaller and lighter; and fifth, the building supporting such light transmission can be lighter and cheaper, and there are many more advantages."

SCIENTIFIC PROGRESS.

*The Vital Theory.

It seems to be the tendency of the present scientific world to believe nothing which it cannot see. Therefore, its leading men deny the existence of certain laws and forces on the same ground that the unorthodox chicken took when it denied having been in a shell. In common with this idea, the dominant cultivators of medicine have decided that there exists no laws or forces in physiology or pathology which cannot be determined by physico-chemical processes. One of the recent writers, Gerold F. Yeo, who is Professor of Physiology in Kings' College, London, under the date of 1888, says: "The laws which govern the motions of inanimate bodies also control the actions of living tissues, for we cannot claim to recognize the existence of any laws affecting the human organization other than that known to be applicable to dead matter. There are a great number of activities shown by living textures which we cannot explain by the recognized laws of physics or chemistry. We, therefore, use for convenience sake the term 'vital phenomena' to indicate processes which are beyond our present physical and chemical knowledge. When physiologists make use of the convenient term 'vital phenomena,' it must be remembered that they do not thereby imply the existence of a special living force or any kind of energy peculiar to human creatures." Thus in a few words he outlines clearly and plainly the stand taken by his fraternity against the vital theory. Right here comes the cardinal point of differences in the belief of the regular and of the heterodox physio-medicalist. We believe there are laws which govern the functions and control the existence of living tissue which differ *toto cælo* from any that maintain power over dead matter. To deny the existence of such law or force because we cannot see it, chemically analyze or mathematically demonstrate it, is as foolish for scientists as it is for the Rev. Jasper to declare "the sun do move."

The human organism, and for that matter all living organisms, are built up and maintained in action by the vital force, living power, law of living tissue, or whatever you may choose to name it. Just what the force consists of I know not. It is inherent in the living tissue, and is, in fact, the one thing which constitutes the difference between a live body and a dead one. To it are the functional activities due. It is the stimulating power of the organism. Wherever we find life, be it animal or vegetable, from the undifferentiated protoplasm upward, we see the manifestations of this law. I cannot formulate it nor explain how it comes to be present in tissues any more than you can explain the *modus operandi* of crystalization which carbon passed through when the diamond was formed. When science is able to answer that question, it will be able to make living tissue at will.

In discussing this subject not long since, it was claimed that the progress of physiological investigation during the last few years had determined so many processes to be chemical which had been supposed to be vital, that we had good reason to expect that within a short time the mode of activity of living beings and the relation of living phenomena to the laws which govern them would be entirely settled on a physico-chemical basis. Anyhow it was maintained the discoveries made so far did away with any hope for the vital theory. If this were the case, there would be no more mystery concerning man's existence and the performance of physiological action than there is concerning the composition of water and the capabilities of its power. The working out of the chemistry of nutrition, of muscle or nerve waste and repair, of respiration, and of circulation helps, rather than retards, the vital theory. The existence of chemical laws in application to living tissue is not incompatible with the existence of a vitality which is separate from that produced by chemical combustions. It is not in the structure of tissue nor in the preparation of material for repair that the action of the vital force is seen. It is rather in the capability of tissue to carry on the merely chemical processes that it is to be recognized. The processes of nutrition which were long supposed to be vital are daily being turned into those of chemistry. But while we are learning the changes which food undergoes in order to be capable of sustaining our bodily existence, we have not learned how it is possible for these combinations to do the work and maintain life.

What it is that causes the parts of a living organism to undergo change into effete material, and what it is that gives to those parts the power of self-generation when new matter is presented under proper conditions, are questions that will never be answered by any physical or chemical experiment that it is possible to devise. No real progress has ever been made in science as long as the investigators have mistaken the effect for the cause. The analysis of the phenomena of physiology is not the investigation of their source. We can reason from effect back to cause; we learn by experiment that it is different from anything in the realm of physical science because there is nothing there that will produce the same results for any considerable length of time. There are forces in nature too delicate to be appreciated or seen save through external manifestations. That the vital power is one of these is proven in many places. Take, for instance, the experiments upon muscle. A muscle taken from a warm-blooded animal soon loses its irritability unless efforts are made to renew its functional activities, which may be done by passing an artificial stream of arterial blood through its vessels. The same result may be brought about by using a mild saline solution, say six per cent sodium chloride, but after these have been resorted to once or twice, the muscle loses irritability, or rather becomes completely fatigued—in a word, the muscle is dead. If the irritability is due, as many say, to the chemical action of the arterial blood, why does it fail after one short trial? Fatigue, or death, is produced, the anti-vitalists say, by the clogging up of the effete material produced by functional activity, and which have not been carried away. To the cleansing out of this matter they lay the efficacy of the irrigation with arterial blood or the salt solution. If irritability and fatigue, or in other words, life and death, depends solely upon chemical action or equilibrium of the blood in keeping a continual stream flowing so that the "fatigue matters" cannot accumulate, why does not the passage of this continual stream by artificial means serve the same end? The laws of chemistry are exact. If chemistry held the key to the solution of the problem, it would never fail. But what is fatigue? They answer, it is the loss of irritability—a mere negative term. What causes it? The clogging up by effete matters, the weakening of irritability. In short, when physico-chemical investigations have reached this point, they can go no further, but must tramp the same circle of function, irritability, fatigue, again and again. Is it any wonder, for here is the riddle of the ages. What is death? The absence of life. What is life? The state of an animal or plant in which its organs are capable of peforming their functions. There is the limit. What the difference is between live tissue and dead we know not, except that one is capable of work and the other not. What causes this capability is unknown, but it is beyond chemistry and physics. If there are no laws governing living organisms excepting those controlling dead matter, why are there such things as irritability and fatigue?

There is a law or force affecting living tissues which does not control dead matter, and that is the Vital Force. What it is, is undetermined. So far it has proven impalpable and unsearchable, but the difference between its existence and non-existence is the difference between life and death.

*By J. E. Roop, M. D., in the *Physico-Medical Journal.*

A CURIOUS CHEMICAL.—A new substance, singularly alike in its chemical nature and its properties, says *Nature*, has been discovered by M. Pechard. It is a mixed acid derived from oxalic and molybdic acids, and is, therefore, termed "oxalomolybdic acid." The crystals of oxalomolybdic acid, when dry, may be preserved unchanged either in sunshine or in the dark; but if moist they quickly become colored blue when exposed to the sun's rays. If characters be written on paper with the solution they remain invisible in a weak light; but when exposed to sunshine they rapidly become visible, turning into a deep indigo color. It is curious that this effect only happens when the solution is spread over paper or other surfaces; for the solution itsefs may be kept unaltered in the bottle for any length of time, except for a trace of blue at the edge of the meniscus, where, by surface action, a little is spread against the interior glass walls. If a sheet of paper be immersed in saturated solution of the acid, dried in the dark and then exposed behind an ordinary photographic negative, a very sharp print in blue may be obtained by exposure to sunlight for about ten minutes. The color instantly disappears in contact with water, so that if a piece of this sensitized paper be wholly exposed to sunlight one may write in white upon the blue ground by using a pen dipped in water. If, however, the paper with its blue marking be exposed to a gentle heat for a few minutes, the blue changes to black and the characters are then no longer destroyed by water.

SUBSTITUTES FOR LUMBER.—Two announcements were recently made in a single week looking toward a saving of waste, and provisions against a sure coming scarcity of timber. Our forests are unreasonably wasted; but man's inventive skill will meet the crisis successfully. One of these inventions provides for the making of sugar barrels of the refuse bagasse of the sugar factories, and the other for the making of boards of a mixture of reeds and plaster of Paris, shaped by hydraulic pressure. Here are substiutes for timber that suggest the possibility of many more; still there is no reform now more needed than to put an end to forest destruction.

SOLID SULPHURIC ACID.—Herr Bickmann has patented in Germany a process for enabling sulphuric acid for manufacturing purposes to be safely transported. He takes advantages of a property of certain salts—of which alkaline sulphates are representatives—by which they give up their water of crystallization when heated, and take it up again when cool; and he does so by mixing the salts in an anhydrous condition with a calculated quantity of sulphuric acid. The whole mass becomes granular, or may be formed into cakes, and when heated, the whole liquefies and may be used as if it were sulphuric acid, for the presence of bi-sulphate of soda does no harm.

GOOD HEALTH.

Want of Sleep.

Are you afflicted with insomnia? Perhaps you have too much time for sleep; perhaps you depend too much on sleep for rest and recuperation—for sleep is not the sole rest of used-up nerves. Sociability, congeniality, and the enjoyment of good company rest the body quite as much as sleep.

The dreary monotony of life in many a household, involving this tumbling into bed with the mechanical regularity of a machine at nine or ten o'clock in the evening, does not always rest weary bodies. "Early to bed and early to rise" does not always make a man healthy, wealthy or wise.

Numbers of organizations are capable of only five or six hours' sleep at a time, and their early lying down to rest is often succeeded by an early waking up and a consequent restless tossing for hours preceding daybreak. The practicers of punctuality are often surprised, after breaking their own cast-iron rules and passing two or three later hours of mirth and jollity past their usual bedtime, to find themselves even more refreshed than usual in the morning. The relaxation of sociability has rested them more than would sleep or an attempt to sleep. But these are conditions not so easily reached in the average family.

In fashionable life we have a formal, exhausting and mechanical evening of more or less dissipation. On the other hand the evenings of great numbers of families are monotonous humdrum. They involve the assemblage of the same people, the same surroundings, the same paterfamilias yawning over his paper, and the same querulous mamma overladen with family cares. Fresh people with fresh thought, fresh atmosphere, anything to stir up and agitate the pool of domestic stagnation, are sadly needed and sadly scarce. There needs to be also a constant succession of such fresh people to bring about these results. The world is full of men and women, and in a better regulated life it would be the business, after the day's work was done, to entertain each other and give each other fresh life. As it is now, hundreds and thousands of our households are little better than cells for the incarceration of each family. Thousands are thus worn out prematurely from the utter lack of domestic recreation. There might be written over the graves of thousands: "Bored to death by the stagnation of domestic life."—*The Christian at Work.*

How to Secure Pure Water.—The only sure way of securing pure water for drinking purposes is to boil it before using it. The *Medical News* of New York lately printed an exhaustive report on the efficacy of filters and other means to purify drinking water, by Dr. Chas. G. Carrier. It was read before the section of public health of the New York Academy of Science, and has been republished in a pamphlet. The author, who calls his paper a bacteriologicol study, makes several statements that may be familiar enough to students of science, but which are at variance with popular notions. Thus it is asserted that clear, sparkling water may be the most harmful of beverages; that polluted water may be agreeable to the taste and have no visible sediment, yet cause many deaths; that it may be highly colored, but showing no very large number of bacteria, and so be harmless to those who drink it. To detect the presence of harmful agencies in drinking water is practically impossible for more than one in a thousand. Therefore, when a given supply of water is found to be unwholesome, means to rid it of its dangerous qualities are peremptory, and the readiest appliances are filters, of which there is an immense variety. Or the water may be filtered on a large scale before it reaches the user's premises. Dr. Currier, however, points out that bacteria may find their way through any filtering material, and that the only sure way to have water that can be drank without risk is to boil it after it has been filtered. The muse is again snubbed by the man with the microscope, who shows slips in the teakettle between the old oaken bucket and the lip.

The Beer Drinker.—In appearance, the beer-drinker may be the picture of health; but in reality he is most incapable of resisting disease. A slight injury, a severe cold, or a shock to the body or mind, will commonly provoke acute disease, ending fatally. Compared with other inebriates who use different kinds of alcohol, he is more incurable and more generally diseased. It is our observation that beer-drinking in this country produces the very lowest kind of inebriety, closely allied to criminal insanity. The most dangerous class of ruffians in our large cities are beer-drinkers. Intellectually a stupor amounting almost to paralysis arrests the reason, changing all the higher faculties into a mere animalism, sensual, selfish, sluggish, varied only with paroxyms of anger senseless and brutal.—*Scientific American.*

How Women Rest.—How differently men and women indulge themselves in what is called a resting spell, says the New York *Graphic*. "I guess I'll sit down and mend these stockings and rest awhile," says the wife; but her husband throws himself upon the easy-lounge, or sits back in his arm-chair, with hands at rest and feet placed horizontally upon another chair. The result is that his whole body gains full benefit of the half hour he allows himself from work, and the wife only receives that indirect help which comes from change of occupation. A physician would tell her that taking even ten minutes in a horizontal position, as a change from standing or sitting at work, would prove more beneficial to her than any of her make-shifts at resting. Busy women have a habit of keeping on their feet just as long as they can, in spite of backache and warning pains. As they grow older they see the folly of permitting such drafts upon their strength, and learn to take things easier, let what will happen. They say: "I used to think I must do thus and so, but I've grown wiser and learned to slight things." The first years of housekeeping are truly the hardest, for untried and unfamiliar cares are almost daily thrust upon the mother and home-maker.

Yellow Fever.—The yellow fever is one of the varied forms of the typhus, the name being derived from the hue of the victim, while the Spanish call it *vomito negro*—the black vomit—from one of its symptoms. Its home is tropical Africa and tropical America, but it is never found in India and China, hot as the climate may be. The cause of this difference, however, has never been explained. Its greatest prevalence is on the sea coast or banks of navigable rivers. Its ordinary duration of attack is from 36 to 48 hours. The yellow tinge first appears in the eye and then spreads over the face, gradually reaching the extremities and often becoming dark brown. The rate of mortality varies in a striking degree, for in some places one-third of the cases prove fatal, while in others the mortality reaches two-thirds, and then at other times it has not exceeded three per cent. Treatment varies more in this disease than in any other, which is a proof that thus far it has baffled the best practitioners. Like all other forms of pestilence, it not only walketh in darkness but destroyeth at noonday.

The Health of Railway Men — The health of railway men does not seem to be a healthy, nor yet an enjoyable one, if any reliance is to be placed on the observations of medical men who have given some attention to the subject. According to M. Duchesne, railway men improve in health during the first four years, but at the end of ten years they are tired out, in 15 they are actual sufferers, and few can remain in the service after 20. These general conclusions have been supplemented by Dr. Lichtenberg of Buda-Pest, who found from examination that, out of 250 railway employes, 92, or more than a third, suffered from ear disease. Engine-drivers are especially liable to rheumatism and pneumonia, and after some years' service a certain proportion of them become dull of sight and hearing. Others suffer from a mild form of spinal concussion, muscular feebleness and continuous pains in the limbs. They are also apt to develop a peculiar mental state—a sort of cerebral irritation—with excessive nervousness and morbid sensation of fear.

USEFUL INFORMATION.

Mixtures for Brass Castings.

An English paper gives the following as the proportions of the different metals used for brass casting in a prominent English locomotive works:

Brass for side rods—Six pounds of copper and one pound of tin; to 100 pounds of this mixture add one-half pound of zinc and one-half pound of lead.

Brasses for driving boxes—The same as for side-rod brasses.

Some master mechanics prefer harder brasses, and call for five pounds of copper and one pound of tin, one-half pound of zinc and one-half pound of lead.

Bells—Four pounds of copper and one pound of tin; to every 100 pounds of this mixture add one-half pound of zinc and one-half pound of lead.

Castings subjected to steam pressure—Twenty pounds of copper, 1½ pounds of tin, one pound of lead and one pound of zinc.

Pumps and pump chambers—Eight pounds of copper and one pound of tin; to every 100 pounds of this mixture add 1½ pounds of lead and 1½ pounds of zinc.

Piston-packing rings—Sixteen pounds of copper, 2½ pounds of tin; to every 100 pounds of this mixture add one pound of zinc and one pound of lead.

To Make Wood Fireproof.—If this could be cheaply and effectually done, there are few improvements which would be more largely conducive to the welfare of mankind. The following paragraph, therefore, which has been lately in circulation, may be fairly pronounced "important if true, and interesting at any rate." It is stated that a New Englander has recently discovered a cheap method of dissolving zinc by combining it with hydrogen and producing a solution called zinc-water. This liquid, if applied to certain woods, notably white wood, makes it absolutely fireproof, and at a low cost. Mr. Edward Atkinson, the Boston economist, in speaking of it at Cornell University, says he regards this discovery as one of the most important of the age and one that will surely revolutionize fire insurance, as well as immensely decrease the losses by fire. The invention is kept secret for the present. Only one foreigner, Sir Lyon Playfair, the English scientist, knows of it. He corroborates all that is claimed for the invention, and says that the inventor is a bungling chemist, but that he has a faculty of blundering into the choicest secrets of nature's laboratory. As soon as patents are perfected and capital interested, zinc-water will become an article of commerce.—*Safety Valve.*

To Clean Engravings.—The *American Art Printer* gives two very simple and, as that journal says, very effective methods of removing all stains from engravings: Put the engraving on a clean board and cover it with a thin layer of common salt, finely pulverized; then squeeze lemon juice upon the salt until a considerable portion of it is dissolved. After every part of the picture has been subjected to this treatment, elevate one end of the board so that it will form an angle of about 45 degrees with the horizon. From a tea-kettle or other suitable vessel pour on the engraving boiling water until the salt and lemon juice are entirely washed off. The engraving will then be perfectly clean and free from stain. It must be dried on the board or on some smooth surface gradually, not by the fire or sun. Immerse the print for an hour or so, or longer if necessary, in a lye made by adding to the strongest muriatic acid its own weight in water, and to three parts of this mixture adding one of red oxide of manganese. India ink stains should in the first instance be assisted out with hot water, and pencil marks should be taken out with india-rubber very carefully. If the print has been mounted, the paste on the back should be removed with warm water. Another recipe is: Lay the engraving down on a smooth board with a clean sheet of paper underneath, and with a clean sponge and water wet the picture on both sides and then saturate it well with a soft sponge with the following mixture: A quarter of a pound chloride lime, two ounces oxalic acid and one quart of soft water, and apply.

Curious Growths.—The editor of the Manchester (Mass.) *Mirror* says that Chas. Walker of that place has a curiosity on his grounds which would seem to be a miniature rival to the famous hanging gardens of Babylon. In one of the grand old elm trees which surround his home, and at a distance of about 13 feet from the ground, may be seen growing a currant bush in all the pride of richly-borne fruit. The bush was first noticed in the fork of the tree about three years ago, and this is the first year that fruit has appeared. It must have grown from seed which was carried there by a bird. Another exchange says that a tree was recently felled in the courthouse yard at Johnsberry, Vt., which had a gooseberry bush growing out of its side, upward of 30 feet from the ground. The tree was a maple and the strange growth had been noticed for a year or two, but the precise character of the growth was not known until the tree was cut down.

The Keeley Motor is still on the way. It is estimated that not less than $300,000 have been spent in the work of Keeley's motor, and the end is not yet. Keeley says he has nearly completed what he calls his "provisional engine," and will soon be prepared to make it known and to apply for patents. Meanwhile, the courts having decided that Keeley cannot be compelled to disclose his secret before it is protected by a patent, the stockholders are left to rely entirely upon his promises. He says he has written out his secret so that it may not die with him.

Sawdust Paper.—An important experiment has been made successfully at Ottawa, Ontario. A mill has been established which makes paper pulp out of sawdust. It is now using all the product of one mill. The paper made wholly from sawdust is said to form an admirable sheathing, that is fit for building after being tarred and dried. A better quality of paper is made by using one-fourth waste paper. The plant cost $15,000 and consists of American machinery. The mill has a capacity of converting about 12,000 tons of sawdust into pulp annually.

A Valuable Invention.—It is said that the Secretary of War at Washington recently became so greatly impressed with the value of an original invention (an instrument known as the "hitch-lock"), that at his special request it was hurried through the patent office. Its importance lies in the use to which the Government can apply it. Attached to a telegraph line, any electric message can be sent over the wires to its destination without being heard at intervening stations, and Government secrets cannot be interpreted.

Platinum can be Made to Adhere to Gold by soldering, in the following manner: A small quantity of fine or 18-carat gold should be sweated into the surface of the platinum at nearly a white heat, so that the gold shall soak into the face of the platinum. Ordinary solder will then adhere firmly to the face obtained in this manner.

English and American Capital.—It is announced that while English capital is being absorbed in large American industries, American capitalists are trying to establish a new express and baggage company in Europe. New Yorkers will build a new theater in Paris, and Brooklyn capitalists will erect a hotel in the same city.

ELECTRICITY.

Profits from Electric Enterprises.—As an evidence of the large legitimate profits to be made in electrical enterprises under competent and judicious management, the *Electrical World* instances the case of an electric light and power company established in a city of over 100,000 inhabitants. Some five years ago the company was formed, contracts were signed and the stockholders assessed $80,000 in actual cash to pay for the complete installation, which was then placed in the charge of a young man of known ability, to whom no other instructions were given than to secure the largest possible dividends. The capital stock was then $100,000; within two years it was doubled, and later on was raised to $300,000, though the stockholders have never paid in a dollar other than the first subscription of $80,000. An offer of $260,000 in spot cash has been made for the complete plant, and the average yearly net profits divided during each of the last four years has equaled the original cost of the plant. In other words, were they to sell out for the sum named they would have received a total of $580,000 upon an investment of $80,000 made some five years ago. "Is it to be wondered at," remarks our electrical contemporary, "that capitalists stand ready to invest in any legitimate electrical enterprise? Should the unprecedented activity in electrical circles be a matter of wonder? Even if arc lights do not earn as much now as they did five years ago, the industry is evidently one capable of good returns."

A Magnetic Field.—If, while the electrical current is flowing through a wire, a delicately poised magnetic needle be carried about it, the needle will tend to place itself at right angles to the general direction of the wire. It may be easily shown that the region about the wire is a magnetic region, commonly called a *magnetic field*. In order to do this, the wire may be made to pass vertically through a sheet of smooth paper which is held in a horizontal position. If, then, while the current is passing, some iron filings be sprinkled over the paper, and the latter be gently tapped, so as to assist the movement of the filings, they will arrange themselves in concentric circles about the wire. When the current is interrupted, the region about the wire is no longer a magnetic field, but it may be restored as often as the current is renewed. This simple experimental fact lies at the foundation of many electrical appliances with which we are familiar. The magnetic field about a single conducting wire is, however, generally too feeble to serve for many purposes for which it would otherwise be useful.—*Prof. C. F. Brackett in Scribner's.*

Electricity at the Eiffel Tower.—M. De Fonvielle has made very curious electrical experiments at the summit of the Eiffel tower. Some, it is considered, will lead to important considerations of a scientific character, which will be continued; others are of a more practical character. The atmosphere round the tower at this elevation is free from all influence of the soil, as would be the case at the top of a mountain, and the air is in an extraordinarily active state of electricity. The tower will, it is said, be the most perfect conductor of electricity during a storm, and all within it will be in a state of entire immunity against all danger from lightning. The electric beam from the Eiffel tower lantern has a luminous intensity of about 55,000 candles. Catadioptric rings are arranged to make the light stronger and stronger as it travels from the tower, so that in clear weather its range—if not limited by the earth's curvature—should be 127 miles, with an intensity of 5,000,000 candles.

The Electroscope.—The most astonishing claim yet made in behalf of electricity is that we can see distant persons and places by its aid. There is an apparatus called an electroscope which accomplishes this seemingly supernatural feat. A public test of this instrument before many scientific men showed a race course, 40 miles distant, plainly projected on a large disk of white burnished metal. Each detail stood out with perfect clearness, and even faces could be distinguished. Think of the possibilities of this invention! In the near future, friends separated by hundreds of miles may not only hear each other's voices by telephone, but also see each other's faces by the electroscope.—*Exchange.*

The Electric Welding Patent in Europe. It has been reported that the foreign electric welding patents were bought from Prof. Thomson for $750,000 by the syndicate, who sold them to the Thomson European Electric Welding Co. for $1,500,000. The stock, at 125, represents no cash in the company's treasury, simply the patents. The new addition of $100,000 is to be working capital. The company will do no manufacturing, but will sell rights to foreign countries.

New Fields.—Electricians are still finding new fields of employment for the subtle fluid. The latest is a new method of communication. By it a man can sit at his desk in New York, and the letter he writes with the electric pen is instantaneously reproduced in Boston, St. Louis, Chicago, or any point with which he wishes to communicate.—*Progressive Age.*

Passing Events.

The Bimetallic Congress was opened this week at Paris. There are 170 members present, including 23 representatives of European and other Governments. The president referred to the disastrous results that would follow if America should abolish the Bland Act and the Latin Union be denounced. Such action on the part of America, he said, would lead to a commercial catastrophe that would affect the whole civilized world.

A letter from the First Assistant Secretary of the Treasury to Salt Lake parties is to the effect that a duty will be collected of $30 per ton on all ores containing lead, either in argentiferous, copperous or gold ores; the value will have no longer anything to do with it. The circular will be explicit. It will state that ores of "lead mines," no matter how little lead they might contain, if the lead is saved by smelting or any other process, the importer of the ores must pay duty of $30 per ton. This ruling (if approved) gives to the miners of Utah, Idaho, Montana, Colorado, Nevada and Wyoming all that they have asked; it simply puts into effect the law.

The most severe storm in 50 years swept over the Atlantic Coast this week, destroying an immense amount of property on shore and wrecking a number of vessels.

The discovery of diamonds in Mexico, spoken of in the PRESS a few weeks since, seems to have been confirmed, if reports in the Mexican papers are authentic.

The Russian Rouble and Silver.

Several times reference has been made in these columns to the Russian rouble in connection with the silver market and its bearing on the market value of wheat. The rouble is the chief metallic currency of Russia, and, being a silver coin, its value in other countries is based on the price of the bullion, unless there is a political disturbance, when its market value is largely depreciated below that of silver. The rouble has such marked fluctuations in the money markets of Europe that it necessarily must be largely dealt in. A short review of the more decided changes will undoubtedly prove of interest at the present time.

Just before the Crimean war the quotation of the rouble in London was 3s. 2¾d. This war of course caused a fall in its market value, but subsequently there was a recovery. Just before the Russo-Turkish war the quotation was 2s. 9d. The disturbances in the Balkan peninsula and the conflict between Russia and Turkey caused another heavy fall; then followed a slight recovery and a certain degree of steadiness, which was afterward succeeded by a gradual settling in prices. The decline, with slight reactions, continued until well into last year, when the low price of less than 1s. 8d. was quoted in London. This shows a decline since 1852 of nearly 50 per cent. More than one-half of the decline can be attributed to the depreciation of silver; for, although specie payments are suspended in Russia, it is not to be left out of sight that the rouble is a silver coin. The remainder of the decline is due to the political condition and policy of Russia.

During the Russo-Turkish war the credit of Russia fell so low that she was unable to borrow abroad, and consequently one means of defraying the cost of the struggle was to issue a large quantity of notes. This necessarily had its effect on the rouble, which depreciated to such an extent that the Russian Government ordered repayment to the Imperial Bank of Russia of the extra issue of notes caused by the war, and their cancellation. Although the payments were made, yet there was no cancellation of notes. In fact, the financial difficulties of Russia have been so great ever since, and its credit so low, that it has been unable to meet its liabilities abroad except by the sale of roubles, which it adopted since the Russo-Turkish war. These forced sales have created quite an active trading in them in the European money centers, particularly in Berlin. The roubles are purchased at a depreciation and used in the payment for wheat, coal oil, and other articles of Russian exports. That large quantities of roubles are from time to time put on the European market can be readily seen when it is recollected that Russia has to provide in sterling for the payment of its debt held abroad, and it is also to be borne in mind that it has to make many large contracts in foreign countries for military purposes. It is not to be supposed that the military preparations that have been going on for several years past, and the vast concentration of troops that has been taking place in Poland and other military objective points, can have been accomplished without very large contracts having been placed abroad, and these contracts would have to be liquidated, in large part at least, in coin. The greater part of the Russian taxes, however, are received in paper money, and Russia consequently has not the means of meeting its engagements except by constant borrowing and therefore the selling of roubles to meet maturing obligations abroad.

The rouble, like India council bills, has a decided effect on the price of silver by curtailing the trade call for the bullion to meet, as stated above, purchases of wheat and other export commodities from Russia. By depreciating silver and thereby lessening the value of the rouble, Germany inflicts a serious financial loss on her feared enemy Russia, and consequently does no little in keeping the latter power in check.

ADMISSION DAY was celebrated in various parts of this State on Monday, the main event being the general meeting of the Native Sons of the Golden West at San Jose, where appropriate ceremonies were conducted.

IT is generally expected that Secretary Tracy will recommend to Congress an appropriation of about $500,000 for putting shipbuilding plants into the navy-yards.

Big Gold Bars.

An item has started the rounds of the press taken from the Montana papers that the largest gold bar ever made in the world has just been cast at the U. S. Assay office in Helena, Montana. The bullion came from three mines, the Spotted Horse, Drumlummon and Jay Gould. In shape it is a section of a pyramid, the base being 18x7½ inches high, and top surface 17x6 inches. Its weight is 6945 ounces or about 500 pounds avoirdupois. Its value is a trifle over $100,000. The bar was shipped to Minneapolis to be placed on exhibition at the exposition there. As soon as the exposition at Minneapolis is over, the bar will be reshipped to New York and placed on exhibition in that city. The display will consist of four bars of lead for a base of the monument, four bars of copper for a second course, four bars of silver for a third, and on top of the whole to rest the $100,000 gold bar, and the monument will be surrounded by specimens of quartz and ore from all parts of Montana.

This will be a first-rate monument of Montana's mineral resources, but the claim that the bar is the largest ever made is incorrect. One was made in this State in 1882 by the North Bloomfield Mining Co., worth $114,000.

The writer of these paragraphs had the pleasure of seeing that bar at the time. Its weight was 511½ pounds troy. The length was 15 inches, width six inches, and depth seven inches. It contained 630 cubic inches of gold, worth about $19 an ounce. The mold was cast at the Nevada City foundry from iron produced at Clipper Gap, in this State. The dimensions of the mold were: on top, 17 inches long and seven inches wide; on bottom, 16 inches long and six inches wide. It contained 715 20 100 cubic inches. The thickness was three-quarters of an inch on the sides and one inch on bottom.

It was in 1873, if we remember aright, that the Spring Valley Co., this State, sent down to this city a bar worth $41,000, which they thought was the largest ever made. At the request of the company we made inquiries and found one had been received here from Helena, M. T., worth an even $50,000, and several others worth $35,000, $41,000 and $40,000 had been made. The Spring Valley Co. (Cherokee Flat, Butte county, Cal.) then made a 35-day run with 1000 inches of water, and with a partial cleanup of 800 feet of head flume and 14 undercurrents, produced a bar worth $71,273, weighing 299 pounds. Then they shipped another worth $90,000.

The North Bloomfield hydraulic mine then made a run and turned out the biggest gold bar ever made, worth $114,000. This all came from one run of one mine, and, notwithstanding the recent Helena bar from three mines, still remains the largest ever made. There is a model of the bar in the museum of the State Mining Bureau in this city.

Connecting Mine Cars With Ropes.

Cuts on page 201 show several methods adopted for connecting ore cars with the wire ropes which move them through levels or on inclines. The first three figures show three devices which have been used with satisfaction when operating a "side entry," where it is customary to facilitate disconnection from the hauling cable by employing what are known as "knock-off" links. In the counter-rope system, where there are two engines, one in the mine and one out, alternately pulling a train of cars in and out by two ropes, the ropes are connected end to end by means of a chain, as shown in the fourth cut. The number of these connections varies according to the length of the train. The next cut below shows a shackle joint, which is frequently used in making connections between sections of rope in various wire-rope haulage systems. The sixth and lowest of the engravings illustrates the most approved designs of swivel-chain connection between the wire rope and cars on inclined planes.

THE statement of the Boston Montana Consolidated Copper and Silver Mining Co. for one year ending June 30th shows a mining profit of $1,014,917.

TIN IN NEW MEXICO.—It is stated that tin ore has been found at the mica mines near Tres Piedras station, in Rio Arriba county, N. M.

Pan Amalgamation.

(*Continued from page 201*)

usual manner. The pulp from the batteries is then conveyed in pipes to the special grinding pans, placed immediately below and in front of the batteries. In these pans all grinding of the pulp is done, the product of ten stamps passing through two in succession. From the grinding pans the pulp is discharged into the first amalgamating pan at the end of the line and then flows continuously through the line of pans and settlers, they all being connected together by pipes near the tops of their sides. The pans are charged with quicksilver by means of pipes leading from the distributing tank, and the amalgam is drawn off through pipes to the strainers. Here a quicksilver elevator lifts the strained quicksilver back to the distributing tank and all handling is thus avoided. Two chemical feeders working automatically supply the chemicals to the pans at such intervals as may be desired. From the last settler the tailings are run off or led over concentrators. The pans and settlers are all placed upon the same frame and on the same level and each is driven by means of gears brought into action by a friction clutch fitted to gear on the main line shaft. Each pan and settler being thus provided with a separate clutch, any pan or settler or any number of either can be stopped independently of the others in case of accident or for cleaning-out purposes. In order to secure the continuous flow of the pulp through the line when one or more pans or settlers are stopped, steam siphons are provided for carrying the pulp past them and cutting out for repairs or cleaning.

All the water from the batteries must pass through the pans so that all slimes are treated; there is less loss of quicksilver; a true sample of tailings may be taken, while by the old method this is impossible.

Generally speaking, it may be stated that any ore adapted to pan treatment can be more successfully and economically worked by the "continuous" system of pans than by others, in addition to the saving effected in any first cost of plant and subsequent maintenance.

A Remarkable Silver Mine.

The mine belonging to the Broken Hill Proprietary Co., Limited, on the Barrier Ranges silver-field, New South Wales, is a wonderful one. It is in charge of W. H. Patton, formerly of the Comstock. During the past six months there has been extracted from the mine 67,741 net tons of ore, yielding 2,677,686 ounces silver and 11,418 tons of lead, or an average of 17 per cent lead and 39.38 ounces of silver per ton of ore treated. This ore has been mined and put into the surface bins (including all deadwork) at an expense of £1 1s. 3d. per gross ton, and the cost of smelting, during the past six months, has been at the rate of £1 13s. 10d. per ton.

The total number of employes on and in the mine is 2127, a fact which in itself shows the magnitude of the operations. In the mine proper, not counting any others, there are 1416 men, and there are 354 connected with the smelting department. In general construction and repairs 337 are employed.

For the half year they smelted 68,545 tons of ore. In doing this they used 15,866 tons of limestone, 11,232 tons of coke. The amount of flue dust treated during the half year was 804 tons, containing 241 tons lead and 8040 ounces silver. Deducting this amount from the totals of the above table leaves 70,162 gross tons, equals 67,741 net tons of ore as the amount of ore actually treated.

The cost of smelting has been 33s. 10d. per ton. During the half-year, £240,000 has been distributed in dividends, paid monthly, being equal to 30s. per share of £2 each, and the directors expect to immediately announce a satisfactory increase in that direction. The amount of £40,862 1s. 5d. has been spent on construction account, and at the close of the half-year, after providing for all outstanding liabilities, there are surplus assets in cash, stores, and bullion on hand, representing a value of £100,431.

The total amount of dividends, bonuses, and additional shares allotted to shareholders since the formation of this company is £3,128,000.

The ore reserves have been added to this year, notwithstanding the draft of 67,000 tons extracted.

Construction of Maps in Relief.

The practical use to which topographical models or relief maps have been put has within the last few years taken a wider range. They are rapidly coming into favor for other than purely scientific purposes, and their value for illustration and instruction is being more fully appreciated. Topographical maps, representing by contour-curve lines the elevations and depressions of the earth's surface, are now demanded in engineering work of nearly every description, and afford a ready means of bringing out the configuration of the country in a simple manner.

By reason of the inability of unskilled persons to understand the nature of a topographical map, it is sometimes necessary to construct the same in relief, with the rivers, canals, railroads, etc., delineated upon it. With the aid of such a map, problems in engineering science, which would otherwise require expert assistance to explain them, are reduced to a simple and understandable form.

Relief maps are also of value to the geologist in working out the geological structure. To the instructor they present the most ready and efficient means for imparting clear and accurate knowledge of topography; and they are invaluable in courts of law. The best one of this kind in California is that at Prof. Davidson's office, which is a relief map of the Pacific Coast, showing the mountain ranges, lakes, rivers, bay and coast line. From this we have had made a large photo-facsimile chart on a reduced scale from the original.

There are various methods of construction, and a description of some of the forms employed may be interesting, especially to mining engineers and superintendents who may desire to make such maps of the country about certain mining properties. John H. and Edward B. Harden of Philadelphia have written a paper for the American Institute of Mining Engineers describing the construction of relief maps, from which we make the following extracts: A contour-line map, or one on which the elevations are marked at numerous points, is the first requisite in relief-map making.

One of the earliest methods of constructing these maps is that of drawing section lines across the topographical map (in intricate topography, also at right angles, as in Fig. 1) and transferring these lines to thin boards or metal strips; the hight, as shown at the point crossed by each contour, being measured from the base of the strips, and the profile thus obtained cut out. The position of these section lines is transferred from the map to a base-board, as a guide to adjust and fasten the profile strips.

Fig. 2 shows the topography of the map (Fig. 1) drawn on profile strips in one direction only. Fig. 3 represents the same and with profile strips also at right angles. The model of the squares so formed may be filled in with wood or plaster.

Another method is to make a tracing on cloth of the contour map, and this is laid on a block of plaster, and with a pointed instrument contours are transferred to the plaster before it has had time to dry thoroughly. Then begin at the lowest contour and cut the plaster down to the desired level, this being determined upon by means of a sliding scale for measuring vertical elements.

A method similar to that described by Prof. King was practiced by Prof. J. P. Lesley, at the University of Pennsylvania. Instead of using one solid block of plaster, a number of blocks of uniform size to cover the area of the map were taken, and a profile was drawn upon the sides of each block. They were then carved down to these lines, the space between the profiles being shaped by the eye.

One of the early models made in this country, that of the Morrison's Cove region, Blair county, Penn., was constructed by Prof. Lesley on this plan, the blocks being of wood, three inches wide, and was carved with woodcutters' tools. Fig. 4 is an illustration of what may be done by the block method of construction, the two blocks shown being taken from a large model of Blair county, Pa., made by one of the writers. The geological structure is shown in section on the sides of the blocks.

The method preferred by the Messrs. Harden, and the one that has given the most satisfactory results in their hands, both as regards accuracy and ease of manipulation, is that of cutting out the contours on wood of the proper thickness to represent the vertical interval selected, building up and finishing in wax.

Having a base-board one inch thick, with one planed surface, and the exact dimensions of the intended relief, either paper, card-board, strawboard, or wood of a proper thickness to represent the contour curves, is used to build up the model. Having at hand transfer paper, stylus, hammer, wire nails, glue and a jig-saw, you have all the material necessary to begin work. Suppose the scale of your map to be 1–19,200 of nature, or 1600 feet to the inch, and it is decided to build up the steps representing 50 feet vertically, then the material should be 1–32 of an inch thick. Lay your map upon the base-board and transfer to it the outline of the first 50-feet contour. Transfer the same outline to the material selected for the building up of your relief, and also the outline of the 100-feet contour as a guide for the position of the next layer. With the jig-saw cut to the outline of the 50-foot contour, then fasten it to the base-board with glue and nails in the position marked for it. Proceed in like manner to transfer the outline of the 100-feet contour, and make marks for the adjustment of the 150-feet layer; saw out the 100-feet line and nail it down.

Proceed in this way to the greatest elevation of the relief, always marking your material with two lines—one for cutting, the other for a guide for the position of the next layer above. Should the final layer, representing the tops of the hills, be less than 50 feet, it may be rubbed down with sandpaper to its proper hight. When this is complete the relief appears in terraces one-thirty-second of an inch in hight, each step representing 50 feet and corresponding in outline to the contours at 50, 100 and 150 feet, and so on to the highest elevation, as shown in the cardboard model, illustrated in Fig. 5.

If wood is used, each alternate layer should be laid down with the grain at right angles to the preceding layer, to counteract the contraction or expansion of the wood, which will otherwise seriously interfere with the accuracy of the result. It is also necessary to take precautions to prevent the pasteboard giving trouble from the same defect.

Should the model, after finishing, be cut along certain section-lines to exhibit the geological structure, these lines should be marked upon the map and transferred to each layer at the same time as the contour lines, and when nailed down care must be taken to keep the nails far enough away from these lines to allow the saw to pass.

The model is now ready for the waxing process. For this purpose the following formula is recommended:

Beeswax, 16 parts; Venice turpentine, four parts; cornstarch, eight parts; Venetian red, one part; sweet oil, one part.

Melt the wax, add the Venice turpentine, and sift in the cornstarch, stirring the mixture thoroughly, after which the Venetian red or other coloring matter may be added, together with the sweet oil. This preparation, poured into flat dishes, and allowed to cool, is used to fill up the angles or steps.

The skill of the topographer now comes into play in forming the finer details of the topography from the map, between the successive steps

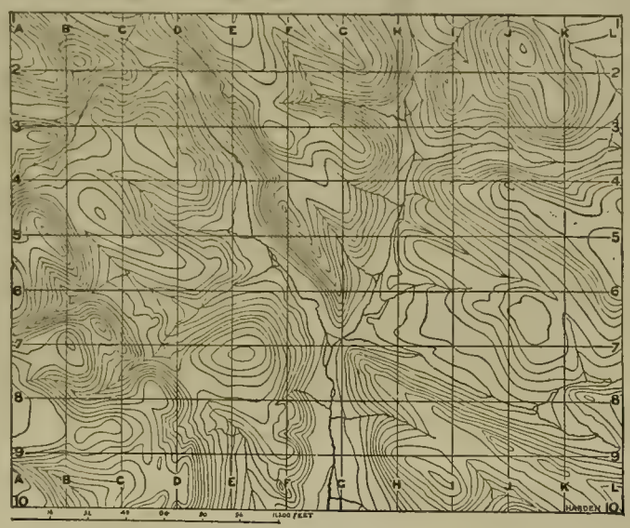

Fig. 1.—SOUTH MOUNTAINS, PA., FORM GEOLOGICAL SURVEY MAPS.

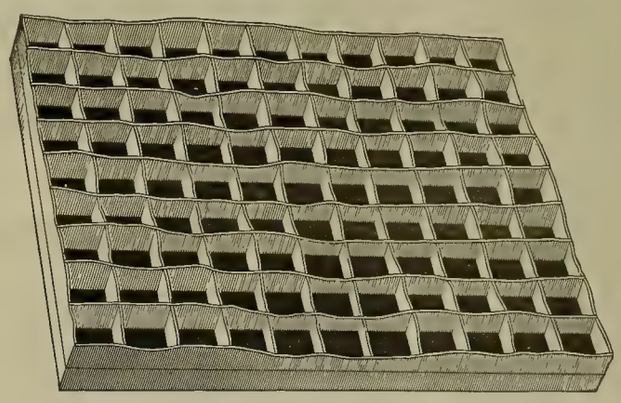

Fig. 3.—MODELING BY SECTIONS IN TWO DIRECTIONS.

Fig. 4.—WOODEN BLOCK MODEL OF GEOLOGICAL STRUCTURE.

Fig. 5.—MODEL MADE IN CARDBOARD.

formed by the boards, it being assumed that the orginal is in contours ten feet apart; and it is in this part of the work that the mere mechanic fails. The tools employed are of various rounded forms and sizes, to suit the intricate shapes of the finished model. They can be made of hard wood or bone. The wax should be of a consistency to work easily, which can be obtained by regulating the quantity of sweet oil in the above formula.

In some first attempts by one of the writers, a mixture of tallow and resin was used to cover the wood before applying the wax. In practice this was found unnecessary, the wax adhering to the wood without it. A little sweet oil used on the tools when giving the final touches, will be found advantageous.

If the above method of waxing is followed, the relief may be kept for years without danger of separation from the wood; or it may be finished for immediate use when time is an object. Usually, however, the wax relief is only used to cast a mold in plaster, from which any number of duplicates can be made. At this stage of the process help may be had from a plasterer, who will cast copies for a small sum, depending upon their size. When a modeler desires to make his own casts, it may be done in a manner which will be described in next week's PRESS.

A Rich Mineral Belt.

If any one capable of canvassing the matter, says the Homer *Mining Index*, will take the trouble to thoroughly examine the ground along the summit ridge of Prospect mountain, between Mill Creek canyon on the north and the old Dick Turpin ledge on the south, he cannot fail to conclude that this mineral belt is one of remarkable continuity in the production of free gold-quartz, as nearly "free" as any other district can show.

There is no chance for doubt or speculation about the great dimensions of the ore body in the channel that traverses the mountain from one end to the other unless we unwisely assume that metal-bearing rock abruptly disappears at the depth of 700 feet below the croppings, which is the deepest point to which the hill has been penetrated, and that in the May Lundy mine.

For a distance of nearly two miles the quartz seldom fails to afford a good prospect, whether taken directly from the ledges or pricked up as float. Throughout the system of north and south veins with which the mountain is ribbed, a barren ledge cannot be found, while in places along the croppings—and these not very far apart — the protruding quartz is thickly speckled with gold.

All the mines located on and along the ridge are, without exception, valuable properties, and should be producing gold in large quantities, instead of being in a stale and unprofitable condition. A comparatively small sum of money would put them on a paying basis. With the ground fairly opened for the extraction of ore and with facilities for transportation and reduction, the bullion would roll out with astonishing rapidity.

Outside of this particular belt which cuts the mountain in twain, there are many locations upon which more or less work has been done—enough, however, to prove that the gold is not all on the surface; that it goes down, and that the ledges become stronger, and also develop the characteristics peculiar to the May Lundy group of mines and those in that vicinity.

There are unequaled inducements for capital here, such as few mining districts can offer. As we have frequently said, there has been enough bullion extracted to develop bonanzas in a dozen or more places, but the short-sighted men into whose hands it falls do not care to spend money for the development of their properties, not having sufficient knowledge about systematic mining to realize that a mine, like a cow that is ever so good, may be "milked dry." When they find that dividends have shortened to a complete stoppage, they may possibly get the idea through their heads that the best mine in the world will not stand incessant gouging—that some "dead work" must be done, and new ground opened and explored, if they want their mines to yield more bullion. If they knew anything about their own business, they would be doing this now, under the direction of a competent miner. It would put lots of money in their pockets.

THE EARLIEST ELEVATOR.—Probably, according to the London *Globe*, a reference to the use of "lift" has been found in the Greville Memoirs, under date March, 1830. Greville describes one as being used in the Royal Palace at Genoa—"a machine made like a car, which is drawn up by a chain from the bottom to the top of the house." There is some curiosity as to whether there are any early references to a convenience which in England has only been supplied to any notable extent during the last few years.

THE NEW WHITE LEAD PROCESS.—The new Hannay method of manufacturing white lead from the ore in the space of a few hours is soon to bring about a surprising revolution in the business, as by the old process it takes several months to bring about results.

Influence of the Forests on Climate and Rainfall.

[Translated for the PRESS from the works of AUGUST GRISEBACH, with comments, by PROF. GRANVILLE F. FOSTER.]

The question of the effect which forests exercise on climate, and whether an increase in land cultivated, when it implies the clearing away of the wood and the letting in of the sunshine upon the soil formerly shaded by dense thickets of trees, does actually cause any essential change in the physical conditions of organic nature, is a very important one, and one frequently asked, and in a variety of senses as often answered. That the forests do exercise an influence in preserving the ground uniformly wet during the course of the seasons is universally acknowledged. The slightest observation is needed to establish this fact, since the hight of water in rivers flowing from forest regions changes less than in those which flow through open, unshaded landscapes. The humus of the soil about the trees, interwoven with roots and rootlets, retains a part of the rainfall which otherwise would have long before run off into the brooks or rivers. Also, the rainfall itself is more copious in such a region, since each leaf is an evaporating pane, and hence the mass of leaves of a forest forms an unexampled extent of surface, furnished with water, the constant evaporation of which causes a coldness which communicates itself to the surrounding stratum of atmosphere from which thus the dampness can again be condensed to fogs and clouds.

(This will be true if the atmosphere near the trees is near the dew-point; that is, already nearly saturated with moisture, but this cannot occur often in California, since at the season of leaf, the interior plain, shut off from the sea, except at a few points, becomes so hot that the relative humidity of the air is very low, the capacity of the air for moisture becoming greater and greater with the increasing temperature. Thus air at 100° Fahr. can hold in an invisible state five times more moisture than air at 50°, and hence, air which at the second named temperature would be exceedingly damp, would become excessively dry at 100°, and yet have the same amount of water in it. The fact, however, that moisture is retained at the roots of trees by both the condition of the soil and the shading by the leaves, is just as true of this State as for any region on the globe, and the necessity for preserving the forests of the Sierra Nevada mountains, the source of the streams which spread fertility everywhere in the valley, and from which the people of the State hope to get the water to carry out their schemes of universal irrigation in the future, is becoming more and more imperative. The last three years have been comparatively dry ones, and the snows of the mountains, unsheltered by trees, melted away early in each season, making the latter part of the dry season dry in fact, below as well as above, causing serious inconvenience everywhere. It is a shame for the State to allow unprincipled men to kill the goose which lays the golden egg.—Translator.)

The summer sky often becomes a topographical mirror of the landscape beneath. Over the forests the clouds are formed, but the sky is deep azure above the open and strongly heated plains out of which ascends a steady stream of hot air into which patches of the surrounding clouds are seen to enter only to vanish away. Were the cloud-masses not in constant motion, it would rain still more frequently in the forest, since the whole precipitation would be there, but the motion of the clouds and the succession of wooded and woodless tracts of country supply the favorable condition for supplying the latter with showers, since when the clouds are unusually heavy and the temperature somewhat lower than usual, the clouds will press over the whole of a given region, wooded or not, and a precipitation will take place even when the general direction of the wind betokens clear weather.

(The truth of this statement is often observable in the summer season in the wooded portions of the Sierra Nevada mountains, in which there will sometimes be heavy showers which will extend somewhat beyond the line of the forest, while the dry season is yet at its hight. It often rains on a few of the largest, densely wooded oases of the Great Sahara desert of Africa, although on all sides lie almost interminable stretches of sand and rock upon which rain never falls. Deserts perpetuate themselves. Is it well that California should be reduced to a desert by man's stupidity?—Translator.)

Three physical circumstances in combination can be alleged for the lower temperature which obtains in forest regions than elsewhere, and which, during the period of vegetation, fully accounts for the frequent precipitation of moisture. First, the vast mass of leaves which prevents the sun's rays from reaching and hence from warming those unorganized portions of the earth's surface beneath, capable of receiving a high degree of sensible heat, so that the stores of water laid up partly in the web of mingled humus and rootlets directly beneath the trunk, to which a large share of the total weight of the fullness of the vegetation of the tree is directly owing, and partly in the surface stratum of the earth in general, are in the main preserved, and finally the evaporation of water from the leaves which constantly exerts its cooling effect on the circumambient air. All of these account for the coolness of atmosphere which prevails in forest regions. The effects of these show themselves in the measurement of the temperature of the web of rootlets, and in comparing the temperature of the shaded earth with that of the landscape which stands in full open sunshine. In winter, opposite conditions obtain, so far as temperature is concerned, but what worked in summer for the acceleration of a water circulation through the atmosphere of the forest is of positive worth in increasing all the rainfalls of the year. In the high mountains the diminishing of the rainfall may not always be observed, even if the forests be cut down, since the effect of the trees may be less than that of the coldness of the ground, resulting from the great altitude; but in the highlands of the tropics, in India, and in Brazil, and in the lowlands everywhere, has the destruction of the forests been followed by a corresponding lessening of the rainfall.

(The climate of California being semi-tropical, the lower slopes of the Sierra Nevada, say to the altitude of 3000 feet, would come under the same rule as the slopes of the Himalaya to a hight of about 10,000 feet—that is to say, the removal of the forests would diminish the rainfall. But the removal of the forests from the slopes of the Sierras at a *greater* altitude than 3000 feet would also *work injury*, for though it might not diminish the aggregate fall of water, which here in winter usually assumes the form of snow, yet the very absence of the trees would allow the sun's heat in spring to melt the snow away rapidly, swelling the rivers for the time, only to leave their dry beds later on in the season, while the protection of the trees would preserve the snow so that it would gradually melt; and it would hardly be quite melted away before the next year's precipitation would commence.

The effect of cutting away ruthlessly the timber of mountain-sides may be seen in all its deplorable result in the land that once "flowed with milk and honey," most of which has been reduced to a treeless desert which will remain so till proper irrigation has been resorted to, trees again planted and forests thus formed to start again in all their beneficent results the former and the latter rains. We have in the industry of the Mormons a result which ought to be a good lesson to Californians. A desert has been made to blossom like the rose. The numerous artificial forests about Salt Lake City have caused considerable precipitation each year, which is on the increase—a fact shown from the increasing depth of Great Salt lake, which has already raised some 12 feet since Brigham Young led his faithful hosts to a barren waste, which cultivation afterward turned into a veritable Eden or Second Palestine.—Translator.)

The Fortune of Gold Digging.

As an illustration of the fortune of gold-digging, we publish the following from the *Australian Mining Standard;*

"The history of one of the Ballarat claims, called the Blacksmith's claim, because the owner belonged to that craft, reads like a page of romance. The blacksmith with a party of eight, all novices, sunk the shaft in so irregular and unworkmanlike a manner that it was absolutely at the risk of his own life that a man made the descent to the bottom. Without opening out a regular drive, they washed all the stuff within reach, and, after realizing £12,800, offered it for sale; but so wet and rotten was the ground, so badly sunk the shaft, that at first no purchaser could be found. At last a party of ten plucked up courage and bought all right and title to the claims and tools for £77. They entered into possession at noon on Saturday, and long before the sun had set had in their possession £2000 worth of gold. By working day and night until the following Monday they raised this to £10,000. Then, after the usual reckless manner of lucky diggers, they left this mine of wealth and went on the spree for a week. Their tenants made good use of this time at their disposal; they opened up two drives, and before the week was out were the happy possessors of £14,000—all taken out of the claim. The other party returned, and after a week's work, during which they realized £9000, sold out to a storekeeper for £100, who put in a gang to work in shares, and these, laboring in desultory fashion for a fortnight, took out £5000. At the end of that time one of the party, an old hand from Van Dieman's Land, undermined the props and next morning on returning to work the men found the whole of the workings had fallen in. The rest of the party appeared to have taken this misfortune very calmly, and to have completely abandoned the claim, for no mention is made of further proceedings. But it is related how the author of the mischief cooly marked out a claim of 24 feet square on the top of the ruin, and working with a hired party sunk a shaft straight as a die for the gutter. The tubful of washed dust they raised turned out 40lbs. of gold, and the next two averaged 10lbs. each; and, as Ballarat gold was, and is, superior to any other at all times, fetching at least £4 an ounce, these three bucketfuls of earth were worth £2880 to their fortunate possessor. Altogether out of that small area, hardly larger than a good-sized room, was taken in a few weeks gold worth nearly £60,000.

A Site for Manufacturing.

The Grass Valley *Miner* says: The approaching completion of the great granite dam over the American river, near Folsom, is beginning to engage much attention, as the ample water-power that will be obtained for the use of such manufacturing as will be conducted at the State prison, and by private corporations and individuals, gives an assurance that at no distant day Folsom will become a place of real manufacturing importance. Its location, supplemented by this water-power resource, warrants this assumption, for the power will be so much cheaper than the use of steam that manufacturing establishments will naturally gravitate to that point. The value of the power that could be furnished by the American river at Folsom has long been realized by observing men, but the time had never been ripe for carrying out the project of building the necessary works, and has now only reached the point of fruition through the assistance given by the State by the furnishing of convict labor, which has greatly cheapened the cost of the enterprise. The success of this great project admits of no doubt in the minds of practical men, who see in it the beginning of other enterprises of a similar character along the foothill range of the Sierras, where the mountain rivers make their entrance into the valley.

The next point that is worthy of particular attention is at the narrows of the Yuba, in the close vicinity of Smartsville, where a dam of the same character as the one at Folsom could be constructed at a much less cost. This location has long been regarded as a very favorable one for the construction of a debris-impounding dam, but without considering a dam for that use the facilities offered for a dam to secure water-power for manufacturing purposes are equally as good as at Folsom, and cannot long be overlooked by far-seeing and enterprising men. Smartsville would have the same advantage as a manufacturing center as Folsom if it had railroad communication, and this would certainly come if a dam were built and the canal constructed that would convey the water to the various establishments that would naturally grow up there. The Yuba basin is equally as large as that of the American river, having the drainage of a vast territory between Bear river and the Feather river basin, and extending from the valley to the highest ranges of the Sierras. Smartsville has a like advantage with Folsom in being centrally located at the edge of the valley, being about 700 feet above sea level, and possessing a salubrious climate, being below the snow belt, and an adjacent country susceptible of high cultivation on account of the quality of its soil, which will yield a great variety of products.

Smartsville, by natural situation, should become one of the important manufacturing points in the State, as it shares with Folsom the facilities for that purpose.

Horseback Prospecting.

Throughout all the mining regions, says the Bedrock *Democrat*, there has been done a great deal of horseback prospecting. Most of this was done by the old-timers. Ask one of these to day about the mineral characteristics of a particular section of hill or mountain country, and he will sententiously pronounce it "no good." If his reason for thinking the range in question "no good" be demanded, he will probably tell you that he and half a dozen "old pards" traveled all over the country years ago and "saw nothing worth stopping for."

Take half a dozen men, mount them and start them through the country, and it is not easy to get them to stop for anything. When an unusually large and fine-looking quartz vein is found they may dismount and look at it, but that number of men can never be brought to agree to stop and work anything. One or two may think the party should halt and sink upon a vein that presents a promising appearance, but the others will at once begin to make all manner of objections. There is no timber near it, it is too far from water, or the country rock is not of the right kind. Such a party generally has some particular mountain range or section of country for its objective point, and in going toward it there is no turning aside from the most direct and easiest road. Not a man will dismount and go up into rocky hills where a horse cannot be taken. Such a range of hills may be skirted, and some member of the party may point to spots to indicate the presence of mineral veins, but the others begin at once to point out features of a damaging character, and when all the arguments pro and con have been heard, the verdict of the mounted jury is, "no good."

In all the Pacific Coast States and Territories there are mountain regions embracing hundreds of square miles that have been "prospected" in just this way. How many expeditions we remember that they have started out well mounted and equipped with a sufficient number of pack animals to carry an ample supply of provisions through all long stretches of wilderness. One in particular from the Pacific Coast passed through the southeastern part of Oregon, thence into Idaho and down through Nevada into Colorada and Arizona, where they turned and journeyed back to the "place of beginning," as the surveyors say. In all this trip they never dug a hole five feet deep in either quartz vein or placer ground. They

could never agree upon any vein or spot of ground. They were after an immensely "big thing," and the big thing was always ahead. In Idaho, Nevada and Arizona they discovered a number of mineral belts and lodes that were afterward found to be rich—which yielded millions on millions in gold and silver and built up large towns and camps—yet when they got back to Tehama they reported that they had found nothing; the country over which they had passed was "no good."

THE NEW GERMAN METAL, known as germanium, is described as having a great resemblance to antimony, though distinguished by certain well marked reactions. It is found that if the sulphide is heated in the absence of air, that is, in a current of hydrogen, it forms a blackish crystalline sublimate, which, at a higher temperature, melts to brownish-red drops; this sulphide dissolves in ammonium hydrosulphide, and is again precipitated with a white color by hydrochloric acid, and is again redissolved by ammonia. If arsenic or antimony is present, the color is yellow; if heated in air, or treated with hot nitric acid, white germanium oxide is formed, which is not volatile at a red heat. The oxide dissolves in potassium hydroxide. If this solution is slightly acidified, it gives a white precipitate on treatment of hydrogen sulphide. The oxide is easily reduced by hydrogen, the sulphide less easily. The metal is gray, volatile at a full red heat, though less readily than antimony; the vapor deposits small crystals resembling those of iodine, which do not melt; in a current of chlorine the metal yields a white chloride, which is more volatile than antimony chloride. Such are some of the characteristics of this curious new metal.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap), do us the favor to write again.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or an other ore crushing machines now before the public.

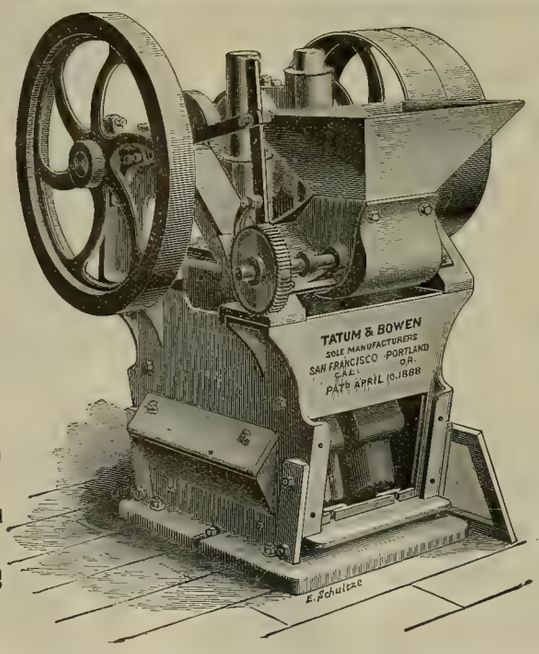
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.
GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco

THE LEATHER INDUSTRY.

The Tanning Business.

The tanning business of California is one of our most important manufactures. We are not only working up our own hides into leather and our leather into boots and shoes, harness, gloves, etc., but we are exporting large quantities of leather to be worked up in the East. California has the hides, the bark, the tanners, and a fair market for all the leather she can produce beyond that which is needed for our own consumption. The extent to which this interest has already grown makes a very respectable figure in the assets of the State and in the annual balance-sheet of our leading industries.

The Business Not Injurious to Health.

There are many in this city and other cities and large towns in the State who object to the presence of tanneries in their neighborhood on the plea that they are unhealthy. In regard to that matter the *Hide, Wool, and Leather Trade Review* of this city of a late date says: "Any man who argues that a tannery or anything connected with the business carried on in a well-conducted tannery is injurious to health, lays himself open to flat contradiction by all students of hygiene and compilers of vital statistics. The tables of life-insurance companies show that in the opinion of actuaries who have made a life study of the effect of the various occupations on longevity, the tannery business is not injurious to the health of those that follow it, and therefore cannot be to the inhabitants of the vicinity who are still further removed from its atmosphere. Obnoxious to the acute sense of some people, possibly, nay probably, tanneries are, however, well conducted. But there are a great many things obnoxious to some people which, nevertheless as members of the community, and for the benefit of the community at large, they must put up with. The ringing of church bells, the firing of salutes, the rumbling of the cables of the street railroads, the continual jingle of the bells of these cars, the cries of hawkers, the piano next door or the midnight ball over the way, are all nuisances to some people. Many consider a church close by a nuisance, and a public school a worse nuisance; a livery stable is a nuisance, a blacksmith shop, a steam engine, a foundry, a flour-mill, or a boilermaker's shop, these are all nuisances. A butcher's shop is not a pleasant neighbor because it attracts flies, and a down-town store where Limburger cheese is dealt in is worse. Yet all these nuisances are permitted and openly allowed, because it is for the interest of the many that they should be allowed even though a few may suffer." These opinions are fully sustained by our city Board of Health.

Tanning by Electricity.

A French firm (MM. Worms & Bale) have succeeded, after long endeavors, in applying electricity to the art of tanning in such a way as is claimed to accelerate the process. We are now able, says the *Electrician*, to give some further information as to the method adopted, and although our knowledge of the art does not enable us to offer any opinion as to the precise value of the invention, yet we are very hopeful that it will ultimately afford an important outlet for electrical apparatus. What is actually done is very simple. The rawhides are placed in large cylinders which revolve upon horizontal axles. Provision is made for passing a current through the drum, the electrolyte being a decoction of tannin. (Further electrical details are at present wanting.) The drum is kept slowly revolving until the process is complete. The time required varies with the nature of the hide. Light calfskins, sheep and goat skins, which used to require from four to six months, are said to be completely tanned in 24 hours. Horse and ox hides require from 72 to 96 hours, while by the old-fashioned bark process they would have taken 12 months or even more. As to the quality of the leather, several French leather merchants have stated that it is above the average strength and has all the solidity and suppleness of the best samples. Specimens of harness, etc., made from this leather are shown at the Paris Exhibition. Furthermore, in addition to the economic value of the immense saving of time, it is stated that the working cost per pound of dry leather will be only 3½ to 4 cents, as against 7 to 8 cents per pound, which is the figure now reckoned by the Bermondsey tanners. The number of hands required is said to be only about one-fifth, and the capital expenditure is largely reduced. It is evident that if only half this be true, there is, to say the least, "something in it."

As to the scientific aspect of the question, the exact nature of the role played by the electric current is not at all clear. Prof. S. P. Thompson, who has examined the process, suggests that the effect may be in some way to open the pores of the hides and so permit a more rapid access of the tanning solution, and also that its chemical activity may be increased by the electrolytic action. Mr. A. Zwierzchowski thinks that the current renders the gelatine more soluble, so that it is able to combine more rapidly with the tannin.

M. E. Leonardi, in a recent number of the *Revue Internationale de l'Electricite*, mentions several schemes of this nature, all of them failures, the earlier ones necessarily so, from the lack of an economical means of producing current, while others suffered equally from a lack of electrical knowledge on the part of the "inventors."

The *Shoe and Leather Review* reports the formation of a company with a capital of $800,000 in Chicago and New York for tanning by electricity, under a process said to be in successful operation in Sweden. It is claimed by the promoters of this enterprise that by the electric method leather can be made in four days, while the time usually consumed in this operation now averages five months.

A New Leather Preservative.

In this connection we would call attention to an alleged discovery which is said to have been made by some one connected with the State University at Berkeley. It seems that some three years ago some experiments in the chemical department at the University showed that certain combinations of fats and oils with certain sulphur compounds had the effect of rendering leather water-proof, very pliable and much more durable than under ordinary circumstances. Very little was said about it, but the severest tests were applied to the leather thus prepared in various ways when made up into boots, shoes, etc., and in every instance the new products showed most remarkable results. The leather wore from two to three times as long as the usual material. Some of our cotemporaries, both in this and in the Eastern States, seem to be much interested in the discovery. The leather manufacturers are becoming decidedly alarmed with the idea that if by the new process leather can be made to endure two or three times the wear of that prepared in the usual way, it will lead to a surplus of the article and a consequent reduction in the price. Large arrays of figures have been brought out. It is said that there are consumed in the United States alone $300,000,000 worth of boots and shoes a year. Now, if that value is ever doubled in its wear, it means a saving of nearly $150,000,000 a year and a consequent proportionate reduction in the call for the leather product. The result would be a revolution in the leather business disastrous to the capital now invested therein, but of incalculable value to the people who consume the product. Our entire population, from the youngest toddler to the oldest adult, are interested in the outcome, which will be looked for with much interest. If the expectations are realized, our University will have well repaid the people for their outlay in its establishment and become a matter of proud congratulation for all Californians.

Styles in Shoes.

In the battle of boots and shoes, the French seem to be losing their grip. The heels are coming down and the soles are spreading out. An observer in any city outside of Paris on a windy day will notice among the fashionable promenaders two common-sense shoes to one French heel, while a medium style, or a compromise between the two extremes, adorns the feet of the great majority. The *N. Y. Shoe and Leather Facts*, in alluding to this matter, says: On Fifth avenue and from Thirty-third street to Fiftieth, where the daughters of wealth and luxury most appear, the extreme type of common-sense shoe "takes the sidewalk" by a large majority.

It was about the middle of the last century that high heels began to be worn. Makers of heels were then introduced into the shoemaker's trade. Even now there are 400 heel-makers in Paris. Elastic-side boots began to come into use about 1842. The elastics were made in England. Boots and shoes were sewn up to the year 1800, then nails were introduced. In the ninth and tenth centuries the common form of shoe in Europe was the wooden shoe.

American Kid is Leading the World.

The Philadelphia correspondent of the *Shoe and Leather Review* says that there are now in that city two French kid leather manufacturers to learn the secret of the manufacture of American kid. French kid a a few years ago led the world, but now the French admit that when the kid is made up into a shoe the American kid looks as well as the French and wears better. The sequel of this is that the Frenchmen are here to learn how the Americans manufacture the article. This fact must be a consolation to our manufacturers who have persevered, amid discouragements, to perfect their beautiful products. So good a judge as H. D. Richardson of London thinks there ought to be a market for American kid in England, and who knows but it may be shipped to France? In view of this possible opening, it is a pity that our kid and kid-shoe manufacturers are not more fully represented at the Paris Exposition.

The Change from Boots to Shoes.

Considerable attention, says the *Boston Advertiser*, has of late been called to the calf-skin situation. Of late years the demand has been falling off, as other kinds of leather have been taking its place. One of the principal causes of this lies in the fact that long-legged boots have been going out of favor, shoes taking their place to a great extent. This has had great effect on the consumption of leather; upon an average it requires about two and a half to three times as much stock in the manufacture of boots as is required in the making of shoes. In this way the use of calf-skins has greatly declined. During the past few years the styles have run more toward "Dongola" and kangaroo leather for fine shoes, and this has been a serious setback for fine light-weight calf-skins.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING SEPT. 3, 1889.

410,307.—HARVESTER—Dan'l Best, San Leandro, Cal.

410,149.—RAILWAY RAIL JOINT—Chadbourne & Stuckey, Rosamond, Cal.

410,315.—GANG-EDGER—F. W. Cook, S. F.

410,349.—SAWMILL SET WORKS—F. W. Cook, S. F.

410,166.—MINERS' CANDLESTICK—D. B. James, S. F.

410,245.—BURNING BRICK—J. M. Jameson, Los Angeles, Cal.

410,252.—CUSPIDOR — P. I. Peirce, Oakland, Cal.

410,292.—CONCRETE-MIXER—E. L. Ransome, S. F.

410,334.—ROCK DRILL—E. A. Rix, S. F.

410,383.—PATTERNS AND MODELS—E. Stahl, Prescott, A. T.

410,301.—MERRY-GO-ROUND — W. C. Tyler, S. F.

The following brief list by telegraph, for Sept. 11th will appear more complete on receipt of mail advices:

California.—Eugene S Bonelli, S. F., exercising device for musicians; Joseph Brown, Santa Rosa, latch; Henry R. Coffey, Stockton, fare register; Wm P. Humphreys, S. F., assignor to C. Dodge, West Washington, D. C., dredging machine; Andrew W. Livingston and G. Wilcox, S. F., soldering machine; Edward Moyle, Grass Valley, drill chuck; Orestes Pierce, S. F., filter; Isaac F. Thompson, S. F., cut-off valve gear for engines; Hezekiah O. Triplett, Orland, grain separator.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GANG EDGER.—F. W. Cook, S. F., assignor of one-half to H. B. Gregory & Co. No. 410,315. Dated Sept. 3, 1889. This is an improvement in that class of wood-working machinery known as gang edgers. The patent covers certain constructions and combinations of devices.

SAW-MILL SET WORKS.—F. W. Cook, S. F. No. 410,349. Dated Sept. 3, 1889. This invention relates specially to the lever mechanism by which the set works are operated, and consists in certain novel mechanism for obtaining accurate fractional movements of the works. The object of the invention is to provide a simple and effective means for readily and accurately limiting and defining the movement of the set lever.

COMBINED HARVESTER AND THRASHER.—Daniel Best, San Leandro. No. 410,307. Dated Sept. 3, 1889. The invention relates to that class of harvesting implements known as combined harvesters and thrashers, and to the connection therewith of a traction engine, whereby the apparatus is drawn about the field, and a secondary engine by which the entire mechanism of the harvester and thrasher is driven independently. The patent covers certain details of construction and combinations of devices.

CONCRETE MIXING MACHINE. — Ernest L. Ransome, S. F. No. 410,292. Dated Sept 3, 1889. This is an improvement in that class of machines in which a rotating case is employed to receive and mix the material to form concrete, and is especially applicable to a machine patented by the same inventor July 14, 1885, in which a series of lifting shelves or flanges are fitted within the rotary casing of the mixer. The invention consists of an automatically operating device by which the shelves or flanges may be turned upon their pivot or fulcrum-pins, so as to either lie flat or stand, so as to discharge the material when properly mixed.

MERRY-GO ROUND.—Walker C. Tyler, S. F. No. 410,301. Dated Sept. 3, 1889. This invention relates to that class of holiday amusement devices commonly known as "merry-go-rounds," in which a rotating frame carries a series of seats in the form of carriages, boats, horses, etc. The operation of the device is such that a rocking motion is imparted to the horses, boats, etc., as they go about the circle.

ROCK DRILL.—Edward A. Rix, S. F. No. 410,334. Dated Sept. 3, 1889. This covers certain improvements in rock drills of that class in which the drill is connected with a piston moving in a cylinder under air pressure, and in which a valve mechanism is so arranged that the reciprocation of the piston and drill will be produced automatically. In the ordinary construction of the guides for the cylinders they have been made comparatively light and have been fixed in a horizontal plane above that in which the piston reciprocates, and as a consequence the rapid reciprocation and the jar of the piston in a different plane tended to destroy the accuracy and durability of the parts. By the construction devised by Mr. Rix the guides are so arranged that the line of travel of the drill and piston are brought into the same horizontal plane with the guides and directly between them, so that no undue strain takes place from the rapid motion or shocks of the drill. The guides are also given a larger surface, which causes them to run more smoothly and wear longer. Other improved details of construction are also covered by this patent.

Mining Personals.

F. M. Murphy is superintendent of the Congress mine, Arizona.

T. J. Quimby is superintendent of the Rawhide mine, Tuolumne county.

Geo. N. Conard is superintendent of the Little Boy mine, Todd basin, A. T.

A. P. Minear of the Amador G. M. Co. Limited, has left for the East on business connected with the mine.

S. L. Jones, superintendent of some of the Gold Hill mines, Virginia City, is visiting this city on official business.

O. H. Powers, formerly superintendent of the Cherokee mine, is in charge of the Lower Trinity Tunnel river-bed mine, Trinity Co.

F. S. Grant, a prominent mining man of Tuscon, A. T., was in the city this week; also, W. S. Davis, a mining engineer from Auburn.

John W. Mackay is expected to arrive at Virginia City the last of this week to personally inspect the mines in which he is largely interested.

Joseph Sparks, well known among the mining men of the Comstock for the last 20 years, has returned from a two-months' visit to the old country.

H. M. Levy, president of the Savage and Hale and Norcross mining companies, and Herman Zadig, returned to this city this week from a visit to the mines.

S. N. Knight of Sutter Creek has had photographs taken of his hydraulic engine recently described in the PRESS, and will send these to the State Fair, instead of the engine, which is too heavy to be sent down.

Prof. Wm. P. Blake, who is at Prescott, Arizona, says there is a deposit of kaolinite which should be utilized on Milk creek, one of the tributaries of the Hassayampa, entering just above the Walnut Grove storage reservoir.

Roger Pendergast, assistant superintendent of the Chollar, Potosi, and other Comstock mines, has been granted leave of absence, and will soon go to the Eastern States to visit his old home, which he has not seen for 33 years.

James L. Patterson, superintendent of the mine of J. S. Doe of San Francisco, was stopped between Daggett and Calico, and robbed of $5000 in gold coin. The money was taken by him from the express office the same morning to pay off the miners.

L. W. Pittman has been elected recorder of Cinnabar mining district, which includes territory in both Sonoma and Lake counties, in this State. Men have recently resumed work in this district, which has been idle for some years. In 1873 and 1874 several hundred men were at work in the quicksilver claims there.

C. C. Fitzgerald of the International smelter at El Paso, has bought the Turquoise mine, a lead property, at Tombstone, paying $30,000 therefor. This is the second lead property this smelter has bought since the agitation of the Mexican lead-ore question commenced, and it shows that an American can get lead in the United States for his smelter if he wants to.

Reward for Mail Robbers.

WASHINGTON, August 30.—The following order has been issued by the Postmaster-General:

In consequence of frequent armed attacks made by highway robbers upon the United States mails in the Western States and Territories for some time past, the Postoffice Department, for the year ending June 30, 1890, will pay the sum of $1000 as a reward for the arrest and conviction in the United States Courts of any person found guilty of making an armed attack upon any stage, coach or railway mail car having mails in transit. This reward will be paid to the person or persons causing such arrest and conviction, upon presentation of satisfactory proof thereof to this department. Order No. 139, of date July 16, 1889, offering $200 reward in like cases, is hereby rescinded.

NEW FERRY-BOAT.—The San Francisco & North Pacific Railroad Co. has filed for record two contracts for the construction of a ferry-boat, which is to be used in conjunction with those now plying the bay. One of the contracts is with John W. and James Dickie of the firm of Dickie Bros., to construct the hull of a double-end ferry-boat, in accordance with plans and specifications, for $45,250 The other is signed by Hinckley, Spiers & Hayes, who agree to construct the engine and boilers in accordance with the specifications for $79,000.

AT a meeting of the California University Regents this week, bids were received for the erection of a new building for a chemical laboratory at the University, and that of R. Mitchell, for $56,445, being the lowest bid which had complied with the regulations, was accepted.

THE steam fitters from various parts of the United States are in session in Chicago for the purpose of forming a protective combination, to be known as "The Master Steam and Hot-Water Fitters' Association."

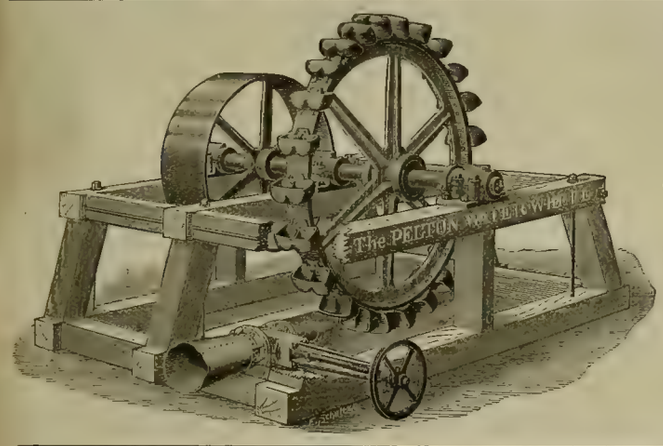
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.



Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 12, 1889.

In some branches of trade business is only fair, while in others it is fairly active. It is claimed that while trade is generally dull, the outlook is favorable for a large business this fall. The low price of grain is against a decided revival of trade in some sections, but the good prices for fruit, raw and dried, help in other localities. Farmers are generally storing their grain and obtaining accommodations. Large sums of money are being drawn from this city. One bank alone has sent out on an average about $50,000 in coin each day for the past three weeks. Two or three of the other banks are also sending out large sums of money. This money will soon begin to find its way back to this city. Outside of the call for coin, with which to move the grain crops, the demand for money is light, particularly with no speculative movements in anything.

MEXICAN DOLLARS—The market has ruled steady throughout the week at 74¾@74¾c. The steamer hence Sept. 11th for China took out for Hongkong $333,636; for Japan, $66,000. Total, $399,636.

Since writing the above, we are advised of a sale of Mexican dollars from first hands at 74¾c.

SILVER—The market continues to rule from one-fourth to three-fourths cts. an ounce above New York quotations, prices here being governed by the urgent requirements of buyers. For shipment by last steamer leaving for China, as high as 93 6-10c was paid; after the steamer sailed, buyers drew out and are only tempted by lower prices. We are unable to give correct quotations at this writing, and in its absence the quotations are nominally at buyers' bid, viz: 93⅛@93¼c an ounce. The obtainable supply on this coast is still light. The steamer that left yesterday for China took out the following bullion: For Hongkong, $119,000; for Japan, $149,300. Total, $268,300.

London cables came through to-day (Thursday) at 42 9-16d, with the market very strong. New York came through at 93c.

QUICKSILVER—Receipts the past week aggregated 309 flasks. The market is still quiet, with prices inclined to favor buyers.

LIME—Receipts the past week aggregate 5432 bbls., and exports by sea 750 bbls., to Honolulu. The market has a steadier tone, with the consumption showing an increase.

BORAX—Receipts the past week aggregate 182 ctls. The demand from the East is reported to be quite active, which causes a strong market.

COPPER—The market is unsettled, with lower prices ruling at the East. At this writing it is difficult to obtain reliable information as to the cause or causes that have brought it about, and in its absence it is only natural to ascribe it to the threats made some time ago that if the European holders and mine-owners did not come to American mine-owners' terms a strong fight and low prices would follow.

TIN—The exports by sea the past week aggregate 29,150 pounds plate and 3890 pounds pig to Victoria. The market has a steadier tone for spot and a strong tone for shipments. The demand with us is quiet.

COAL—Imports the past week aggregate as follows: From Nanaimo, 5506 tons; Port Blakely, 550; Seattle, 4310; Departure Bay, 6775; Australia, 2515; total, 19,646 tons. The market is very strong for both spot and shipment, yet there is an understone of uncertainty regarding the future owing to the large tonnage with coal on the way and loading in Australia for this port. The latest mail advices gave it at about 75,000 tons register, equal to about 120,000 tons of coal. Besides this is a registered tonnage of 12,000 tons for neighboring ports. The coast colleries are increasing their output, but then coast freight is higher. The home demand is good, as it always is when parties begin to lay in their winter supply.

IRON—Imports the past week consist of 200 tons of pig from Irondale. The local market is reported very strong at full figures. To fill a large order probably an advance would have to be paid. The high cost of iron abroad and higher charters make it nearly impossible to execute orders for forward shipment. The consumption with us is increasing.

The following are the latest comparative quotations f. o. b. at Glasgow:

Tuesday	42½	92⅜	10 75	4 05	21 75
Wednesday	42 9-16	93	10 75	4 00	21 50

NEW YORK, Sept. 9.—It is currently reported Lake copper sold at 11c; October and November, by responsible holders, electro grades, 10¾@11c; common casting, 9¾@10c. Pig lead advanced to $4 05@4.10, with strong consumptive demand, but at the close fell off again. The situation is also helped by the reduction of importation of lead in Mexican silver ores under the present Treasury Department regulations. Quicksilver steady; 69@70c. Borax strong, 9½c, refined.

IT is reported from Wales that extensive veins of gold quartz have been struck at Voel Vaman, Flintshire.

BOILER EXPLOSION.—A very disastrous boiler explosion occurred at the factory of the California Sash & Door Co., Oakland, on Tuesday, by which half a dozen men were killed and a number of others injured. The steel boiler which exploded was of Eastern manufacture, and had been in use about a year and a half. The safety valves were set at 85 pounds. A wire rope slipped off the pulleys just before the explosion and the engines were slowed down. During this time the steam ran up and the boiler exploded. About 250 men are thrown out of work.

ONE of the gas wells at Stockton is down 1250 feet. The deposit at that depth is a hard, close gravel that is much water-worn and belonged to an ocean bank or bed of a river. Some fine specimens of black oak petrifaction were brought up last week.

Mining Share Market.

On last Friday the bears made a raid on Mexican, sending the price down nearly 30 per cent, causing the balance of the market to fall off in sympathy. At the close a small rally set in which was followed by another raid the next day, from which it recovered under buying from chippers and a few others who had to meet their contracts. On Tuesday the market opened dull and easy, at lower prices, continuing weak and unsettled throughout the day. Under strong bear points there was free outside selling. At the close of the day a small rally set in, which was followed by a slight gain in prices yesterday (Wednesday) morning. On a report of an assessment levied on Best and Belcher, the price of that stock, Ophir, Mexican, and other North End stocks shaded off, but Yellow Jacket and the other Gold Hill stocks held strong, as if the pool were standing under them. In the afternoon board, the North Enders receded another point, but the Gold Hills advanced slightly under strong sustaining orders. The market, as stated last week, appears to be shaping itself for another upward turn, how much each person must be his own judge. There is no doubt but the pool has some cheap stocks to sell at a profit preparatory to levying assessments, and if the public take hold freely the move will be short-lived for the present, at least. The daily papers are just beginning to publish as news that given in the MINING AND SCIENTIFIC PRESS of Aug. 24th. In that issue of the PRESS additional news to that given by the daily papers regarding proposed work on the Comstock was given, which our contemporaries will soon give as original news. In the outside stocks the Tuscaroras made an upward move under the leadership of Commonwealth. The manipulators of these stocks are reported to have bought back at lower prices than they unloaded large blocks of the stocks, which, no doubt, they are preparing to let out again at a good profit. The Quijotoas and Bodies have been dull, weak and unattractive. Eureka Con. fell back without warning 50 per cent. For Silver King a quotation was not made at any time during the week.

One of the favorable signs of the times is the attention the New York papers are beginning to give to mining stocks.

Col. John W. Mackay is expected to arrive on the Comstock on next Saturday. It is said that after visiting the mines in which he is chiefly interested he will come to this city.

From the mines the news is mostly a repetition of last week's advices. The work going on in the Gold Hill and middle mines is of an important character. The connection in Con. Imperial of the 300-foot level with the old Con. Imperial shaft is very important, for it will admit of the starting of a west crosscut for the gold ledge lying to the west. The west drift in Yellow Jacket and the west crosscut in Challenge are being driven ahead as fast as possible so as to cut the gold ledge at an early day. The work going on in Crown Point and also in Alpha deserves careful watching. More extensive exploratory work will be inaugurated at an early day in all the mines running from Gould and Curry south. Active and important work is under way in the middle mines. From the mines lying north of Gould and Curry, no news of importance is at hand. Many experienced miners still have faith in an ore development in Mexican, as soon as they commence crosscutting to north drift from the west crosscut No. 1, in Mexican. From the Alta group nothing of interest is at hand. From the outside mines the same old stale reports come to hand, hardly worth the paper they are printed on, so far as giving any information to stockholders.

THE ACCIDENT AT GOLDEN.—Eleven men were buried alive by a cave on Monday at a coal mine near Golden, Colorado, and there is no hope of rescuing them. It appears that the miners were engaged in running a tunnel under Clear creek to strike a vein in the opposite bank. During the day they observed water dripping into the tunnel, but paid no attention to it. About 5 o'clock the engineer on the surface received a hurried signal to lower the cage, which he did. The cage went down part of the way and stopped. On being drawn up, he found it to be wet. A man then went down and found the lower half of the mine flooded with water, an investigation showing the old upper level of the mine had given way, letting the waters of the creek down the main shaft, instantly flooding the lower 400-foot level and drowning all the miners working there.

FROM a dispatch received from Tacoma, W. T., it is learned that there is strong probability of serious trouble at the Carbonado coal mines.

AN EARTHQUAKE startled the village of Florence, Wis., early Sunday morning, Sept. 8th. A rumbling was heard and a crack three inches wide made in the great dam across the Fox river, belonging to the Van Northwick Rogers pulp and paper mills. The sluice-gates were immediately opened to save the dam. The mill and machinery were damaged to the extent of several thousand dollars.

THE stampede to the Swauk gold district, 25 miles north of Ellensburg, W. T., is increasing. The lode, which produced from $100 to $700 nuggets, it is confidently believed, is at last found.

AN English gentleman, married, 48 years of age—M. A. Cambridge—one year in this State, desires employment in any position where a man of thorough integrity and business habits is required. The highest references given. Might change residence for a permanent position. Address M. A., office of this journal, or box 317, postoffice, Berkeley, Cal.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

For special reasons we here give prominence to the above notice. It has appeared in the above form in nearly all, if not every, issue of our journal for over one year past. Yet we are *occasionally* finding subscribers who say they have never seen the notice. Although they have received our paper constantly, or are knowing to its being mailed regularly to their address, they refuse to pay for it. Their excuses are various, viz.: "Never subscribed for it;" "subscribed only for the year paid for;" "told some agent to stop it;" "told the postmaster to stop it," etc. Through 24 years of careful and successful business, the proprietors of this journal have *never, knowingly or willfully, sent a newspaper to any person they knew at the time did not wish it, and we never will*, unless such person *unwarrantably* refuses to pay arrearages when able to do so.

No doubt we have been too obliging in retaining names once entered on our list of those whom we supposed desired to continue after the date paid for had passed. This, however, is owing to several reasons. Our paper is devoted to a cause that should entitle it, as long as devoted and true, to the friendship, goodwill and protection, if not the substantial support, of the individuals and classes whose welfare it sincerely strives to promote. The relations are such as should inspire mutual confidence and trust between publishers and subscribers.

While some are displeased to have a single copy of this paper sent beyond the time paid for, others are more lastingly offended at what they consider a breach of confidence, if the paper is stopped without their special order.

We shall be more careful than ever of sending this paper on credit in the future. Shall endeavor to employ none but *honest* and *careful* agents. Yet, if mistakes or discrepancies do occur, of any kind, we ask the favor of every subscriber to notify us promptly by LETTER (carefully stamped) or POSTAL CARD, with the full assurance herewith that we will not, knowingly, send the paper to any one who does not want it.

Those who report having written the publishers to stop their paper, before becoming angry about its not stopping, should remember it is far more likely that their letter never reached the publishers than that they would attempt to do business on so unsafe a plan as to continue to trust a subscriber whom they knew had written to stop it. In this connection we repeat the following points about stopping papers, some of which we know have been missed by very good and well-meaning and tolerably careful subscribers.

About Stopping this Paper.

In sending word to the publishers, you should be particular to note all of the following points: 1st, to send it to the P. O. by a trusty hand; 2d, to be sure you have a stamp on it; 3d, that it is correctly addressed; 4th, that your name is plainly written; 5th, that you give the name of your P. O.; 6th, that you give the name of the paper (or we should have to look over the long lists of subscribers on several newspapers). If your letter reaches us with the above 5th and 6th points overlooked, we should have to look over thousands of addresses to find your name to discontinue your paper. By missing one or more of the points above numerated on the part of subscribers, we are doubtless often blamed for not stopping papers when it is impossible for us to do so—and in many cases receive no intimation even about the matter.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

CARBON PAINT.

CARBON PAINT CO. TRADE CP MARK SAN FRANCISCO, CAL.

The most durable and effective Roof Paint in the world is now for the first time offered for sale in this market. A practical trial of it of over five years, in States and Territory where the right to manufacture it under our patent has been sold, demonstrates that for shingle or tin roofs, wood or iron bridges, undergronnd pipes, etc., it is the best and most durable paint yet discovered. It never cracks under any extremes of temperature, and it is guaranteed *never* to rust or corrode any metallic surface. As a protection against salt water it defies competition. Neither acid nor coal smoke affects Carbon Paint, and as it requires nearly a ree heat to destroy its protective qualities, it is peculiarly adapted for Fire Engines, Smokestacks, etc. Good, responsible Agents wanted throughout this coast. Liberal terms offered. Send for Circulars.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

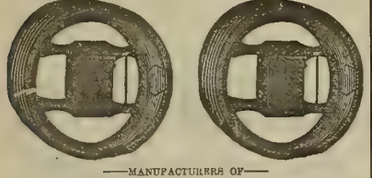
Anderson & Elias'

TEREDO-PROOF PILE CO.

HENRY ANDERSON, General Manager,

Is now prepared so furnish to wharf-builders, contractors and others, the

TEREDO-PROOF PILE COVERING.



Mr. Henry Anderson, the Inventor and General Manager, has just returned from the East, whe e he contracted with the Pittsburg Rustless Iron Works of Pittsburg, Pa., for Rustless Steel, prepared by them for the Company according to the Boyer-Barff process. Thirty tons of this steel are now on the way.

OFFICE, 132 MARKET STREET,

—IMPORTERS OF—

Munson's Leather Belting, Goodell & Waters' Woodworking Tools, Hill's Clutch Pulleys and Couplings, Emerson's Saws, Emery Wheels, Tool and Knife Grinders, Ewart's Link Belting, L. & D. Wood Pulleys, Hoisting and Pile Driving Engines, Etc.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR

LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

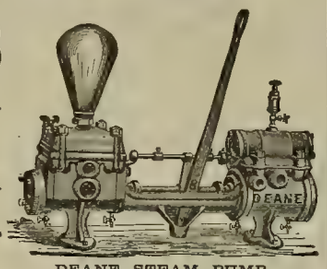
ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.



Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

DEANE STEAM PUMP.

Agents and Manufacturers of the Lieweilyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS

A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

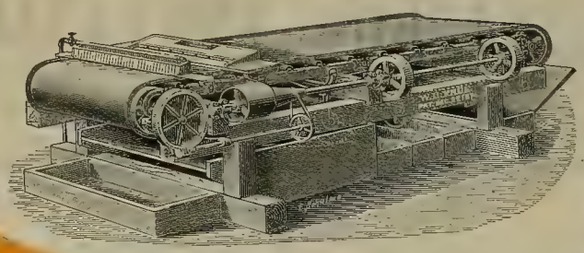
Smelter For Sale or Exchange.



One 50 ton wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further informati... apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

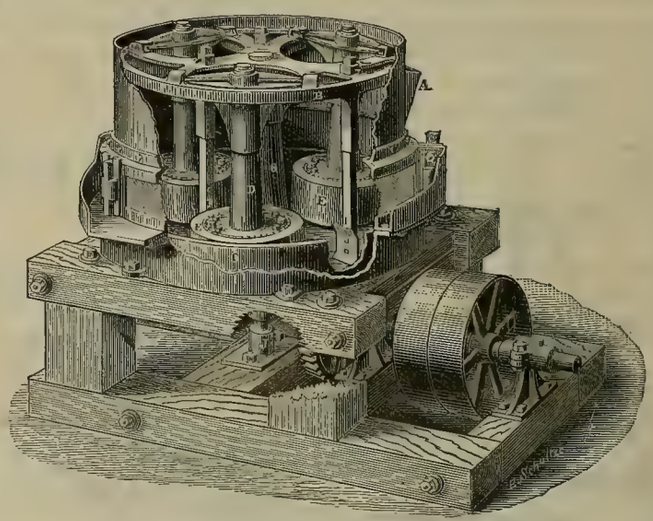
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 213 FIRST STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

PACIFIC IRON WORKS

1850. 1888.

—BUILDERS OF—

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

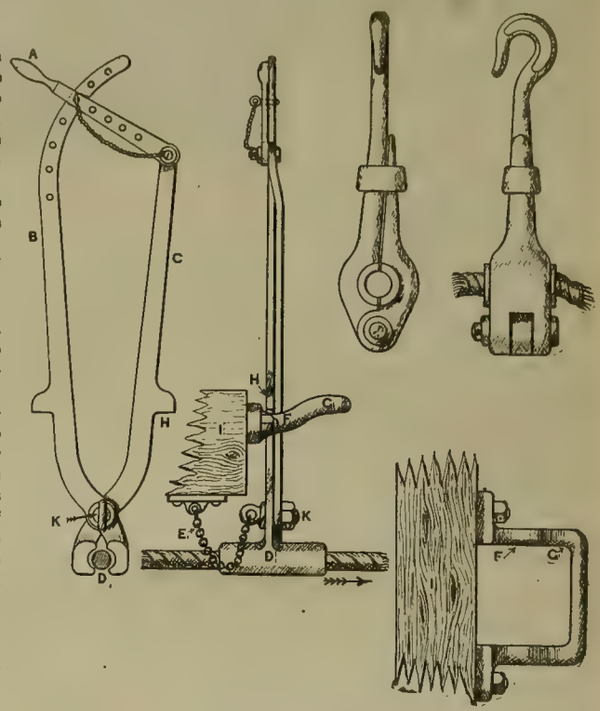
Three Dollars per Annum,
Single Copies, 10 Cts.



PRENTISS FRICTION SHAPER.

Prentiss Friction Shaper.

The stroke of the Prentiss friction shaper, shown on this page, can be readily changed while in motion to any length from ¼-inch to its full extent, by simply shifting the tapets or dogs, similar to those on a common planer. There are two different speeds for cutting either steel or the softer metals. The return stroke is 40 per cent quicker than the cutting stroke. It is driven by means of two belts, one open and the other closed. The grip is produced by two leather surfaces brought together in such a manner as to cause the grip to tighten in proportion to the resistance of the work. The machine is, therefore, able to take an exceptionally strong cut, in fact, all the driving-belt can pull without danger of slipping. The friction feed does not consume any power when not feeding. The Parke & Lacy Co. of this city have recently taken the agency of these machines, which are made in three sizes, planing in width from 16 to 22 inches, and hight, 18 inches.

Attaching Mine Cars to Ropes.

Much time and ingenuity have been employed in devising convenient grips for attaching cars to the moving rope in underground haulage, but those which have been found the most serviceable in mining operations are of the simplest character and among the first employed. On this page illustrated a grip which may be employed when it is desirable to start and stop the cars without interrupting the motion of the rope. Two levers *B* and *C*, acting on a pivot *K*, with jaws *D* for gripping the rope, are actuated by the link *A*. In order that the grip may pass over the supporting rollers, it is necessary that the rope, when gripped, be elevated above the rollers. To this end, the *U*-strap *FG* is attached to the bumper of the car, and the grip levers *B* and *C* are provided with lugs *H*. A chain *E* forms the link between the grip and the car, by means of which motion is transmitted to the car. In the illustration *I* the grip is in its lowest position, about to seize the rope. The operator, standing on the bumper at the front of the car, now presses the lever *A* and closes the jaws *D*. The rope, moving in the direction of the arrow, carries the grip with it until the chain *E* is taut. By this horizontal motion of the grip, the lugs *H*, resting and moving on *F*, are raised to the level of *G*, and the grip and rope are likewise elevated.

GRIPS FOR MINE CARS.

Where starting is performed at stated points, the following device may be employed: A grip similar to the foregoing is fixed by a bolt, *K*, to the bumper of the car. The jaws are about one and a half inches above the level of the rope when resting on the supporting rollers.

In many mines it has been found more convenient to adopt such arrangements that the rope is stopped for attaching and detaching. For this purpose the device shown in the upper right-hand figures of the cuts is recommended by Mr. F. C. Roberts of Philadelphia, from whose paper on "Wire Rope Haulage and Its Application to Mining" we take these notes.

VIEW OF CORINTO HARBOR, NICARAGUA

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Sights and Experiences in Paris.

EDITORS PRESS:—I learned before I came to France that the farmers had no division fences, but could not fully comprehend it until I saw that it was so. In coming from Bolougne to Paris I hardly saw a division among the farmers by fence. I do not know how they mark their lines. I do not know how they raise their cattle and horses. I occasionally saw their cows tied to a stake with ropes, but that would not do where they are raising any considerable number of stock. They have a few hedges, and they are mostly to mark large divisions, public, or railroads.

With all the wine and beer-drinking, and it seems universal in this city, I have not seen but a few persons under its influence any more than to make them very strong talkers. Every afternoon thousands of persons of both sexes may be seen sitting in saloons and on the adjacent sidewalks around little iron tables drinking wine and beer, and chatting as though they had just won a fortune, or were expecting to very soon. Country and city people go to the Exposition and take their little picnic baskets made especially and tastefully for the occasion, in which is one or two bottles of wine, glasses, napkins, a case-knife and bread. They sit down in little groups on benches, or on the grass, and make a business of it as though it was one of their important meals, and you will see the smallest of children indulging in wine in their mothers' laps. To show you that wine is the national beverage, and they only use water to wash the streets, irrigate land, and play their numerous fountains, I will say that I only saw drinking cups at two hydrants in their vast grounds in the Exposition, nor do you see them anywhere on the streets.

While on the subject of drinking, I presume bread eating will naturally follow. Bread is the real staff of life in France. I think no one but regular bakers make it, and they are very numerous. They do not put their artistic style in its manufacture as they do in other things, for I cannot recall but about three patterns of loaves. One is hot rolls, and we have them for breakfast (American breakfast, not French; 8 o'clock instead of 12 o'clock), and a loaf about one foot long by four inches thick, and a loaf in length according to the purchaser's purse and carrying capacity. It is a common thing to see bread three and four feet long, and about the size of a man's arm; but when I saw the champion loaf the other morning from my window, I thought I would order a few of them sent to some of my short friends in California. A woman of ordinary hight was carrying a loaf of bread in military or perpendicular style, and just held the lower end from touching the sidewalk, and may hops be not (over) 50 cents a pound this fall if the top of that loaf was not one foot above her head.

Living is considerably cheap considering the attractions this year. Most everybody lives at restaurants. We always have taken breakfast at the hotel, and now we take breakfast and dinner. We tried the restaurant a few times, but did not like it at all. They are too slow for the Yankee, and it was difficult to make them understand our order, also in making change. They take a little black coffee and bite of bread in their rooms in the morning, and some of them while in bed, breakfast at 12, and dinner at 6 or 7 o'clock in the evening. They will sit and sup and talk for hours over a radish one and a half inches long, one sardine, a little soup, a regulation loaf of bread, a little wine and a good deal of French atmosphere.

We order what we like and have it brought to a little dining-room adjoining our bed-rooms. We take turns in giving orders and usually try and surprise the rest until it is on the table. One of the most annoying things is the tip or service to the stranger. The waiters in the Exposition have stated that they had to give to the proprietor every morning before going to work, six francs. After paying for your wine or lunch you are expected to fee or tip the waiter from ten to five cents, according to size of the party. The American coming here and not knowing this custom gets into a Babylon of talk, and the Frenchman puts him down as penurious and mean. Going into a barber-shop for a shave, who knows whether the man that shaves you is the proprietor or hired? I give him a piece large enough to cover all demands and he returns change. If he is proprietor, shall I still tip him?

A French Bath.

I took a bath the other evening and laid down ample means, as I supposed, to cover all expenses. I was shown the room and there were no towels or soap. I succeeded in making the men know that something more than water alone was necessary for a good bath. When I came out the Frenchman was at the door, and jabbered something not comprehended by me. As I had learned, money was a great reconciler of all passions and desires. I handed out some pennies as a test, when he said, no—no—no. I motioned for him to follow me out to the old woman at the office. They talked it over. I threw down more coppers and the Frenchman got more excited than ever. I raked in the coppers and threw down two francs. The old lady made change and took out 12 cents. I thought then I could depart in peace. Not so; the cry still came for more. For a moment I absolved myself and laid up on a shelf my early Christian or Sabbath-school training. I never felt more like owning and controlling an establishment than I did that. There was no fault about the price. Twice I laid down enough money to cover all expenses. It appears they charge for the room and water, then for towels and soap, and then a tip for the waiter. Great big finely-dressed men will hold out their hands for a tip if you neglect them. It seems very humiliating to a person not accustomed to such a fashion.

I like to pay my full bill at one time, and get a clean receipt, and be entitled to the freedom of the boat, cars, hotel, or nation. Some of the cabmen expect a tip. About the only men who do not get tips are the men who receive our tickets at the gate, and the car conductors. When you get out of a cab that has a door to it, a man or boy will run up and open it and want a tip.

How the French Treat Horses.

Every Percheron horse sent over to the States should raise a prayer for deliverance out of the hands of these heartless Frenchmen. They are cruel task-masters to the defenseless animals, and there is not a moment in the day but what I can hear the loud cracking of their long lashes, sounding more like the explosion of a firecracker. They use long curb bits, with chain under the jaw, on every horse regardless of necessity. On one of the cabs I saw his register was 12,744, so that will give a faint idea of the number of horses employed in this city. They use three horses abreast on nearly every bus and frequently three on the cars, and there are thousands of them, to say nothing of the private teams, carts and wine trucks.

Hauling Wine.

A wine truck is a curiosity to me, and I will tell you how a Frenchman moves his wine in casks. He has a pair of heavy wheels about five feet high with a strong iron axletree. He uses two timbers 4x8 and 25 or 30 feet long. These are placed on springs, about three feet apart, across the axletree. The heavy shafts are fastened on the outside to the forward end of these timbers by a rod, forming a joint or swivel, so the rear end of the truck car fall to the ground, at the will of the teamster to receive a load of casks, while the forward end cannot go down only on a line with the shafts. On the forward end is a windlass with stationary levers eight feet long for tightening the rope around the casks.

At the rear and outside of these timbers are large pins, with knobs fastened every three feet for a distance of ten feet. These knobs are to assist in bringing up the rope immediately close to the last cask to be fastened or lashed on. When there is no load or partial load, the driver has a chair that he places in front and mounts. Under the axletree there is a swinging-box, say one foot deep by five square, where small things are carried. At the rear of the axletree, at right angles with the timbers (and under them) is fastened a chest with lock for wine, lunch, etc. Not content with having eight and ten casks on top, he will frequently sling three and four empty casks under the truck between wheels and horse. One horse usually moves this load, and it presents a comical sight to the stranger.

Items.

There are no telegraph-poles in sight. All the wires pass in tubes under the sidewalk.

The sidewalk is not obstructed by hydrants. Water-pipes are under the sidewalk and access is gained by raising little iron doors or gratings. Streams of clear water are seen running down the gutters, while men and women with brush-brooms are sweeping the dust into these streams to be carried into the Seine.

Clothes washing is done by men and women on the Seine on long floating barges. A small fee is charged for use of hot water.

One of the curiosities in mechanics in this city was a folding hand-cart. Grocerymen and fruit-venders have small hand-carts for the distribution of their merchandise. I suppose for the want of space in this busy city some genius has devised a cart that he could close up like a jack-knife and store away in a narrow space.

Admission tickets to the Exposition are sold on the streets everywhere and by everybody. If they are purchased at the office they cost one franc, and it takes two francs for admission before 10 A. M., and one franc after that time. At two different times I bought six tickets for two francs—40 cents. The usual price on the streets is half a franc, or ten cents. If I understand it correctly, tickets are issued for so many francs, say 25, with 25 coupons attacked. The purchaser of tickets can use the coupons or cut them off and sell them for what he pleases. A coupon is a ticket of admittance. This ticket has a chance in some indefinite, to me, lottery, and will be redeemed in 50 years. Tickets of admission seem too cheap. On the 14th of July, Bastile Day, 300,000 were admitted, and a few days after 114,000.

Paris. DANIEL FLINT.

THE ELEPHANT'S TRUNK.—The elephant has more muscles in its trunk than any other creature possesses in its entire body, their number being, according to Cuvier, no less than 40,000, while the whole of a man's muscles only number 527. The proboscis or trunk of the elephant, which contains this vast quantity of small muscles, variously interlaced, is extremely flexible, endowed with the most exquisite sensibility and the utmost diversity of motion.

San Francisco to Alaska.

[Written for the PRESS by GRACE STEWART.]

At 7 o'clock on the afternoon of June 8th, we were sitting in a Southern Pacific Railroad Pullman watching the lights of San Francisco and Oakland fast disappearing. Two nights and one day's travel brought us to Portland, where we changed cars to the Northern Pacific railroad, and at night reached Tacoma, W. T.

Although we nearly suffocated from the dust and intense heat, we enjoyed the scenery very much. The snow-clad summit of Mt. Shasta, which is 14,440 feet above sea level, looms up like an immense castle on a desert land. For many miles we followed a silvery, pebbled-bottom stream, which rises from the base of Mt. Shasta, crossing and recrossing it at least 20 times. Who would think this was the source of the dirty waters of the Sacramento river? Crossing the Siskiyou mountains, going into Rogue river valley, the railroad is like the trails of the Yosemite; at one time four parallel roads can be seen. After leaving Portland, for over two hours we are on the banks of that beautiful sheet of water—the Columbia river.

Although 70 miles from Mt. Tacoma, it is even a more beautiful peak than Mt. Shasta; it rises more abruptly, and is four feet higher, while the snow reaches nearly to its base. We pass farmhouses, orchards, small cattle ranges, through forest after forest, and leave many sawmills behind.

We boarded the steamer Ancon at dusk, June 11th, and at 4 o'clock in the morning the boat left Tacoma; we then felt that we were certainly on our way to the wonderlands of Alaska. In three hours we landed at the poor, burnt town of Seattle; the business portion, freight-houses and many homes, covering over 100 acres, was entirely swept away by the raging flames. Many of the merchants were moving into tents. A small restaurant was still flourishing, although nothing but the floor had been rebuilt; the cook stove and brick chimney were all that remained of the once large building. On a white canvas cloth, stretched between two charred telegraph poles, were these words in large flaming letters, "The New Delmonico." "We Still Live and Let Live."

Leaving there at 11 o'clock, we reached Port Townsend at three in the afternoon, where we remained 36 hours, taking on all kinds of merchandise, fruit, mining machinery, lumber and brick; over 50 crates of tin cans and 600 sacks of salt were going to the different salmon canneries. We went ashore and walked all over the town, which did not take very long; after climbing a flight of stairs of 123 steps, we obtained a fine view of the bay and surrounding country. Mt. Baker was a prominent snow-capped peak.

All the freight from San Francisco going to Alaska came to this port on the Walla Walla, and had to be reloaded.

Victoria.

A four-hours' sail brought us to the wharf within two miles of the beautiful city of Victoria, B. C. We stopped long enough to take a two-hours' ride about the city. The streets are all well paved; the drives and boulevards are numberless; tall shade trees shut out the sun and make it a place of rest and enjoyment. Ferns, or fine breaks, cover the ground on each side of the road, some being as high as five feet; these and a great quantity of delicate wild roses, the bushes much higher than a person's head, add much to the beauty of those country drives. Victoria has a population of 1200, and is about 40 years old, but has no street-car lines of any kind. The stores and postoffice do not open until 9 or 10 o'clock, and all usually close at four in the afternoon. We saw Chinamen—of which there are a great many—laying brick, mixing mortar, and working at all trades. The flowers were gorgeous in every yard, especially the roses and honeysuckle.

The Inland Passage.

After leaving Victoria we go through Plumpers, pass into the Gulf of Georgia; the boat winds its way between the islands until one cannot tell where we are coming out. These islands are very productive; Mayne island produces several tons of strawberries yearly. At Departure bay, two miles from the mining town to Nanaimo, we had a pleasant walk up in the woods. One hundred and fifty tons of Wellington coal was taken on board. From the head of Puget Sound to the mouth of the Chilcat river, over a thousand miles of inland sea, the ship is continually winding between and around the numerous islands covered with fir trees to the water's edge and delicate green ferns peeping out between them, lofty peaks holding their snowy caps, and the drifting clouds form a beautiful background to Nature's landscape gardening. It is like an immense park with a beautiful smooth sheet of water instead of cement boulevards. Where the strong current of the pale-green waters of the Fraser river rushes in upon the salt water, it is very noticeable. We saw several spouting whales, many porpoise and now and then a shark. On leaving Vancouver's island, we enter Discovery Pass; the tides rushing in and out of the straits of Georgia dash through the rocky gorge of Seymour Narrows at the rate of eight miles an hour; boats can only pass through in flood tide, and even then the water boils and rushes at a great rate and ships are turned out of their course by the strong and rushing currents. At other times the wind whistles through these narrows, and the water rises and falls 13 feet, although there are from 20 to 60 fathoms of water; there is a dangerous ledge of rocks in the middle of the pass on which there are only 2¼ fathoms. Only two ships have been lost passing through here, each a "man of war."

From Queen Charlotte sound to Calvert island there are 40 miles of open sea; a strong wind was blowing, causing heavy swells which drove nearly all the ladies and many of the gentlemen to their staterooms. As we again sailed among islands of indescribable beauty, the people gradually crawled out from their rooms looking paler than a few hours before.

About 4 o'clock in the afternoon the picture which lay before us was the same as described by Miss Scidmore:

"The clear, soft light, the pure air, and the stillness of the sky, and shore, and water, made it seem like the dawn of creation in some new paradise. The breath of the sea and the breath of the pine forests were blended in the air, and the silence and calm added to the inspiration of the surroundings. The eastern wall of the channel lay in pure shadow, the forest slopes were deep unbroken waves of green, with a narrow base-line of sandstone washed snowy white, and beneath that every tree and twig lay reflected in the still mirror of waters of a deeper, purer and softer green than the emerald. The marks of the spring avalanches were white scars on the face of the mountains, and the course of preceding landslides showed in the paler green of the ferns, bushes, and the dense growth of young trees that quickly cover these places. Cliffs of the color and boldness of the Yosemite walls shone in the sunlight on the opposite side, and wherever there were snowbanks on the summits, or lakes in the hollows and amphitheaters back of the mountain ridge, foaming white cataracts tumbled down the sheer walls into the green sea water."

On these islands and the main land are wild animals of many kinds. It was in this picturesque spot that we met the steamer George W. Elder making her way back to Tacoma. The long, sharp shriek of the whistle was reverberated many times. The captain, knowing that the people on board would be glad to communicate with each other, allowed the ships to go so near together that a person could step from one to the other. All the newspapers on the Ancon were quickly and eagerly read by some Seattle passengers who had been so long in the seemingly outside world and had not heard of the destruction of their city. All were eager to know what kind of a trip the Elder had; one lady remarked that there had been only one sunshiny day and that it rained *eight* days out of a week up in Alaska.

(To be Continued.)

Wonders of Nature.

Prehistoric Footprints at Carson.

EDITORS PRESS:—In a very short term at the penitentiary at Carson your correspondent saw many things to show that we are indeed a puny race compared with the men of old. A great sandstone quarry seems to have grown up on what was originally a clay deposit surrounding an old lake or pond. As plain as though made last week are the tracks of a mammoth. Careful measurement shows them to have been *twenty-one* inches in diameter. What a prize for Barnum! Why, Jumbo was a baby compared with these. Some German scientists thought that these tracks might possibly have been artificial work, as many of the convicts had exposed for sale things that showed marvelous ingenuity and patience. So the wardens of the prison blasted still farther into the quarry and exposed two or three new tracks while these doubting Thomases were looking on. At this the last trace of incredulity disappeared. The scribe did wish that some of his friends who have made so much sport of his number elevens could have seen how small they looked when standing in the moccasin tracks made by a man whose foot measured 23 inches. From this and the length of stride, it is calculated that he must have been at least *nine feet high*. Sullivan may knock out the men of his day, but how could he have met that fellow? Probably he would have had no conscientious scruples against entering the prize-ring, for up at Reno we saw a short piece of human thigh-bone not less than twice as large as that of an ordinary man, and with it part of a skull wonderfully developed behind the ears, but totally lacking above the eyes. If phrenology teaches anything, that man fought before he prayed.

His horse must have had a sorry time, being so much smaller than the man, for his tracks look very like those of the mustang that seems likely to become an extinct race so soon. In passing let us drop a tear to the memory of the horse that could go the most miles on the least feed of any that ever walked. We don't know where he came from or where he went to, but the giraffe left his tracks there. Shall we suppose that he formed part of the retinue of a Barnum or Van Amburgh in the days before the flood?

Birds were quite plenty in those days, and many of them larger than the bronze turkeys that strut so proudly at our fairs. Either wolves or dogs were there in numbers, and many clams and shellfish found homes and graves there. Farther up the rocks comes a layer of something strongly resembling slickens. I wonder how they panned out, and whether the owners of this sand-rock served any injunc-

PICKING GRAPES AND CURING RAISINS IN A RIVERSIDE VINEYARD.

tions, and how they stood on the debris question.

How the Mountains Have Been Hewn Down.

About four miles west from the prison, with the city of Carson midway between, is another wonder quite different. A cloud burst up in the Sierras a year ago, and down came a stream of water, bringing with it rocks, dirt and gravel enough to cover up the nice little ranch of Mr. Gifford, in some places 20 feet deep. We saw rocks there that he estimated would weigh 70 tons. Certainly they were very large rocks, whether they weighed all those tons or not. Mrs. Gifford was rescued from a sick-bed while the storm was coming that left much of this debris about the house, but the bulk of it in the field south. Mr. Gifford says that hardly anything in that line would surprise him any more, not even if a whole mountain should suddenly slide into the valley. F. S. C.

Amador County Mines.

EDITORS PRESS:—Throughout Amador, quartz mining is in a most flourishing condition. True, the old Plymouth has closed down, though that is but one of many and the many are pounding right along each day, but serving to show that the county's mineral wealth has scarcely been touched. Those who take in the State Fair will be given an opportunity in Amador's mineral exhibit of seeing the character of her ores and the exceeding richness of some of the same. The ores of the county are largely free-milling, carrying an average of 1½ per cent of sulphurets of an average value of $100 a ton.

The Amador reduction works at Sutter Creek treat all of the sulphurets of this and El Dorado counties, besides a large amount from other sections. Their works are the most complete in the State. Fifteen years of trial has given them the confidence of the miners; their terms are $20 a ton, 92 per cent of the assay value being given.

Each year sees new developments on the veins parallelling the mother lode, and many others in other portions of the county. With the exception of the Plymouth, there has been no time in the history of the quartz mining when the county has made so general and satisfactory a showing as at the present time.

E. H. SCHAEFFLE.

How to Save the Trout.

EDITORS PRESS:—Your correspondent in a personal interview with the superintendent of the Fish Commission, J. G. Woodbury, learned that the commission has no law empowering it to correct such destruction as is going on about Prattville, but that the County Government law passed last winter places the remedy in the hands of the supervisors. As different counties require different regulations for protection of game fish, it was thought best to place the matter in the hands of the supervisors to enact the necessary laws.

Commissioner Woodbury says people have no conception of the wholesale destruction that is going on. Much of it is caused needlessly and without excuse by the very parties who are all the time petitioning to have their streams stocked with fish. Miners, millmen and farmers are to blame; but farmers most of all. They use no screens at the head of their irrigating ditches, and so fairly manure their orchards, vineyards and meadows with young fish by the millions. Miners when hydraulicking would run them through their nozzles and beat them into pulp against the rocks just as though they were good to wash down hills with. Millmen dump their sawdust into the stream even when those who have tried it claim it is less trouble and more economical to have a furnace and burn it, as they do at Glenbrook, than to run it into the lake or bay, where it will always be in the way.

A Simple Remedy

Is to put a wire screen wherever irrigating or mining water is taken out, and to burn the sawdust instead of running it into the stream. Fish screens should be of galvanized wire cloth not larger than one-fourth-inch mesh. Such can be purchased in San Francisco at six cents per square foot. FRANK S. CHAPIN.

Big Meadows, Plumas Co.

Existing Laws.

Existing laws certainly cover some of the points made by our correspondent. The Fish Commission can require fish ladders to be provided by all owners of dams in streams frequented by migratory fish, and it is a misdemeanor not to keep such ladders in good condition.

The dumping of sawdust in streams is provided for by a new section of the Code which went into effect the first day of the present month. This we learn from a copy just received of "The Fish and Game Laws of California" (fourth edition), compiled by S. P. Maslin of Sacramento, and published by the State printer. It is an excellent piece of work and should be widely distributed. The new law concerning polluting streams is as follows:

Every person who places or allows to pass into any of the waters of this State any lime, gas, tar, cocculus indicus, sawdust, or any substance deleterious to fish, is guilty of a misdemeanor. And every person who uses any poisonous or explosive substances for the purpose of taking or destroying fish is guilty of a misdemeanor. Any person who shall catch, take, or carry away any trout or other fish from any stream, pond, or reservoir, belonging to any person or corporation, without the consent of the owner thereof, which stream, pond, or reservoir has been stocked with fish by hatching therein eggs or spawn, or by placing the same therein, is guilty of a misdemeanor.—[Approved March 4, 1889. In effect Sept. 1, 1889.]

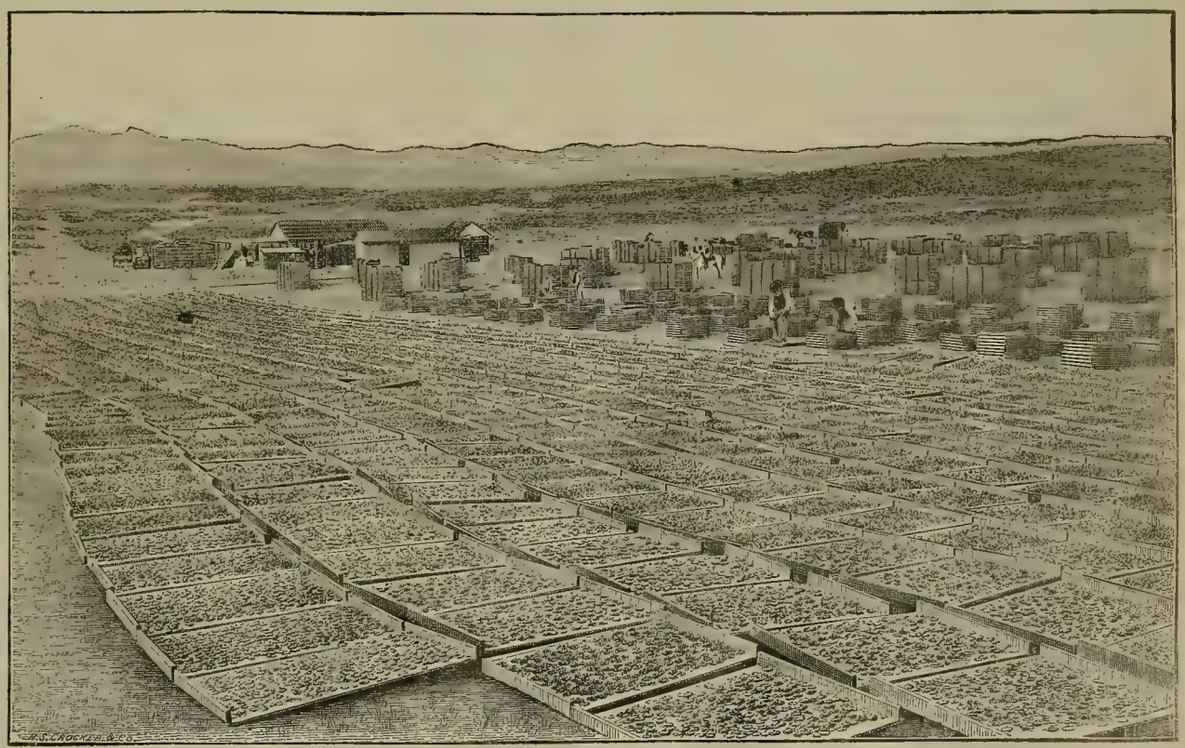
IT is said that before the construction of the Eiffel tower began 40 draughtsmen worked nearly a year on its plans.

SAN DIEGO has 50 miles of sewer that cost the tax-payers $500,000.

Raisin-Making in California.

As we are now in the hight of the raisin harvest, nothing could be more timely than views illustrating some features of this important work. These we reproduce from a handsome publication recently issued by the Riverside Board of Trade, and though they directly portray methods in vogue in the Riverside district, they are also illustrative of the general practice of the raisin producers of California.

Nearly all California raisins are cured upon small, light board platforms, which are called "trays." Wickson's book on California Fruits says:



There is great variation in the size of the trays. The common small tray is made of onehalf inch sugar pine lumber, two feet wide and three long—the boards forming it being held together by nailing to a cleat on each end (1 by 1¼ inches) and a lath or narrow piece of half-inch stuff is nailed over the ends of the boards, thus stiffening the tray and aiding to prevent warping. This is the standard raisin tray and was first used for raisins by the late G. G. Briggs.

Raisin trays are sometimes made of larger size, and instead of sugar pine redwood is occasionally used. Paper trays are also somewhat employed, and various other materials have been utilized.

The two chief methods of exposure to the sun are to place the trays near the vines whence the grapes have been gathered or to clear away a large drying floor and place the trays side by side upon this open space. This drying floor is used both for tree fruits and for raisins. Our illustrations show both these methods in vogue at Riverside.

The manufacture of raisins in this State is a progressive business, and each year the producers are introducing new devices and new methods of manipulation. To readers distant from the raisin vineyards the pictures we use this week will give a good general idea of the way raisins are made.

MALODOROUS SMOKE.—At a school in Sioux City, Iowa, recently, a fur cap belonging to one of the pupils fell into a bucket of hot ashes in a closet, and clouds of malodorous smoke appeared. The teacher seized the bucket and started for the door, but was overcome by the smoke and dropped into the nearest seat almost unconscious. A boy then took the bucket, but at once succumbed and fell to the floor. Twenty of the pupils who sat where the smoke reached them were made deathly sick and were unable to rise alone. By a superhuman effort the teacher managed to get the door open, and the fresh air revived her so she helped the children outdoors, where they lay on the ground in agony. The people living near by brought fresh milk and made the children drink freely of it. At the end of three hours all had recovered sufficiently to be taken home. It is supposed there was poison in the coloring matter of the cap.

DR. JARVIS' DRYING GROUNDS FOR APRICOTS AND RAISINS, AT RIVERSIDE, CAL.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador *Ledger*, Sept. 14: A telegram was received from Valentine in San Francisco last week giving instructions to tear down the hoisting works at the Mahoney and move them a distance down the hill, where they intend to sink a new shaft and start operations thereon immediately. This news is hailed with much satisfaction.

PLYMOUTH CON.—Beyond keeping the water out, nothing is going on at the Plymouth Consolidated. The report that the hoisting works have been sold to the owners of the New London is generally discredited, and also the rumor that a portion of the Pacific mill is to be torn down and taken to the Mulatos mine in Mexico, owned by Hayward and Hobart. All these rumors have a depressing effect upon the stock, which has now fallen to between $2 and $3 per share. That the mine will be restored to its old-time prosperity is not warranted from present indications. It looks as though Hayward and Hobart were preparing to transfer their attention from Amador to other mining fields. Carpenters were put to work building the New London mill this week. It will be pushed to completion with all possible speed. A line of five-inch pipe has been laid from Amador canal to the mill to supply battery water. The South Spring Hill Co. is putting in a separate water-pipe to the hoisting works for the purpose of operating a saw and other machinery. The rich ore which has been struck in the Gover has awakened quite an interest in mining in that vicinity. The ore has been struck in the 120 and 250 foot levels running north, and about 70 feet from the line of the North Gover. Specimens of the quartz have been sent to the State Fair.

CLOSED DOWN.—The Bunker Hill mill was brought to a standstill Monday morning, and nearly all the miners as well as the mill hands were discharged. Eight or ten men are kept at prospecting, and this is all that is going on at present in connection with this mine. The stoppage of the mill is ascribed to lack of water, but whether this is the only reason we are unable to say. The prospects of the property have not been bright of late, and the curtailment of expenses in every possible way has been deemed imperative. One great disadvantage has been that the ore has had to be run 700 or 800 feet underground. A new shaft away north of the present works is thought to be indispensable to place the mine on a good working basis.

Calaveras.

UNION COPPER.—Cor. Calaveras *Prospect*, Sept. 14: The new leaching and smelting works are nearing completion rapidly, and will be in operation in a short time. There are about 8000 tons of ore on the dumps ready for firing. Grading is about completed for the large smelting works, which, when completed, will reduce 100 tons of ore per day. The shaft which was damaged by a cave some time ago has been cleared and retimbered with 12x12 timbers; also planked with 2-inch plank, thus making a first-class job. Both shafts have been repaired in the same manner. New hoisting machinery has been erected on shaft No. 1, and Mr. Ferson has had two large safety ore skips made with all the latest improvements. It is the intention of the company to sink shaft No. 1 down to the same level as shaft No. 2, and then connect the two shafts at the 7th and 8th levels. The ore from shaft No. 1 is to be conveyed to shaft No. 2, where it will be dumped on to a large grizzly. The coarser rock will be crushed in a Dodge improved rock-breaker or crusher. Mr. Ferson found that the old Brodie rock-breaker would not do the work, and a 15-inch Dodge improved breaker was put in its place. The rock will be sorted here and the poorer quality will go to the leaching floors, and the highest grade ore to the smelter. At present the ore is conveyed from the upper ore-bins to the lower bins, where there is an 18-inch rock-breaker. The track is made of T rail placed on a strong and substantial trestlework a distance of over 2000 feet, over which horses haul large cars filled with ore. The company intend in a short time to put on a small locomotive to do the work of the horses, when about 400 tons of ore will be handled and worked per day. Over the present roasting floors are three lines of trestlework, each track being 413 feet in length. These floors are being covered up at the rate of from 150 to 175 tons per day. The grading for the leaching floors is completed. The grading for the roasting floors for smelting ore is almost completed, and from 3000 to 4000 tons of ore can be roasted at once. The plant has been so constructed that the ore will not be shoveled by hand after it is sent into the chutes in the mine. The location could not be bettered, as everything after leaving the mine goes downhill. The work is being pushed ahead as rapidly as possible under the able management of Supt. J. A. Ferson.

RICH STRIKE.—*Prospect*, Sept. 14: Bracket and Hutchinson, two prospectors, discovered a good prospect in quartz last fall near the Mokelumne river, about one mile from Mokelumne Hill. They worked it for some time and took out some money. They bonded the mine for six months to a man by the name of Reed, who ran a tunnel into a hill, and not finding anything, let the bond run out without accomplishing anything. Hutchinson and Bracket went into the Reed tunnel a few days ago, and within one foot of where Reed quit work, the owners of the mine struck a rich pocket and took out over $400 in one day, and there is plenty more in sight. They have without a doubt got a rich prospect, and their mine when developed may prove one of the best in the county. They have a fine location.

El Dorado.

BEN FRANKLIN.—Georgetown *Gazette*, Sept. 12: Col. G. W. Dent continues to deepen the shaft on the Ben Franklin, with two men at the windlass and one at the bottom. The shaft is down about 70 feet, and two hours' work every morning keeps out the water. The ledge is now 3½ feet in width, having improved both in quantity and quality. The ore is all of a good milling grade. The colonel is well pleased with his prospects for a good mine.

Inyo.

SPLENDID PROSPECTS.—*Index*, Sept. 11: About 20 years ago considerable tunneling and like prospecting work was done on the Drummer Boy mine, a location a short distance above the present site of Independence Depot. Ore transportation and other expenses were then high; the mine was abandoned and has since been untouched. Last year it was relocated by Nathan Rhine, who recently employed men to do the required assessment work. They have struck a promising body of ore, two assay returns from which assure a net return of $37 per ton. The ore averages about 40 per cent lead, and carries 40 ounces of silver with a trace of gold. The Inyo mountains have much hidden ore of high grade, some to be found through abandoned prospects and more to be uncovered by new discoveries. There are hundreds of miles of mineral territory in this county awaiting to reward the prospectors who shall give it their attention.

CERRO GORDO. — Archie Farrington, superintendent of the new Union Con. Mining Co., passed down the road on Monday. He had four expert miners with him, and informed us that present work at the mines would be much in the nature of prospecting. While the dumps and the old workings show more than enough to justify the price paid for the property, it is confidently expected that further exploration will develop new and extensive ore bodies, and result in working the mines on a large scale. So long as the labor is preliminary in character, only a limited force will be employed.

A DISCOVERY.—Last week Mr. W. C. Morton, while prospecting on the northeast side of Telescope peak, discovered several ledges of what appears to be rich silver rock. He states that there are three large natural tanks, which the elements have worn in the rocks, full of pure cold water, and that a stream carrying over 150 inches of water gushes down the canyon a few hundred feet from his discovery. Plenty of timber close at hand, and the ledges can be reached from Death valley, four or five miles east, by wagon.

WHITE HILL ORE.—Barnes & Kehoe have taken five or six tons of gold ore from their Red Top mine, and are now arranging for its shipment and working. No assays of the ore have been made, but frequent horn-spoon prospects indicate its high grade.

Monterey.

THE LOS BURROS MINE.—Salinas *Index*, Sept. 12: The Cruikshanks have sold their Last Chance mine in Los Burros to a company of San Francisco capitalists. The directors of the company are L. Gilson, president; Thos. Bell, Horace Hill, Robert Hamilton (of Baker & Hamilton) and C. W. Jackson. It is expected that the new ten-stamp mill will be ready to crush ore in about 30 days.

Nevada.

THE OLDEST WORKING MINE.—*Tidings*, Sept. 13: The oldest working mine in Grass Valley district, the Empire, is down 1850 feet and the depth is being added to at the rate of 40 feet monthly. Sinking will be continued steadily until the mine is 2000 feet in depth, when Supt. Starr declares that the ledge, now split, will be found united and as rich as in the palmiest days. Three times previously has the ledge split, and each time the main ledge has for a period thereafter been comparatively barren, while the upper and lower ledges, comparative stringers, have been rich. Such is the case at present, the stringers being worth $50 and $60 a ton but entailing too much expense for profitable extraction. Heretofore, development work not having been kept up in the prosperous days, the mine has been closed down. Even at present, it is admitted, development work is considerably behind, but with the facts mentioned above in mind, operations are steadily continued with almost a full force of men. The stringers mentioned are now obviously coming toward the main ledge, and, as stated above, the superintendent is confident of again striking it rich at the 2000 level. Further, he declares unreservedly that the Empire will be working 15 years hence, as will also the North Star. In the future, however, development work will keep pace with other operations.

WHY MINES ARE CLOSED DOWN.—"Many of our mines," said Mr. Starr in conversation lately, "have been shut down because while taking out rich rock here, development operations have been suspended in other quarters of the mine to enable the payment of good dividends. As a matter of course, the rich vein does not continue rich throughout, and then it is necessary to levy assessments to carry on deadwork that should never have ceased, and for which say $2000 set aside monthly would have been sufficient. Had this been done heretofore, the Empire, North Star, Omaha and undoubtedly a dozen other mines would never have suspended operations until the claims were worked out. That this is a fact is evident, for have not the mines named been reopened after the lapse of years, from $10,000 to $50,000 spent in developments and the mines proven profitable properties?" The Empire gives employment to 150 men—on day's pay, tribute and contracts.

A PROFITABLE MINING INVESTMENT.—A gentleman who knows whereof he speaks tells us that the Idaho mine pays a profit of $10,000 per stamp annually. When the Maryland, adjoining and into which the Idaho ledge pitches, is opened up, it will have a 60-stamp mill, and at the same ratio will pay 20 per cent on an investment of $3,000,000. The Maryland will undoubtedly prove a second Idaho.

A SIDE SCHEME.—That portion of the Empire mine known as the Rush & Laton ground has been let on tribute to James Oliver and others. There is a shaft 90 feet in depth on the ground and the tributers' lease includes the ore to a depth of 300 feet, below which the Empire Co. will conduct operations.

GOLD POINT MINE.—Grass Valley *Union*, Sept. 13: A crushing of 48 loads of quartz from the Gold Point mine has just been made at the Crown Point mill, and given a result that is quite satisfactory to the company, the yield being $20 per load of 3000 pounds. This was retorted gold from the batteries and plates, and did not include any from the sulphurets. The quartz opened in the mine looks equally as well, and other crushings equally as good are expected to follow. The ledge that is being opened up is from two to four feet in size, and the ground is favorable for working. In sinking below the tunnel level the water has been found quick, which will necessitate the use of a pump for further sinking, but the drifting and stoping on the tunnel level can be prosecuted without interruption, and the work of taking out ore will be kept up regularly.

CROWN POINT.—Grass Valley *Union*, Sept. 13: The Crown Point mine having been bonded to Jos. Bonivert, he has taken measures to incorporate a company for the development of the property, and on Tuesday evening there was a meeting of the subscribers of the stock for the purpose of organization. The name adopted for the company was the Crown Point Mining and Milling Co. Amount of capital stock, $660,000. The new company has nine months in which to complete the purchase of the mine, the price being $66,000. Some improvements are to be made in the hoisting and pumping machinery, a Pelton wheel being substituted for the large water-wheel now used. When this is done the 300-foot level of the mine, which has been flooded with water for 18 months or more, will be pumped out, and the shaft sunk for another level.

CHEROKEE MINING DISTRICT. — *Transcript*, Sept. 11: W. H. Hicks of Cherokee says the quartz-mining prospects of that part of the county continue to be very encouraging, and in his opinion a reasonable outlay of labor and capital there would result in opening up some valuable properties. The Lucky Joe is being opened up with a force of four men, and the Seneca is in a fair way to have work pushed on it again in the near future. L. D. Rathburn has brought to Locklin's mill at this city from J. G. Hall's Uncle Sam claim in the same locality two tons of fine-looking ore taken from a superficial depth. A ton taken from the same mine some time ago milled $71. The question now is as to whether the ledges of that district improve or fail as they descend.

NORTH STAR.—*Transcript*, Sept. 13: The total output of the North Star quartz mine of Grass Valley for the month of July was $21,219.44, and for August, $27,400. Nearly all the levels have contributed to this output, but the most has come from the 1800-foot level. The ore extracted during the last two weeks of August averaged $20 a ton. The 1900 level is now being opened. The company will pay a $50,000 dividend shortly.

THE SPANISH MINE.—The last load of the milling output recently purchased from C. W. Cross' mine, near Camptonville, for the Spanish mine at this city, will be brought down during the present week. The shaft at the mine is being put in fine condition and next Monday Frank Miller will commence the work of putting up the mill. The Spanish is being developed entirely by local capital, and it has every promise of proving a valuable claim.

Placer.

PICK AND SHOVEL.—Placer *Herald*, Sept. 14: The Live Oak Company is sinking a shaft on the west rim. The Mammoth Bar mine is making its owners rich. A. Shurtleff is taking out very rich rock at the St. Patrick. The Hogsback Co. expects to start the new tunnel right away. The Red Point is paying big. The Mayflower mine still rolls out big dividends. The tunnel at the Gray Eagle mine is now in about 130 feet. The rock is very favorable. Supt. J. B. Patterson has 28 men at work at the Eclipse mine sinking shafts and in other ways preparing for a systematic working of the mine. Some very rich ore has been taken out. W. Stewart and W. McGillivray are laying up a big bank account. They are working a bar in the Middle Fork, just above Horse Shoe bar, and have taken out as high as 30 ounces in a day. The crushing and amalgamating mill invented by Mr. A. C. Bowen of Michigan Bluff, and exhibited by him at the fair, is being tested by some of the miners in the vicinity of Auburn. In the north gangway in the Mayflower mine, a drift has been run 300 feet in length, through a kind of yellow quartz gravel and sand. This new channel, or whatever it is, crosses the regular channel almost at right angles, and is about 14 feet deeper. In sinking through it a layer of cement was struck some six or eight feet thick, below which was the yellow gravel again. Good prospects have been taken from it. The gold is black. Miners are puzzled about the yellow deposit. Some think it is the Orono channel and others will give no opinion.

San Benito.

QUICKSILVER.—Hollister *Free Lance*, Sept. 14: Seven hundred pounds of quicksilver are now shipped about every week from the Gypsy mine in Lone Tree.

San Diego.

DEEPER. — Julian *Sentinel*, Sept. 14: W. H. Dilks has secured the contract for sinking the shaft at the Washington mine 100 feet deeper, and a full crew of men is now making things lively in the gulch up back of town.

DISCOVERY OF GOLD.—*San Diegan:* Gold was first discovered in Pine valley, so far as known, by Mr. Wilcox of Julian, who two years ago found a 6-foot ledge, which he worked a short time and then abandoned. About a year ago John Noble of San Diego, accompanied by a man named Reece, found at the end of five months' persistent prospecting, a very rich but narrow ledge. The Eureka was thoroughly tested and shown to run $130 per ton. Its discovery was soon followed by that of another ledge, 42 inches wide, and now known as the Bay View, which showed plenty of free gold $200 to $300 per ton. Noble and his companions kept quietly at work, and other prospectors soon joined them. Noble's camp was established on a good footing, and then eight or ten rich ledges were opened a little north and resulted in the foundation of Deer Park camp. Among those interested in Deer Park camp are: Messrs. Hawkes, Seybolt, Fulton, Patrick, A. H. Julian and Dr. Rood, all from San Diego. Four miles northeast of Noble's camp, claims have been located by Messrs. O'Neil, Burke and others from San Diego. In Noble's camp Messrs. Goodbody and sons, Cherry, Hadley, Bean, Jux, Batch, Jaycox, Withrow, Clarke and son, Fisher, Ellingwood and others have claims. At head of Pine creek, near the edge of the desert, very rich rock has been found. The general formation of the country is slate, but there is plenty of granite, porphyry and native rock. There is an abundance of pure mountain water, good wood and grass. Pine creek will average 24 to 40 miners' inches the entire year, and there are other flowing streams as well. Many stamps can be run by the power furnished from Pine creek. A two-stamp mill has just been built at the Standard iron works in this city, and it is now being transported to Pine valley to be used in Noble's camp. Lumber is on the ground for a 900-foot, 12-inch flume, and likewise 190 feet of 8-inch iron pipe to conduct the water to a Knight's turbine wheel, which will run the mill. An 80-foot fall is secured. There are now fully 125 miners and prospectors in Pine valley, nearly all from San Diego, and 100 of these have gone in within the past four weeks, and it begins to look as though a mining boom was well underway. The Pine Valley Mining District has been organized with L. H. Cherry for recorder. A gold brick worth $250, the result of preliminary work, is evidence of the richness of Noble & Co.'s claim.

Shasta.

OLD DIGGINGS.—Redding *Free Press*, Sept. 14: Hart & Fleming have put two new Triumph concentrators in their mill.

Sierra.

THE BUFFALO MINE.—Cor. *Mountain Messenger*, Sept. 14: The Buffalo mine, in Hog Canyon, seems to the general public to be a failure, and it is, no doubt, to the present stockholders, as it is now lying idle. They are all poor men and have not the means to pay off the indebtedness and put in proper machinery to try by some more scientific means to save the gold. In my opinion that is all the trouble. There have been absurd reports floating around that it is not gold that the rock contains, but is some other metal. Now, I have been gold mining for 40 years and think that I ought to know gold when I see it, especially in its native state, either in quartz or gravel, and to satisfy myself or rather contradict that absurd report, we have kept some prospects in acid for 24 hours, and it had no effect on the metal. When such false reports are started, they not only affect the prosperity of one mine but the whole of that industry in the county. As I said, the owners of the Buffalo are poor men and their experience with such rock generally is limited; but of one thing I know, some of the prospects, both from the decomposed and solid quartz, would surprise the best experts in the State. There is one certainty, that the gold cannot be saved by the present milling process, for it went in the shape of amalgam, out of the batteries, over the plates and into the creek, for we have found quicksilver and amalgam half a mile below the mill. Good, experienced miners say that the Buffalo is so situated and the rock so easy to extract that it would be one of the biggest paying mines in the county if they could make it pay $3 per ton; but of course to do that they must have new arrangements to save the gold.

LOGANVILLE.—*Mountain Messenger*, Sept. 14: Work at the Marguerite mine is being pushed ahead vigorously. The music of the Knight wheels can be heard night and day at both hoisting works, which gives the place a little more life than before. The pumping engine is ready to start and the work of lowering the pump will soon be in order.

Siskiyou.

QUARTZ.—Yreka *Journal*, Sept. 18: Spencer & Co. have taken out about 100 tons of quartz from their ledge on Humbug, for which they say they would not take $30,000, and it is probable much more will be realized when it is crushed. Boyle & Co., at head of north fork of Humbug, are taking out considerable more quartz, and will soon have another lot of their $75 per ton ore ready for crushing. The scarcity of water on Hungry creek has stopped quartz mining until the rains commence, when it is expected good returns will be realized, the Fairy Queen mine having paid very rich as a sample, when water was obtainable to do any crushing. Messrs. Hutchings & Clark realized over 101 ounces from 22 tons of quartz crushed at Humbug creek last week. When the Hegler Bros. and Bruce Aldrich prospected and commenced working a quartz ledge on Humbug creek less than two years ago, there were no neighbors within several miles of them. Now the entire creek and mountains in the vicinity are full of quartz miners, all doing well, and in a short time Humbug will become one of the best mining sections on the entire coast. The work of fixing up and preparing for winter operations has been commenced by the San Jose Ditch and Mining Co. at Scott river, engaged in hydraulic mining at Whiting Hill, one of the richest claims in the county. Mr. Campbell, the energetic superintendent, has charge of the claim and ditch. Mr. Hunt, the superintendent of the Quartz mine, at Quartz Hill, Scott river, is now at the claim, with intention of making preparations for winter, in getting out quartz and starting the mill in operation.

Trinity.

THE ENTERPRISE.—Trinity *Journal*, Sept. 14: Mr. Chas. Lobdell, one of the owners of the Enterprise mine, informs us that the mill recently constructed on that mine in East Fork is completed and in fine running order. The mill began crushing rock from the Enterprise this week, using five stamps. The company has 150 tons of Enterprise rock on the dump which will be crushed first. Next month they will crush ore from the Lone Jack, of which they now have out over 100 tons. They could have had more rock from this ledge, but lacked facilities for dump. An ore chute will be constructed to run ore from the Lone Jack, the coarser ore running to the rock-breaker. The arrangements are such that the ore will not have to be handled at the mill at all. The company is working 21 men, and the future of the mine looks very bright. Mr. Lobdell is also interested with Mr. J. R. Flagg in several locations on Rich gulch, on which considerable work has been and is now being done. The prospects are very flattering.

CANYON CREEK QUARTZ.—From Supervisor Flowers we learn that the quartz prospects above Canyon City are looking very favorable. Bailey & Flowers have three ledges situated on the ridge between Canyon creek and Steuart's fork, about 5½ miles above Canyon City. The largest ledge is seven feet in width; the other two are five feet and six feet respectively. Each ledge carries free gold and sulphurets and prospects well. The upper ledge is decomposed on the surface for a distance of three feet from the hanging-wall and about as much solid quartz adheres to the footwall. The formation is porphyry. They are running a tunnel to tap the middle ledge; they are now in 30 feet and expect to tap the ledge this week. This tunnel will tap the upper ledge at a depth of 100 feet. From the dip of the upper and lower ledges it is probable that the three ledges will ultimately run together, forming one large ledge. Dedrick & Jones have seven locations. Mr. Jones is now at work on them. Grigsby has several locations which prospect well enough to justify him in putting up an arastra, which he will do right away. He has made a trail and procured the necessary lumber. All indications point to a good quartz country around Canyon creek. The camp in early days was rich in heavy gold, and the characteristics of the neighborhood are such as indicate the presence of gold-bearing quartz. The discovery of the present ledges will stimulate further prospecting and development, and we confidently

expect to see the lively times of early days reproduced in Canyon City and another quartz camp adding to the material progress of the county.

Tuolumne.

STARTED UP.—Tuolumne *Independent*, Sept. 14: The Rising Sun mine has been started up again, and is under the efficient superintendency of Mr. J. H. Neale, who has also placed the Santa Maria mine in operation. Mr. Neale informs us that he expects to have the Spring Gulch mine in operation in the near future.

THE TEN-STAMP MILL on the Mary Ellen mine, near Groveland, is now completed, and five stamps were started last week on good rock. The mill works splendidly, and the mine is expected to keep it supplied with first-class ore.

SPECIMEN.—We were shown a fine specimen this week by Charley Smith. It was a gold specimen in the form of a small brick, weighing 6¾ ounces, and valued at $126.66. The gold came from Charley's mine on Brown's Flat.

THE DEAD HORSE MINE, at Summersville, closed down last Saturday on account of no water.

NEVADA.

Washoe District.

SCORPION.—*Enterprise*, Sept. 14: On the 520 level, at a point 15 feet back from the face of the main drift, a south drift has been started, and has been advanced a distance of 45 feet in soft porphyry.

HALE & NORCROSS.—On the 500 level the upraise from east crosscut continues in good ore. Have temporarily discontinued work at this point until ore shipments are resumed to the mill, as our ore-house is about full. From the north drift on this level, at a point 260 feet south of our north boundary, have started an east crosscut No. 2.

SAVAGE.—On the 500 level are extracting ore of a good quality from the north drift from the west drift in the upraise. In No. 2 west drift the upraise was extended seven feet and continues in fair-grade ore. On the several levels and in the shaft men are engaged in making repairs, in easing timbers and in prospecting.

CROWN POINT.—The 800 south drift was advanced 23 feet and the face is in porphyry, showing stringers of quartz. The 800 west crosscut is out 120 feet, and the face is in porphyry and quartz, with a little water running from it. The ground at this point presents a very favorable appearance.

GOULD & CURRY.—The north drift from west crosscut No. 2, on the 300 level, is still being advanced in a mixture of porphyry and clay. No. 1 west crosscut on the 400 level is in a formation consisting principally of porphyry.

BELCHER.—The raise from the 1200 level has connected with the 1100. It was in low-grade ore during the upper half of its course. On the 200 level, the face of the east crosscut is in low-grade quartz and clay.

EAST SIERRA NEVADA.—On the 520 level, at a point 15 feet back from the face of the main drift, have started a south drift and advanced it 45 feet in porphyry. Some water is coming in at the face of the drift.

BEST AND BELCHER.—The northwest drift on the 550 level continues in vein material of a promising character. A considerable amount of work in the way of making repairs is being done on the 1000 level.

OCCIDENTAL.—Are extracting weekly between 400 and 500 tons of ore averaging a little over $18 a ton. This ore is coming from the 350, 400 and 450 levels. The concentrating apparatus is doing good work.

SEG. BELCHER.—The usual work is in progress on the 100 and 1100 levels. The circulation of air on the latter is excellent since the connection was made between the south drift and the south crosscut.

OVERMAN.—A considerable amount of prospecting is in progress in various places in the mine. Some repairs are also being made. The general appearance of the mine is promising.

CONFIDENCE.—The joint Confidence, Challenge and Imperial north drift on the 500 level is now in 880 feet from the Yellow Jacket shaft; the face shows quartz and porphyry.

UNION CON.—No. 2 crosscut west from the north lateral drift on the 1465 level is still in vein porphyry containing streaks of clay, from which there is a small flow of water.

OPHIR.—The east crosscut from the shaft station on the 1300 level to connect with the raise from the 1465 level is making good progress. The face continues in porphyry.

SIERRA NEVADA.—Good headway is making in the south drift from the main east drift on the 520 level. Some water is coming in at the face of the drift.

EXCHEQUER.—The principal work is on the 382 and 500 levels. The west crosscut on the 500 level is being advanced in quartz that is showing some metal.

ANDES.—Prospecting is active both above and below the 350 level. Some ore of low grade is being obtained from the raise above that level.

JUSTICE.—The ore-producing sections of the mine continue to yield well and the average of the battery samples as good as any on the lode.

WARD COMBINATION SHAFT.—The shaft is repairing to the 1700 level. All is being brought into good working shape as rapidly as possible.

BALTIMORE.—Are prospecting to the westward on the 225 level. A considerable amount of ore is still showing on the 300 level.

MEXICAN.—The drift north from west crosscut No. 1 is in a mixture of quartz and porphyry of a favorable appearance.

NEW YORK.—The raise from the west crosscut, 800 level, is up on the slope 81 feet, and the roof giving fair assays.

ALPHA.—Prospecting on the 382 and 500 levels. On the former some low-grade ore has been encountered.

CHOLLAR.—The north lateral drift, 750 level, is out 58 feet; face in quartz and porphyry giving low assays.

SILVER HILL.—A good deal of prospecting is in progress. This is principally on the 160 and 200 levels.

POTOSI.—Work is being done on the 150 and 850 levels. No change of formation since last week.

UTAH.—No. 1 west crosscut continues in vein material in which clay and quartz predominate.

CON. CAL. & VA.—Ore is being extracted from the stopes of all the levels from the 1400 down to 1950 level. A good deal of work, both in the way of extracting ore and prospecting, is being done on the 1650 level. The ore body found at the bottom of the winze below the 1950 level continues to yield well, both north and south, also upward.

NORTH OCCIDENTAL.—Ore of good quality is being extracted from the stopes on the 400 level.

CON. IMPERIAL.—The north drift on the 300 level is still in quartz that carries some metal.

YELLOW JACKET.—Are still shipping an average of 50 tons of ore daily to the Brunswick mill.

ALTA.—The ore that is being worked comes from the 925 level. It is of good quality.

Morey District.

SHIPPING ORE.—Belmont *Courier*, Sept. 14: Henry Metz informs us that the Magnolia mine continues to look tiptop. The lessees are shipping from 80 to 100 tons of first-grade ore per month to Salt Lake City, for reduction. Supt. Cohen and a party of capitalists were expected to arrive at Morey from the East on Wednesday last.

Osceola District.

DITCH.—White Pine *News*, Sept. 14: There are now 200 men at work on the new water ditch being brought into Osceola, and the old camp is said to be assuming a lively air.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Sept 14: North drift, 250-foot level, extended 17 feet. The face shows spar and iron with low-grade ore.

DEL MONTE.—North drift, 225 foot level, extended 13 feet; the face looking very well. Joint crosscut, same level, extended 16 feet in vein matter with low-grade ore. North drift, 100 foot level, extended 8 feet; the whole face is in ore, some of it high-grade.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 16 feet. Have no trouble in handling water. The concentrator has been started on the low-grade ore already extracted. Everything running nicely.

NAVAJO.—The crosscut from the south drift, 350-foot level, extended 18 feet. Upraise at the south end, same level, extended 11 feet; total 118 feet. The vein, though small, continues to carry high-grade ore.

COMMONWEALTH.—100-foot level: No. 14 north drift, from No. 13 west crosscut, has been extended 16 feet; total length 156 feet; face still in vein matter showing high-grade ore in top of drift.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 16 feet in vein matter and low-grade ore. Main south drift, 100-foot level, extended 13 feet.

GRAND PRIZE.—Water lowered 16 feet during the past week. Everything at mine and concentrator running smoothly.

ARIZONA.

CHLORIDE NOTES.—Mohave *Miner*, Sept. 14: Wm. Brakeman is chloriding on the Independence. Roger Bros. and Canas are getting lots of good ore in the Tintic. Harry Ewing and Joe Prisk are getting good ore at 90 feet in the Tuckaho. Jack O'Brien and Jim Dougherty are still at the Schuylkill, turning out carloads of lead ore. Geo. Darden and Henry Strawbell are getting good gold ore from their claim, situated near Painted Rock spring. Tommy Stinson is located near the top of Surrum's peak, at what was once known as the Penberthy mine. Tom is getting high-grade ore. Dan McKinnon is piling up quite a lot of good ore at the Altata. Steve Smith is moving up on the west slope of Surrum's peak, where he will establish a camp and commence developing a promising claim which he located last spring. Juan Garcia and Martin Jiminez are preparing to do lots of work on the Gold Back. They have been busy the past few days packing timber, tools, supplies, etc., for sinking an additional 100 feet. Their ore is gold and silver. A. M. MacDuffee is still working on the Rustler with good results, and is getting out some very high-grade ore, way up in the thousands. This is an old claim that has lain idle for years.

BRADSHAW DISTRICT.—Prescott *Courier*, Sept. 16: The Petrie mine, Bradshaw district, owned by Geo. W. Sines and L. Elliott, is said to be rich in gold and silver. A tunnel that will prospect the vein deep down is being run. Frank McCabe, owner of a couple of mines in Big Bug district, between the first of March and July of this year, secured gold worth $1700 out of his Sink to Rise mine. This amount was taken in one arastra. He also, in same time, shipped several tons of rich ore. Two miners worked for him.

CONGRESS.—Between 20,000 and 30,000 pounds of sulphuret ore from the Congress were brought in yesterday for shipment. The Silver King mine, Groom Creek district, is at present very much talked about. At a depth of 80 feet the vein is strong and very rich in both gold and silver.

COLORADO.

ASPEN.—Cor. Denver *Tribune*, Sept. 14: There has never been a time in the history of Aspen when the mining outlook presented so many promising features. This has the reputation of being what is called a "winter camp," that is, a camp in which the greatest activity is during the winter months, and in which the leading discoveries are made during that season. Both north and south of Aspen important developments are taking place. In Hunter park, to the north, the richest ore yet brought from that section was recently taken from the Myra. It is not yet found in quantity, but there is a splendid prospect that a pay mine will shortly be opened at that point. The Mineral Farm, on the north side of Smuggler mountain, is at last opening into pay. The Bushwhacker, also on Smuggler mountain, has struck some ore and gives promise of becoming a pay mine. The Smuggler Co. has entered upon an extensive plan of development of that famous property. The main level is being driven northward, and is coming into ore that is of better grade than the great chute near the shaft. The Mollie Gibson is looking better every day. A rich chute was recently opened at a point midway between the first and second levels. While this is an important matter, other features of the development are more so. The grade of the general ore body is improving. On Aspen mountain the old mines are all improving, and some new properties are opening up. Several of the leases that have made such a great record during the season are just expiring, notably the Edison and Celeste, and such properties will not be active producers again until the owners have had time to straighten them up and open new ground. The Carlisle, a Tourtelotte park fraction, has opened up a six-foot body of ore that runs from 30 to 60 ounces silver per ton. The Julia and Mackey, another Tourtelotte property that struck ore some two weeks ago, looks well. Further south on Richmond hill ore has been found in the Little Annie during the week that runs as high as 5700 ounces. It is found in connection with an exceptionally large body of spar. Those familiar with the Aspen formation know that this indicates a probability of a body of rich ore in the vicinity. In the immediate vicinity of Aspen the mines are making a remarkable record. The Compromise is increasing its shipments. It is also rapidly building its tramway, which will enable it to run its output up to 300 tons per day. During August the average daily production was 175 tons. The Aspen mine eclipsed its record during August, and the dividend for that month is estimated at $150,000.

DAKOTA.

THE LIDA GROUP.—Deadwood *Pioneer*, Sept. 14: Thos. S. Bentley came in Thursday evening from Elk Creek, where he is developing the Lida group of mines owned by himself and Harry Smith of this city. A tunnel recently commenced has now been driven 20 feet. Its whole face is in free-milling ore of better than average grade. A mill test of 62 tons of ore taken from other openings on the property gave returns of $7.62 per ton. The new strike is thought to be of even better quality. It develops, as the *Pioneer* stated on chronicling Mr. Miller's departure, that his trip to Chicago is to purchase machinery for a plant to do dry smelting. The plant will go up here this fall. C. H. Kingman and others of Chicago are interested. From what can be ascertained at this end of the line, machinery will be here within a very little while. The establishment of such works will produce a very healthy and much-needed revival of activity in mining circles, by which better times than the city has known in years will be created.

IDAHO.

SAMPLE.—Ketchum *Keystone*, Sept. 14: Milt Mourning shipped 21½ tons of ore from the Idaho mine at Boyle mountain and has been busy during the week having it sampled. The first-class ore yielded 140 ounces silver, 70 per cent lead and $3 gold per ton. The second-class ore went 53 ounces silver, $7.56 gold and 46 per cent lead per ton. Deering, Montgomery and Collins shipped a lot of concentrates from the Allen group of mines on Warm Springs creek during the week, which sampled 94 ounces silver and 45½ per cent lead. John Anderson and Wm. Goring have taken a lease on the Rob Roy mine. This mine is a relocation of what was once the Back Pay, and is situated about two and a half miles east of Ketchum.

SAWTOOTH.—The Vienna M. Co. have several men at work exploring and upraising from the lower works of the Vienna. The Silver King mine has been closed down for the winter. S. H. Hays has a lease on the Pilgrim mine at Sawtooth and is working three men. Two men are running a drift on the vein in the main tunnel of the Justice mine at Sawtooth, owned by Ole Opeland and others. They have found some very good ore. John Lynch is still working the Eagle mine, which is situated about a mile above the Pilgrim. With continued work the mine is making a very good showing. Although none of the large companies, excepting the Vienna, who own mines in the Sawtooth district, are working their properties, still there is considerable work being done on many different mines in the district by individual owners and lessees.

TEST.—Idaho *Avalanche*, Sept. 14: The Nellie Stoddard mine is now being opened under the immediate supervision of Mr. Shuman and is showing good ore, about 25 tons of which are now being put through the Oro Fino mill as a test.

GOLD.—On Thursday, Mr. Morkill, superintendent of the Poorman group of mines, came down from the Oso with a handful of ore just taken from the face of the drift with gold in it as large as grains of wheat. He informed us that the workmen had passed the porphyry dyke to where this heavy gold was found. The lode is two feet wide and prospects wonderfully in gold.

MONTANA.

HOPE.—Phillipsburg *Mail*, Sept. 12: Everything is in readiness now for the starting up again of the Hope mill. Many of the old employes have resumed their stations. John Adams will assume the foremanship of the mill. The ore in the Hope mines has been getting richer and more extensive of late, and it is claimed by those who ought to know that the large body they have recently struck is richer than anything ever before discovered in the mine. In the Porter lode, winze No. 2, the ore body is rich, and assays 100 ounces per ton, silver. The drift south is about completed, and all work now being done is entirely satisfactory.

GRANITE MOUNTAIN.—The output for the week ending September 12th was 49 bars of bullion, containing 71,500.25 ounces fine silver and 145.953 ounces fine gold.

DRUMLUMMON.—The following is the output of the Drumlummon mine for the month of August, 1889: Fifty-stamp mill crushed 3270 tons, yielding $69,600; 10-stamp mill crushed 500 tons, yielding $19,500; 60-stamp mill crushed 2900 tons, yielding $21,100; total, $110,200; working expenses, $55,000.

A RAILROAD TO THE MINES.—Anaconda *Review*, Sept. 14: From a gentleman who visited Oro Fino, Tuesday, we learn that the Union Pacific surveyors are still operating in that district. They are trying all of the different ways of getting out of the camp into the valley in order to determine upon the best grade, and at the same time make the proposed line easy of access for the various properties in operation or course of development. The demand for a railroad to Oro Fino increases with every property developed, and it is only a question of time when one will be built.

BUTTE NOTES. — *Inter-Mountain*, Sept. 14: Moulton is working 20 or 30 men developing the property all through the mine. The mill stands idle, owing to the shortage of water. If water sufficient were on hand the mill would start up immediately, as the ore-bins are full to overflowing with very near as much in the chutes as in the mine. The Alice's 60-stamp mill is running at its full capacity on ore taken exclusively from the mines of the company. The Clark's Fraction is working about 15 men, producing some very fine ore from the mine. The ore of the best quality is reduced at the smelter of the Butte Reduction Works and the Colorado smelter. The Eagle is taking out some very fine ore, the low-grade going from 40 to 60 ounces, while the better quality goes about 150 ounces. The Black Rock, east of the Elm Orlu, is shipping considerable ore and giving employment to about 25 miners on a shift. The shaft is 250 feet, and a sufficient quantity of ore is in sight to run for some time to come.

AT ARGENTA.—*Inter-Mountain*, Sept. 14: The Tuscarora smelter is being run regularly on ore from the late Scott mines. Mr. Scott is operating the smelter on a lease, and as he has immense reserves of ore in sight, the Tuscarora smelter will no doubt run continually during the term of his engagement. The P. J. Kelly Placer and Quartz Mining and Reduction Co. will have their smelter completed by the first of the month.

AT DEWEY'S FLAT.—The company that purchased the Lone Pine, the Partridge Bros.' property, are now busily engaged in erecting a mill to reduce the ore. The contracts were let during the past week for the building of a branch road from a point on the Butte & Gallatin railroad to Pony and Red Bluff. This will open up a mining region that has been languishing for years for the want of railroad transportation. When the road is completed it will make a showing for itself. Ore that was shipped out of there had to pay wagon freight for 40 miles over a rough country, and a large saving will be made in this one item.

NEW MEXICO.

LONE MOUNTAIN.—*Northwest Sentinel*, Sept. 14: A few leasers have made money, as a rule, by shipping ore to Socorro, El Paso and other points. The average cost of shipping and treating the past year has been $32.50. Ore can be milled here at less than half the smelter charges, and the freight by team and railroad will be saved to the miner, and Silver City will, in a great measure, reap the benefits. The miners are now all working on good ore. Bisby & O'Neil have just encountered a fine body of high-grade ore in the Monarch. The ledge is 18 inches and will average 200 ounces. Ealsch & McCarty are now taking out 250-ounce ore at a depth of 40 feet on the Home Ticket. Fifteen tons taken out of this shaft before the present leasers took hold of it yielded 150 ounces to the ton.

PINOS ALTOS.—Silver City *Enterprise*, Sept. 14: The vein system on the west side of Whisky creek consists of a series of parallels, and the developments thus far indicate that with depth, these will converge and form into one vein. The Minnesota crosscut tunnel furnishes an illustration of this. The tunnel is 200 feet in length, and it is expected that the main vein will be tapped during the week. The owner, Mr. Harry Fowler, will develop it for all its worth. Assays and mill runs show the ore to be worth $40 per ton. The crevice is wide, easily worked, and taken as a whole the Minnesota is one of the best propositions in the district.

COAL.—The Mexican Coal Co. of Socorro county, N. M., has disposed of its coal-fields, situated 15 miles from the Gem City, for the sum of $10,000 in cash and a certain amount of unassessable stock. Julius Wellghausen of Central has been having some ore treated from his Gulch mine. The concentrates are worth $100 per ton. D. B. Lewis has sold a one-half interest in the Grand Tower group at Gold Hill, to J. P. Forbes of Ohio, the consideration named in the deeds being $15,000. The property is now owned by Mr. Forbes and George H. Utter of this city. Arrangements have been made with M. W. Bremen to treat the ore in this city. Teams will soon be at work hauling the ore to the mill. Nothing less than 40-ounce ore will be hauled in.

UTAH.

PARK NOTES.—Salt Lake *Tribune*, Sept. 16: The Crescent tramway engine is again laid up for repairs, the crank shaft having broken this week, and nothing can be done until one is received from the factory in Ohio, which will probably be a week or ten days. Everything is looking very favorable at the Woodside and considerable work is being done. A few days ago, while sinking in the shaft, a fine boulder of ore was struck which assayed very high. Nothing is being done at the Anchor shaft, and the chances are that another new hole will have to be started from the top. At the Anchor tunnel they have recently gone through a nice body of ore, but what the extent of it is cannot be positively ascertained.

COMSTOCK IMPROVEMENTS.—A large force of carpenters is at work at the Comstock putting up new buildings and making things comfortable for winter's work. A crosscut is being run in the tunnel which has a very promising look, and another good strike is expected to be made every day. Mr. Dusseldorf, the manager, left for Europe Saturday morning to consult with the directors as to the advisability of putting in heavy machinery so as to develop the property more advantageously.

TO WORK THE GLENCOE.—Col. Shaughnessy was in town the early part of the week and concluded arrangements to work the Glencoe. A contract has been let to drive a tunnel 400 feet through the Fourth of July and other adjoining claims, which will tap the Glencoe 250 feet deeper than the present workings. As soon as the necessary arrangements can be made, which will be in a few days, a force of men will be put at work on the Glencoe stoping and taking out ore, of which there is a large quantity in sight. The work will be under the immediate supervision of Wm. M. Curtis.

OPERATIONS BY LEASERS.—Park *Record*, Sept. 14: Messrs. Thompson, O'Connell, White and McDonald have obtained an extension of six months on their year's lease on the Nevada-Northland property. The Park City M. Co. has leased its property to T. W. Thackwell and associates, who have already commenced developments. This is a promising property just east of the Woodside. The Wasatch is improving with each day's developments, and the ore chute is looking better than ever. Things are being got in shape for the winter and there will be no interruption to operations on account of the weather. Considerable ore has been taken out, which the leasers will send to market as soon as practicable.

MECHANICAL PROGRESS.

Mechanical Agriculture.

Agricultural implement makers are no mean customers of the iron and steel trades, and as the quantity of material which they absorb increases year by year, it may be of interest to briefly consider the rapid growth and development which their industry has shown. Of the quantity of iron and steel which goes into consumption annually by means of this agency, says a cotemporary, it is of course impossible to form even an approximate idea, but that it must be something considerable will be clear to any one who gives a moment's thought to the matter. Extensive works, the capacity of which is largely, if not entirely, devoted to this line, are numerously distributed over the country, while in every agricultural district there are minor establishments, the number of which is legion, dependent on this trade for their *raison d'etre*.

Those who visit our various State and county exhibitions, or who look over the advertising pages of our mechanical and agricultural papers, cannot fail to have been impressed, not only with the multiform ways in which mechanical art is now placed at the service of agriculture, but also with the rapidity of the progress made.

Especially if such an individual could carry his recollection back over 50 years, and compare the exhibitions of those days with those of the present time, he would be able to form some conception of the immense development which has taken place in this line during the past half century. From first to last there is scarcely an operation in agriculture but what is now performed or assisted by mechanical means, and while at the outstart of what we may call the actively inventive period, horse-power was the motor principally taken into account, that has now come to be frequently regarded as out of date, and has been extensively superseded by steam-propelled machines, while electricity in its turn bids fair at the present day to supplant steam for various operations.

During this progress our present degree of perfection has only been reached by gradual development and through many mistakes; but it is by means of mistakes success is attained, if only the mistakes be recognized and corrected; but, nevertheless, it would be well for our agricultural implement manufacturers to keep constantly before their eyes the paramount necessity for the nearest possible approach to simplicity. Complication means extra expense in every way, and additional danger of mishaps. We are, therefore, pleased to think that makers are now aiming at simplicity in their products more than has been the case in times gone by.

It must not be supposed, however, that although the successful application of steam to agriculture is of comparatively late date, the idea is a very modern one. A recent writer on the subject in *Bell's Weekly Messenger* states that as early as 1618 a patent was granted to two individuals in England for plowing land by steam. We should very much like to have some particulars as to this invention, which must have been a curiosity in its way. Steam plowing, although introduced to a limited extent in this country many years ago, has never come very extensively into vogue. Great improvements, however, have been made in plows driven by horse-power. It is perhaps, however, in the direction of mowing machines that the greatest inventiveness has been displayed, and the regularity and precision with which some of these do their work is really matter for wonder. In this direction California has done her full share, and in the complete harvester has given to the world the most useful, original and complete agricultural implement which has ever been introduced by any State or country. Viewed from the poetical side, there can be no comparison between the aspect of a harvest-field under the hands of reapers, gleaners and binders, and one which is being cut by means of an ungainly and noisy mowing machine, but in point of utility there can be no question as to which is the more profitable, and in these days the world is governed pretty much altogether by dollars and cents.

To go through a list of the various mechanical appliances now devoted to agriculture would be beside our purpose. Enough has been said, we hope, to suggest to the dullest mind the importance of cultivating an industry which has developed so rapidly in the past, and carries so much promise for the future, for, of course, our agricultural implement makers have, practically, the world for their market. It behooves the latter, on their part, while not allowing enterprise and invention to grow slack, to study to accomplish a given end by the simplest means possible. If this is kept well in view, cheapness and economy will be promoted, and the use of mechanical aids will assuredly extend yet further than it has done, for the benefit alike of the farmer, the implement-maker, and the iron and steel manufacturer.

RIVETING BY ELECTRICITY. — A Canadian paper gives an account of some welding done recently at an electrical exhibition at St. John, N. B. The account states that two pieces of boiler plate were effectually riveted by the electric process. The cold rivets were put through the plates and their ends held by clamps of the weld, which are so formed that they act as a die to form the rivet heads. The rivets were then heated, and when the right temperature was reached the clamps were pressed together, which upsets the ends of the rivets and formed a perfect head. Eight or ten of these, or even more, may be done at a time. It is said that work done by this method is so perfect that no calking whatever is required.

THE SAND-CORE PROCESS.—This is a peculiar and original process, and may be thus briefly described: When it is desired to apply it to steel manufacture, a case or box of sheet iron is made of the size desired. This is filled with finely powdered silica or fine sand, and placed in a mold a few inches from the bottom, so that the melted metal will run under and around its sides to the desired thickness. The metal is poured in and the work continued until the box containing the silica is covered on the top as well as on the bottom and sides, so that when the process is completed it contains within it the box of silica. The ingot is now ready to be manipulated as if it were solid steel, and can be rolled or drawn to a rod of less than one inch in diameter, or hammered into flat plates, or any other form desired. No matter how finely drawn or flattened, the sand core will be found in the center with the steel cover evenly distributed over it. The sand core, it is found, has the property of expanding and contracting equally with the metal covering it, so that when the article made from it is completed it is found to be so compact and solid as to give additional strength and rigidity to the article in which it is situated; this property makes it especially valuable when used for pillar supports or beams in building, for, in cases of fire, the core, being a non-conductor of heat, would prevent the column or beam from getting hot enough to impair its usefulness and safety. By this process, by varying the method of making the core so that it can be withdrawn, tubing of superior quality and strength can be made; even common gun-barrels, etc.— *Iron and Steel Trades Journal.*

PERPLEXING THE NATIONS.—Writing of the American section of the Paris Exposition, an intelligent observer notes that among the miscellaneous objects of interest from the United States are: Some very ingenious check tills or cash registers; oil stoves for quick cooking and boiling; the phonograph, telephones, and other electrical appliances from Edison and a half dozen first-class firms; the caligraph and other typewriters; telegraph and other wires and cables. But in every way, he adds, the most astonishing, popularly pleasing, and artistically perfect of American manufactures are those in plate and jewelry. What would have been thought half a century ago of the prophet who predicted not only that before 1890 there would be a new Birmingham in Alabama, alarming Pittsburg, and that the States would beat Britain in their annual output of iron and steel, but also that Republican simplicity would make New York the greatest diamond mart in the world, and develop the manufacture of plate and bijouterie beyond the wildest dreams of covetousness? Yet such is the fact. The world's exhibition of 1889 sees its most magnificent and expensive jewelry on view from New York, as well as a show of American silver-plate which fairly beats France on her own ground, and England, also, in true artistic merit, as at least two, if not all three, of the chief American exhibitors do any European firm in annual consumption of silver. Never was a more striking example of the truth of the old saying, "Nothing is certain except the unforeseen." There is a tribute in all this, however, reluctantly paid.—*American Artisan.*

COMPARATIVE STRENGTH OF STEEL AND IRON. The substitution for bolts, nuts, bars, plates, etc., of a tough, soft, manganese steel, in place of iron, was some time since proposed. Recently tests of a severe and decisive character have been made, with a view to ascertain whether bolts of such material are really strong and reliable as against the very heavy stresses and strains to which they are sometimes subject, and to determine whether the steel of which they are made would withstand bending, hammering close, and rough treatment in various ways, or whether such steel would only withstand heavy stresses slowly applied. Under these trials the metal is found to exhibit a toughness unsurpassed by any other, being easily nicked and bent round away from or close up at the nick. Bolts up to five-eighths inch were tested by holding the nut fast in a vise, and then hammering the bolt until it was bent downward at the screwed part through an angle of 130°, then taken out and doubled down and closed up with a heavy hammer on an anvil; but, though the screw threads were thus jammed up and compressed upon each other on the inside of the bend, and opened out to double their pitch on the outside, the steel did not break.

DYNAMITE GUNS.—The manufacture of dynamite guns is a new industry which has recently been introduced at Trenton, N. J. Six of these guns are now being constructed by the New Jersey Steel & Iron Co. The guns are to be 11 inches in diameter, and will be made in three sections. They will be constructed of cast-steel plates, bolted securely together. The guns are to be completed by Jan. 1st next.

AN ANCIENT AQUEDUCT, unruined and fit for present use, has been discovered close to Athens. It is in the suburb toward Hymettus.

SCIENTIFIC PROGRESS.

Science from the Eiffel Tower.

Eiffel Tower Meteorology.

Scientists seem to be making good use of the Eiffel tower in their experiments and observations.

At the summit of the Eiffel tower, says the *Scientific American*, there is installed a series of transmitting meteorographic instruments actuated by the variations in barometric pressure, by variations of temperature, direction and force of the wind, and other influences, and these instruments are connected electrically by means of subterranean conductors from the base of the tower to the Gallerie des Instruments de Precision in the Palais des Arts Liberaux. Here within the same glass may be seen in actual operation the records being made of the baro and thermo meteorograph and of the variations in the strength and direction of the wind transmitted electrically from a horizontal distance of a quarter of a mile and from a hight above the ground of close upon a thousand feet; and no better inducement to the public to make the ascent could be given, says "Engineering," than is supplied by the readings of the various records showing in torrid and airless galleries of the exhibition how very different are the meteorological conditions "upstairs." An interesting illustration of the perpetual freshness and strength of the wind at the top of the tower has been presented during the last week by the gradual destruction of the great flag of the French Republic, which has been waving over the gay city during the past six weeks. A few days ago the red band disappeared altogether, leaving the blue and white of another nationality to keep guard over the tower, and this week another band has disappeared, and the tower is at present surmounted by a red flag, to which are attached two streamers, the sole remnants of its former upper and lower edges.

The Eiffel Tower and the Spectroscope.

The Eiffel tower may be said to have commenced its expected career of usefulness as an aid to scientific investigation in a sufficiently startling manner. According to the Paris correspondent of the *Daily News*, M. Janssen of the Academy of Sciences claims to have made a discovery which upsets the entire theory based on the analysis of celestial bodies by means of the spectroscope. On a recent Sunday the electric lamps of the Eiffel tower were turned on the Meudon Observatory, which is 7800 meters (4 miles 7 furlongs) away. He reckons that the mass of air lying in a given section of that length at the hight of the tower is equal to the atmospheric mass above. M. Janssen argues from this that the number of molecules of air encountered by a beam of light sent from the Eiffel tower to the observatory is about the same as that met by sunlight on its way to the earth when the sun is near the zenith. He then shows that, if the analogy holds true, the belief that the sun contains oxygen is unfounded, and that if its spectrum contains the characteristic oxygen rays, this is due to the oxygen of our atmosphere. One of the fundamental theorems of spectrum analysis is that the width of the characteristic bands of a gas is proportionate to the number of molecules that intercept the light. Now, in the recent experiment the most important rays of the oxygen group were precisely similar to those of the solar spectrum. The conclusion M. Janssen draws is that there is no oxygen in the sun.

THE IRON AGE IN NORWAY.—A very interesting discovery, referring to the iron age, has been made at Gloppen, on the coast of Norway. A burial chamber, 12 feet in length, and formed of stone slabs, has been uncovered, containing the remains of a man. The find in the chamber also includes a bucket, ornamented with bronze, made of lime wood (*Taxus pacata*), two lanceheads of iron, 12 inches long, a double-edged sword in scabbard, with ferrule of bronze, and iron shield, a bronze buckle, some Roman gold coins, perforated and worn as ornaments, a glass beaker, green and blue in color, and ornamented with etched tracings, a pair of bronze scales, some iron arrowheads, and a pair of shears in a wooden case. On the body lay two large red stones and some bronze ornaments, having, no doubt, formed part of a belt, while some bear's hair and claws seem to indicate that the body rested upon a bearskin. The most remarkable part of the find is, however, that the lining of the coat around the neck was in a perfect state of preservation, and revealed rich embroidery of images of animals, an object of unique value, and that in the hands had been placed three interlaced wooden rings, resembling the well-known puzzle rings, an object never before discovered in ancient graves, and which has given Norwegian archæologists much food for speculation.

RAINFALL.—It is estimated that there are over 1,250,000 square miles in which the annual rainfall averages less than ten inches; that is to say, fully one-third of the area of the United States is deficient in moisture for the ordinary cereal crops or trees. An average of five feet of water is estimated to fall annually over the whole earth, and, assuming that condensation takes place at an average hight of 3000 feet, scientists conclude that the force of evaporation to supply such rainfall must equal the lifting of 322,000,000 pounds of water 3000 feet in every minute, or about 3,000,000,000,000-horse power constantly exerted. Of this prodigious amount of energy thus created, a very small proportion is transferred to the sea, and a still smaller fraction is utilized by man; the remainder is dissipated in space.

The Speed of Fishes.

The speed of fishes is almost an unknown quantity, being, as Prof. G. Brown Goode of the U. S. Fish Commission says, very difficult to measure. "If you could get a fish," said Prof. Goode to a Washington *Post* reporter, "and put him in a trough 1000 feet long and start him at one end and make him swim to the other without stopping, the information could be easily obtained, but fish are unintelligent and they won't do this. Estimates of the speed of fish consequently are only approximated, and more or less founded on guessing. You can tell, however, at a glance whether a fish is built for speed or not. A fast fish looks trim and pointed, like a yacht. Its head is conical-shaped, and its fins fit down close to its body, like a knife-blade into its handle. Fish with large heads, bigger than their bodies, and with short, stubby fins, are, of course, built for slow motion.

"The predatory fish, those which live on prey, are the fastest swimmers. The food fishes are generally among the slowest and are consequently easily captured. The loss is recompensed, however, by the natural law, which makes them very prolific in reproduction. Dolphins have been known to swim around an ocean steamer, and it is quite safe to say that their speed is 20 miles an hour, but it may be twice as much. The bonito is a fast-swimming fish. Just what its speed is I do not know. The head of the goose fish is very large—20 times as big as its body. It moves about very little, and swims at the bottom of the ocean. The Spanish mackerel is one of the fastest of the food fishes. Its body is cone-shaped and as smooth as burnished metal. Its speed is matchless as the dolphin, and in motion it cuts the water like a yacht."

A SEARCHING RAY.—As illustrating the far-reaching power of the electric arc, with suitable optical treatment, the fact is stated that the direct beams of the Tino light, which is near Spezia, have been observed at different times from the hill S. Giorgio, behind Savana, this being at an elevation of some 2700 feet and a distance of not less than 73 statute miles, the atmosphere being clear and the moonlight prevailing. The beams of the arc appeared very considerably brighter than those of the lantern light at Genoa, which is only one-third of the distance. In addition to these interesting facts, frequent observations are reported of the Macquaire light in New South Wales, at ranges of 60 to 70 miles, by means of reflections on the sky, while the light itself is below the horizon.

COMPRESSED AIR and electricity it would seem are to be the rival motive-powers of the future. It is stated that compressed air has been applied with great success in Paris to the propulsion of sewing machines, wood-working apparatus and printing machines. A correspondent of the the *Manufacturers' Record* suggests that "if some of our industrial or mechanical papers, or some of our engineers or mechanics, who are visiting Paris, would write a full history of the use of compressed air in that city, stating outlay for original plant, method of distribution, also stating the amount of power that may be furnished each consumer, and the cost of the same per horse-power, it might be doing our industries a substantial service."

BEFORE FRANKLIN.—It is said that a curious discovery has recently been made which shows that as far back as 1746 an Italian physician wrote a book called "Electricity, or the Electrical Forces of Nature," in which he discussed the nature of electricity and advanced many ideas that have since proved to be correct. The close relations between the phenomena of electricity and lightning were discussed, and a very close approach to the truth as since developed was made upon numerous points. Franklin's experiments with the kite were made on June 15, 1752, six years after the book above referred to claims to have been written.

YOUR OWN WEATHER PROPHET.—When a storm is advancing, the wind blows to meet it. Thus a wind blowing from the east or southeast indicates the approach of a storm from the west. When the storm center has passed, however, the wind changes and follows the storm. If a person has a good barometer and a wind-gauge he can tell pretty correctly when a storm is coming. Without the instruments the clouds may be watched, and when seen to be moving rapidly from the southeast, and there are indications of the presence of much moisture in the air, a storm is not far away.

A CURIOUS FUNGUS GROWTH may be seen, says the Worcester *Gazette*, at Oakdale, near Worcester City. On an old cutting-block there is a fungus growth the shape of a cabbage rose, with large unfolding leaves of a bright orange color in the center, shading to a pale lemon on the edges; the outside leaves are as large as a breakfast plate, growing smaller in the center. It measures three feet four inches in circumference and 13 inches in diameter, the whole growth being made in ten days. It presents a very beautiful as well as novel appearance.

Good Health.

The Use of Water.

There is no remedy of such general application, and none so easily obtainable, as water, and yet nine persons in ten will pass it by in emergency to seek for something of less efficacy. There are but few cases of illness where water should not occupy the highest place as a remedial agent. A strip of flannel or a napkin wrung out of hot water and applied round the neck of a child that has croup will usually bring relief in ten minutes. A towel folded several times and quickly wrung out of hot water and applied over the seat of the pain in toothache or neuralgia will generally afford prompt relief. This treatment in colic works like magic. A physician writes: "We have known cases that have resisted other treatments for hours yield to this in ten minutes. There is nothing that will so promptly cut short congestion of the lungs, sore throat or rheumatism as hot water when applied promptly and thoroughly. Pieces of cotton batting dipped in hot water and kept applied to sores and new cuts, bruises and sprains, is the treatment adopted in many hospitals. Sprained ankle has been cured in an hour by showering it with water poured from a few feet. Tepid water acts promptly as an emetic, and hot water taken freely half an hour before bedtime is the best cathartic in the case of constipation, while it has a most soothing effect on the stomach and bowels. This treatment continued for a few months, with proper attention to diet, will alleviate any case of dyspepsia."

Water in Digestion.

Opinions differ as to the effect of the free drinking of water at meal-times, but the view generally received is probably that it dilutes the gastric juice and so retards digestion, says *Medical Classics* Apart from the fact that a moderate delay in the process is by no means a disadvantage, as Sir William Roberts has shown in his explanation of the popularity of tea and coffee, it is more than doubtful whether any such effect is in reality produced. When ingested during meals, water may do good by washing out the digested food and by exposing the undigested part more thoroughly to the action of the digestive ferments. Pepsin is a catalytic body, and a given quantity will work almost indefinitely, provided the peptones are removed as they are formed. The good effects of water drank freely before meals have, however, another beneficial result—it washes away the mucus which is secreted by the mucus membrane during the intervals of repose and favors peristalsis of the whole alimentary tract. The membrane thus cleansed is in a much better condition to receive food and convert it into soluble compounds. The accumulation of mucus is specially marked in the morning, when the gastric walls are covered with a thick tenacious layer. Food entering the stomach at this time will become covered with this tenacious coating, which for a time protects it from the action of the gastric ferments, and so retards digestion. The viscid contents, a normal condition in the morning before breakfast, are not suitable to receive food. Exercise before partaking of a meal stimulates the circulation of the blood and facilitates the flow of blood through the vessels. A glass of water washes out the mucus, partially distends the stomach, wakes up peristalsis and prepares the alimentary canal for the morning meal. Observation has shown that non-irritating liquids pass directly through the "tubular" stomach, and even if food be present they only mix with it to a slight extent.

Silk Veneers.—One of the most remarkable uses to which silks and other fabrics are being put of late, says a contemporary, is the veneering of fancy furniture. This latest wrinkle has not as yet gone into general use, but the extent to which the idea can be utilized appears well-nigh unlimited. In the parlor of a house on West Walnut street, which is tenanted by a wealthy merchant, there is a very beautiful display of veneering in silk and cretonne. The walls of the large room are done in raised panels of plain wood, and over each of these panels a piece of silk, upon which is painted by hand a beautiful design of flowers, is stretched and tacked on the back of the panel so that there is not a crease to indicate the presence of so foreign a substance. Each alternate panel is covered with satin, and the sheen is simply beautiful under a mellow gas light. The idea has even been carried to the fragile little table that stands in the center of the room. That is covered with satin, on which a pretty baby face is painted by hand, and the substance has been treated with numerous coats of transparent varnishes which completely filled up the interstices in the fabric until it can hardly be distinguished from highly polished wood. This system of decorating has been found to be quite as cheap as the wood veneering, and in richness of appearance the silk veneers appear fully equal to the finest effects in woodwork.

The Curiosities of Taste.—A physiologist discoursing on the sense of taste says: Strictly speaking, with the tip of the tongue one can't really taste at all. If you put a small drop of honey or of oil of bitter almonds on that part of the mouth you will find, no doubt to your great surprise, that it produces no effect of any sort; you only taste it when it begins slowly to diffuse itself, and reaches the true tasting region in the middle distance. But if you put a little cayenne or mustard on the same part you will find that it bites you immediately—the experiment should be tried sparingly—while if you put it lower down in the mouth you will swallow it almost without noticing the pungency of the stimulant. The reason is that the tip of the tongue is supplied only with nerves which are really nerves of touch, not nerves of taste proper; they belong to a totally different main branch, and they go to a different center in the brain, together with the very similar threads which supply the nerves of smell for mustard and pepper. That is why the smell and taste of these pungent substances are so much alike, as everybody must have noticed, a good sniff at a mustard-pot producing almost the same irritating effects as an incautious mouthful.

Simple Relief for Lung Troubles.—It has long been known that pine-needle pillows would alleviate persons afflicted with lung troubles, and a Florida editor relates an incident in support of the fact as follows: During a visit to the home of a most estimable lady living on Indian river, this editor was told of a discovery that had been made which may prove a boon to sufferers from lung or bronchial troubles. This lady having heard that there was peculiar virtue in a pillow made from pine straw, and having none of that material at hand, made one from fine, soft, pine shavings, and had the pleasure of noting immediate benefit. Soon all the members of the household had pine-shavings pillows, and it was noticed that all coughs, asthmatic or bronchial troubles abated at once after sleeping a few nights on these pillows. An invalid suffering with lung trouble derived much benefit from sleeping upon a mattress made from pine shavings. The material is cheap and makes a very pleasant and comfortable mattress, the odor of the pine permeating the entire room and absorbing or dispelling all unpleasant odors.—*Scientific American.*

Revolution in the Process of Decorating China.—The old process of decorating china is likely to be revolutionized by a discovery made by J. B. Bonnaud, a Frenchman. By his method it is possible to obtain in a few minutes the same artistic effects which cost the hand-painter on china days of labor. Landscapes, groups of figures, and portraits are produced by this means on vases, plates and plaques, in their natural colors, even to the most delicate shades.

A Cholera Specific.—It is claimed that Dr. Loewanthal, who is in the employ of the French Government, has discovered a sure specific for cholera. It is a substance called salol, which upon being taken into the stomach is disassociated by the action of the pancreatic juice into salicylic acid and a minimum of carbolic acid, which is said to be just sufficient to kill the germ of cholera. Tests made with the remedy are said to be in the highest degree satisfactory.

Useful Information.

New Method of Preparing India-Rubber.—A new method of preparing india-rubber is announced, which, if successfully carried out, will have a marked effect on the rubber industry. The poor hulero (as the collector of india-rubber is called) has anything but an enviable lot. He has often to penetrate the deep forests in search of the trees from which the milk is drawn, and is exposed to danger from wild beasts as well as to frequent want of water. Weary and harassed, it often happens that he spills much of the milk on the way, and still more is lost by fermentation; and of the quantity that is actually brought into camp, it is not unusual to have to sacrifice at least 40 to 50 per cent of the contained rubber. The new process causes the rubber contained in the milk to be coagulated instantaneously, and secures every particle of contained rubber, as against the one-half which the present method gives, and, moreover, the rubber is at once clean and pure. The operation is so simple that any native can carry it out at the foot of the tree which has been bleeding, and thus, instead of carrying large cans of milk of great weight and entailing great loss on the way, he simply carries in the sack solid rubber, which, on his arrival at camp, can be at once prepared for the market and shipped. Several tons actually prepared on the spot by this new process are highly spoken of, and afford, what has long been desired, a clean, pure and dry rubber of the first quality.

To Restore the Freshness of Worn Clothing.—The mystery to many people how the scourers of old clothes can make them almost as good as new is explained in the *American Analyst* as follows: Take, for instance, a shiny old coat, vest, or pair of pants, of broadcloth, cassimere or diagonal. The scourer makes a strong, warm soapsuds, and plunges the garment into it, souses it up and down, rubs the dirty places, if necessary puts it through a second time, then rinses it through several waters and hangs it to dry on the line. When nearly dry he takes it in, rolls it up for an hour or two, and then presses it. An old cotton cloth is laid on the outside of the coat and the iron passed over that until the wrinkles are out; but the iron is removed before the steam ceases to rise from the goods, else they would be shiny. Wrinkles that are obstinate are removed by laying a wet cloth over them and passing the iron over that. If any shiny places are seen they are treated as the wrinkles are—the iron is lifted while the full cloud of steam rises and brings the nap up with it. Cloth should always have a suds made specially for it, as in that which has been used for white cotton or woolen clothes lint will be left in the water and cling to the cloth. In this manner we have known the same coat and pantaloons to be renewed time and time again, and have all the look and feel of new garments. Good broadcloth and its fellow-cloths will bear many washings, and look better every time because of them.

Sugar in China.—The Chinese, who invented almost everything before any body else heard of it, claim to be the original inventors of sugar-making. It is said the Chinese have used sugar for 3000 years. It is well known from other than Chinese authorities that they used sugar at least 2000 years ago. India also claims to be the inventor of the first sugar-making process, but the Hindoos undoubtedly obtained their knowledge from China. Nearchus was sent by Alexander the Great to explore the Indus, and brought back reports of "honey" which he said was made by the Asiatics from cane without the help of bees. At this time neither the Greeks nor the Jews, nor Babylonians, had any knowledge of sugar, but later the art of making the artificial "honey" became known and practiced, though its progress and development were exceedingly slow. It was prescribed as a medicine by Galen A. D. 150, and up to the 17th century it had become nothing more than a costly luxury, to be used on special occasions. Even as late as the beginning of the 18th century the annual consumption of sugar in Great Britain had reached only 20,000,000 pounds, whereas it is now more than 2 000,000,000 pounds. Refined sugar was not made in England till 1659. The art of refining was learned by a Venetian merchant from the Saracens, who sold the secret to him for 100,000 crowns.

Building from the Roof Down.—A visitor to Japan tells of the peculiar methods of construction employed in that country. "Speaking of house-building, the Japanese begin their work at the top. The roof goes on first, and then they begin to build the walls and to construct the interior. One of the greatest curiosities to me in Tokio is a new hotel which is being built. It is to be on the foreign style and is to have four stories. It will be the greatest hotel in Japan. It covers about an acre of ground. As yet not a stone of the foundation has been laid, but the roof is already up and this stands on a great four-story skeleton of scaffolding awaiting the building of the rest of the structure. This scaffolding is made of long poles from the size and thickness of a campaign flag-staff down to the size of a bamboo fishing-rod, and the whole is tied together with ropes. Imagine an acre of scaffolding of this nature upholding a heavy roof and the whole made up of sticks and ordinary rope. There are, I was told at the office, 7000 poles in the skeleton, and 2000 men had been at work for months in making it."

The World Full of Death Traps.—According to the *American Analyst*, the worst enemies of the human race are the doctors, who try to prolong our miserable existence in a world full of death traps. One medico tells you not to eat or drink what you relish because you will eat or drink too much. Another says you must only eat what you fancy, because otherwise you will bolt your food without giving to each morsel the 36 mastications which are necessary for digestion. You must wear a respirator over your mouth, a pad on your chest, and a swarth of flannel round your loins. If you live in town, you will die of fog; if you go to the country, you will be poisoned by bad drainage; if you drink water, you are tempting the typhoid fiend; milk spells scarlatina, and tea cake is sudden death. Do you shun these tempestuous pleasures of the senses and take refuge in the recreations of the mind? Do you borrow a novel from the circulating library? That is to import the germs of disease into a healthy household. The volume in your hands may have been perused by a person recovering from an infectious illness!

Caring for Furniture.—With care furniture may be kept looking nice for years, but without this care it soon becomes dingy and shabby. A thorough cleansing, once a month at least, should be given to upholstered furniture that is in everyday use. Articles covered with plush or any goods with a pile may be brushed with a bristle brush, but for haircloth a light switch works the best, wiping off the surface afterward with a damp cloth. Wipe the woodwork with a damp cloth, and if there are any dents in it, it is said the application of several thicknesses of wet blotting paper held in place, till dry, by a warm flatiron, will remove the dent, unless a very deep one, when several applications may be necessary. When the woodwork is dry rub with warm linseed oil and polish with chamois skin. White spots may be removed by alcohol simply pressed on the spot by a cloth that is not linty, and not rubbed, as rubbing will take off the varnish. A flannel cloth moistened with kerosene is good to rub the furniture with, and the disagreeable odor of the oil soon disappears.—*Woman's World.*

Engineering Notes.

A Great Engineering Project.—The construction of a ship railway across Chignecto neck, the narrow isthmus separating the bay of Fundy from the headwaters of the Gulf of St. Lawrence, and connecting Nova Scotia and New Brunswick, has been commenced. At present, vessels coming down the St. Lawrence and bound for St. John, New Brunswick, or for United States ports, must sail around the stormy coast of Nova Scotia, a distance of 700 miles. Chignecto isthmus is 17 miles across. The contracts for the work have been let, and cutting has been commenced in various sections. The work is estimated to cost £1,100,000 The Dominion Government has so much faith in the enterprise that it has granted to the company an annual subsidy of £35,000 for 20 years. If the earnings of the road exceed seven per cent then half the surplus is to be paid back to the Government until the sum advanced by it has been replaced. The work will be completed in 1892. The railway will lessen by 500 miles the distance between the St. Lawrence ports and the cities of New York, Boston, and Portland. Its effect on commerce will be immeasurably great. By being carried across the Chignecto Marine railway, American fishing vessels can make two trips a season instead of one. Grain vessels from the lake ports will reach New England direct. It means cheap bread and cheap fish. Ships will be lifted upon an iron cradle which rests upon wheels. They will be then conveyed by gigantic locomotive engines at the rate of ten miles an hour. The railway will carry ships of 1000 tons burden. It is designed especially for the lake and fishing trade. Ships will be raised upon the tracks by means of hydraulic lifts similar to the kind now used by dock companies.

Hydraulic Elevators on Canals.—The success of the French experiment has directed much attention to the substitution of hydraulic elevators in place of locks in raising canal-boats from one level to another. This mode is especially valuable in saving time when there is a number of locks in succession. The plan in such a case consists, briefly, of two "chambers," reaching the whole distance from the level of the canal above to that of the canal below. In each chamber there is a movable basin, resting on the head of an enormous piston, which goes down into a cylinder below the level of the lower canal, and this piston is worked by hydraulic pressure; the upright tubes can be connected or disconnected below by opening or closing an immense paddle-door—the basin containing the boat being thus made to slide up or down in the chamber, to the walls of which it is fitted. Supposing a boat to have moved into one chamber from the level of the canal below, and another into the other chamber from the level of the canal above—the superior weight of the higher boat and the water floating it in the basin rapidly sinks it, until both boats are in the middle, when an equilibrium would naturally occur. To remedy this, the water is withdrawn from the basin of the ascending boat, when a very moderate addition of hydraulic pressure causes it to rise to the level of the upper canal, as the other boat sinks to that of the canal below. By this means boats are raised or lowered in three minutes instead of six hours, as formerly in the series of locks. The chambers or tubes are, of course, very strongly made, being lined with copper and ribbed with steel.

Revolving Sails.—The Vogt system of the propulsion of ships by means of revolving sails acting in the air, has been discussed by the British Association for the Advancement of Science, the advantage to be gained over the ordinary form of screw propulsion being enumerated as follows: A saving in engine-power by eliminating the disturbing action of the screw; the form of the ship can be determined with reference to least resistance and seaworthiness only, and the division into water-tight compartments can be complete. The change in trim is less disadvantageous when the power is applied above the deck than below the center of gravity; the vibrations caused by the screw propeller, which are destructive to the ship and most unpleasant to those on board, are avoided; and such an air-propeller utilizes the natural wind-power. In its outward shape, this air-propeller is somewhat similar to the ordinary water screw, with sails or blades made of thin sheet steel, having the greatest width near the circumference. The pitch of the blades is capable of being varied in order to utilize the power of the wind according to circumstances, the fact being that nearly 80 per cent of the winds, the whole compass round, augment the thrust of the propellers in this arrangement.

An Aerial Railway.—Some Swiss engineers are planning an aerial railway by which they propose to connect two of the peaks of Mount Palatus with wire ropes about 2000 feet long, and to send tourists from summit to summit in cars sliding along the wires.

The Tehuantepec Route.—It is said that a Dresden bank has contracted to provide the Mexican Government with the capital to construct a railroad across the isthmus of Tehuantepec. The Krupps are to furnish the iron and steel for the road.

SAN FRANCISCO:
Saturday, Sept. 21, 1889.

TABLE OF CONTENTS.

EDITORIALS.—Prentiss Friction Shaper; Attaching Mine Cars to Ropes, 221. Passing Events; Silver Discoveries in New South Wales; Hydraulic Mining Abroad; Astronomical Society of the Pacific; Nicaragua Ship Canal, 223. Construction of Maps in Relief; Preserving Piles, 229.

ILLUSTRATIONS.—Prentiss Friction Shaper; Grips for Mine Cars; View of Corinto Harbor, Nicaragua, 221. Model Prepared for Photo-Mechanical Printing; Model of an Anthracite Coal Mine; Part of South Mountain, Equal Scales; Part of South Mountain, Vertical Scale Exaggerated, 229.

CORRESPONDENCE. — Sights and Experiences in Paris, 222.

MISCELLANEOUS. — San Francisco to Alaska; Wonders of Nature, 222. Amador County Mines; How to Save the Trout; Raisin-Making in California, 223.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 224-5.

MECHANICAL PROGRESS.—Mechanical Agriculture; Riveting by Electricity; The Sand-Core Process; Perplexing the Nations; Comparative Strength of Steel and Iron; Dynamite Guns, 226.

SCIENTIFIC PROGRESS. — Science from the Eiffel Tower; The Iron Age in Norway; Rainfall; The Speed of Fishes; A Searching Ray; Before Franklin; Your Own Weather Prophet, 226.

GOOD HEALTH.—The Use of Water; The Curiosities of Taste; Simple Relief for Lung Troubles; Revolution in the Process of Decorating China; A Cholera Specific, 227.

USEFUL INFORMATION—New Method of Preparing India-Rubber; To Restore the Freshness of Worn Clothing; Sugar in China; Building from the Roof Down; The World Full of Death Traps; Caring for Furniture, 227.

ENGINEERING NOTES.—A Great Engineering Project; Hydraulic Elevators on Canals; Revolving Sails; An Aerial Railway; The Tehuantepec Route, 227.

THE WATCHMAKER. — Electric Clocks and Watches; Modern Watch Dials; Watch Jewels; A Clock to Date Letters; How to Spoil a Watch; Watch Factories; Clocks and Watches in England, 230.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 236.

Business Announcements.

Passing Events.

During the past few weeks forest fires have been raging in many parts of this coast. In the mountains of the interior great damage has been done. Immense tracts of country have been burned over.

It is stated that deep mining will again be prosecuted on the Comstock in all the principal mines. The lower levels have been flooded, but will now be pumped out. This will give employment to more men.

Notice has been given that an ordinance will be introduced at the next meeting of the Supervisors providing for an inspection of steam boilers. The recent disastrous explosion at Oakland has again called up the subject of boiler inspection.

The silver discoveries in the Barrier district, N. S. W., have resulted in some wonderful mines being opened. Quite recently a mine supposed to be the equal of the Broken Hill has been developed. New South Wales is now turning out an immense quantity of silver.

ST. JOSEPH has met with a serious misfortune in the destruction of her main Exposition building, with all its contents.

Silver Discoveries in New South Wales.

To open up an almost abandoned mine where many fortunes had been made and lost, and to make its future assured, as it promises to be only second to the greatest silver mine in the world, is interesting in some of its details, but more so when it marks the dawning of an era in colonial affairs that will undoubtedly lead ultimately to a complete confederation of all the colonies. From Sydney, Adelaide and Broken Hill papers received by the last steamer, we find that great excitement was caused by a most remarkably rich discovery that had been made at the Central mine. This was even far more extensive than the rich find their general manager, Mr. F. F. Thomas, made in the month of June. At that time he opened up a body of ore 20 feet in width on the 300 level averaging 100 ounces silver per ton. He drifted on it over 120 feet, with same character of ore each end, and was still driving ahead each way. Now the topic of the hour in mining circles in the antipodes is their latest development in the Central mine and its general manager, Mr. Thomas. This mine adjoins the Great Proprietary on the south. It was prominent in last year's great silver boom. At that time a supposed bonanza on its 200-foot level was discovered, and the Central shares ran far beyond the legitimate value. The discovery proved a "short-curried horse," fortunes were lost, the manager resigned, the mine fell into disrepute, and, as an Australian editorial puts it, "for months the property stank in the nostrils of those who had invested in its scrip at high prices."

Another manager took hold of the property and he was quietly informed that the mine had been worked out. Making no improvement, it seemed that the Central was doomed; that the vein had cut out and was only a bunch of ore. He, too, resigned, and the directors looked this way across the sea. They possessed abundance of means to open up the property if some engineer could show them a mine. This, from all that can be learned of colony papers, Mr. Thomas has done. When he went from here to New South Wales as a mining engineer he was not only equipped with a fine technical education gained at Yale College, but also with the experience obtained in 25 years work in the mines on this coast. Those who know the gentleman will indorse the remarks of a Broken Hill paper, that the directors of the company are to be commended in the first place for their pluck in going to the expense of obtaining from abroad the experience that is necessary for the successful management of a large silver mine in all its departments, and secondly congratulated on their good fortune in obtaining such an able manager in the person of Mr. Thomas.

On his arrival the task before him seemed almost a helpless one from all the appearances of the drifts and crosscuts. We learn from the papers he set himself to the work of following up his plans in so systematic a manner that it left an impression at once; there was no pot-hole work about his operations. In sinking the main shaft he discovered the body of ore on the 300 mentioned above, and has not reached the end of the ore chute as yet in his drifting. In every winze and crosscut he struck pay ore nearly, if not every, time. On the 200 level he put his men to work in an abandoned crosscut (the face being, however, in hard silicious, barren rock) to carry out a cherished idea of his, to prospect for a western vein on this great fissure lode. The pump temporarily getting out of order, and water driving the men from the bottom level, it was his opportunity to push this crosscut with all dispatch. What was thought to be a country-wall rock proved to be of slight length; some five feet or more he broke into a vein of rich carbonate of lead ore, carrying chlorides and iodides of silver. The crosscut has been driven 22 feet, with no sign of the west wall, and the same character of ore continues. The colony papers say that, judging from all appearances and general characteristics, it will in all probability be found a very large body.

This wonderful discovery is simply tantamount to the finding of a new mine. It is generally believed that, without doubt, the Central mine has now the famous Proprietary vein, in all its richness.

The shares of the Central mine were selling at 9s. per share at the time of Mr. Thomas' arrival, and now from Melbourne and Sydney market quotations they are £6 5s. per share.

As to the immense importance attached to these recent discoveries of ore in the Central mine, we glean from Australian papers that it has awakened Sydney, Melbourne and Adelaide people, respectively, in New South Wales, Victoria and South Australia to the fact that Broken Hill and the Barrier possesses a trade which is now wooed on every hand. They all want it. At present, without going into statistics, Broken Hill and the Barrier is responsible for about 6 5 per cent of the world's silver production, and hence it must to some extent influence the price of the metal. The distance by rail from Sydney to Broken Hill via Melbourne and Adelaide is 1419 miles.

Hydraulic Mining Abroad.

Some of the hydraulic mines in the U. S. of Colombia, which are owned by residents of London, have been paying very well of late, notably the Colombian Hydraulic Co. and the Orita Hydraulic Co. The shares of the two concerns stand at about 100 per cent premium in the market. The former, on a capital of £75,000, has realized £25,449, of which the profit was £16,447, or 64 per cent of the gross returns. In the past 2½ years the company has returned half the nominal capital in dividends. English capitalists are much interested in this class of mines, but of course no longer invest in them in this State, though they hunt them up elsewhere.

It is of interest to note that an English firm which manufacture fire-engines, etc., have devised an engine for throwing a stream against a gravel-bank, so that water can be taken from any depth below where it is wanted, reservoired and brought to bear on any given spot. The apparatus is simply a modification of that used by the London fire brigade. The monitor is mounted on a carriage and can be directed at any angle close to the bank, or removed from it, with ease. Power is obtained from a boiler such as is used in torpedo boats. The monitor will throw a jet 250 feet above the position from which it is worked. The capacity of the pumps is about 1600 gallons a minute. A feature of this engine, and one to which considerable importance is to be attached, is this: That it may, in the first place, be used to pump water from a river miles distant into a reservoir; and then, with the same appliance, this water can be brought to bear upon any given spot as desired.

MR. JOHN A. BRASHEAR, the well-known astronomer and maker of astronomical instruments, has received a bequest of $2000 from the late Wm. Thaw of Pittsburg, and also free use of the residence and factory (which belonged to Mr. Thaw) for ten years. Some "prophets" are appreciated in their own country. Mr. Brashear visited San Francisco last winter and made many warm friends while here. As a maker of astronomical appliances and instruments of precision, Mr. Brashear has achieved an enviable reputation, both in this country and Europe, the large star spectroscope at the Lick Observatory being a tribute to his skill.

AMADOR COUNTY has been awarded the first prize in "county exhibits" at the State Fair. The premium is $500. Nevada county was awarded the second premium of $400; Colusa county the third of $400; San Joaquin county, fourth premium of $300; Humboldt county fifth premium, $300; Fresno county, sixth premium, $200; and Merced county seventh premium, $200.

CHAS. A. CLARK of Nelson, Butte county, showed us this week some coal, or lignite, which he took from a claim recently discovered by him in Washington Territory. A number of seams were found on the hill, the largest ten feet in width. The coal burns well. Mr. Clark is having an analysis made in this city.

THE CHARLESTON.—The Union Iron Works have tendered the cruiser Charleston to the Government. The horse-power developed was slightly less than the requirements, but it is not probable that the penalty will be enforced, as the vessel is highly satisfactory in all other ways.

IT required 2,500,000 bricks for the smoke-stack of the new Ryan smelter at Tacoma.

Astronomical Society of the Pacific.

The next regular meeting of the Astronomical Society of the Pacific will be held in the library of the Lick Observatory, on Saturday, Sept. 28th. Papers will probably be presented:

"On Drawings of the Planet Jupiter in 1880-85," by Mr. E. E. Barnard; same in 1875, by the president, E. S. Holden.

"On Relation Between the Diameter of a Photographic Star Disc, the Aperture of the Telescope and the Exposure Time," by Mr. J. M. Schaeberle.

"On Relation Between the Darkening of a Photographic Film and the Time of Exposure," by Mr. A. O. Leuschner.

Members will take the earliest trains (broad gauge) from foot of Market street (via Niles), or from Third and Townsend streets, arriving at San Jose shortly before 10 o'clock on Saturday morning. They will be met at the station by stages. The start from San Jose will be made promptly at 10 o'clock, in order to arrive at Smith Creek about half-past one. Here dinner will be had, and by starting promptly the summit can be reached about 4 o'clock. A meeting of the Board of Directors will be held in the library immediately on arrival, and as soon thereafter as may be, the meeting of the society will be called to order. The observing-rooms are not open till 7 P. M., and the time after adjournment until then can be well utilized by taking a short walk to one of the neighboring summits, from which magnificent views of the valley can be had.

At 7 P. M. the domes of the 12-inch and 36-inch equatorials are opened, and all visitors take their turns in looking at the most interesting celestial objects which are in a convenient situation. About 10 P. M. the visitors leave, and the members of the society will then have a further opportunity of seeing other heavenly bodies. As many of the members as can be accommodated by the astronomers resident at Mt. Hamilton will be personally invited to spend the night on the summit. The others must return to Smith Creek hotel in the stages, which will leave the summit about 11:30 P. M. At the hotel, rooms will be ready for members of the society. The stages returning to San Jose leave Smith Creek about 8 A. M. and 1 P. M., in time to connect with the various trains to San Francisco.

Nicaragua Ship Canal.

As long ago as 1528 there was talk of a canal across the Isthmus of Panama, and a route by way of Nicaragua was suggested in 1551 by a Spaniard named Gomara. In 1825 the Central American Republic sought the co-operation of the United States in building a canal via Nicaragua, and a contract was made, but the necessary capital was not supplied. The more recent project, elaborated by A. G. Menocal of the U. S. Navy, was based on surveys made in 1872-73 at the expense of the U. S. Government.

The proposed route extends from the harbor of Greytown on the Caribbean sea to Brito on the Pacific. Its total length is 169.8 miles, of which 38.98 miles will be excavated canal, and 130.82 miles' navigation by Lake Nicaragua, the river San Juan (the outlet of the lake), the basin of the river San Francisco, and through seven locks. A canal without locks is impracticable across Nicaragua, and one with locks must necessarily have the lake for its summit level. This inland sea is about 90 miles long and from 35 to 45 miles wide. It is about 110 feet above sea-level. The lake will be connected with the Pacific by a canal, with the Atlantic by slack-water navigation in the river San Juan, and by a short section of canal from the river San Juan to the basin of the river San Francisco, and navigation through this basin by a canal from the eastern end of that basin to the Caribbean sea.

The report of the U. S. surveying party under Engineer Menocal is one of great general interest. Besides the maps and sections, it is accompanied by many views of that part of the world, one of which, Corinto harbor, is given on page 221. In January, 1885, when Mr. Menocal was there, there were 13 vessels in this harbor loading with dye-woods and coffee, destined mostly for Europe via Cape Horn.

EDISON, the American inventor, is being lionized whenever he goes in France and Germany.

Construction of Maps in Relief.

Continuing this subject from last week's PRESS, the following method is given of making the casts when the modeler desires to do so. Inclose the relief in a wood frame, oiled or soaped to prevent the adhesion of the plaster, and place the whole on a flat surface to secure an even distribution of the liquid mass when poured into the mold. A sufficient quantity of water is then taken in a suitable vessel, into which plaster of Paris is carefully sifted through a fine-mesh sieve, rapidly stirring to prevent the formation of lumps and air-bubbles in the mixture. When it arrives at the consistency of cream, it should be poured into the mold and allowed to stand until partially set. A straight edge should then be drawn across the top of the frame to remove the surplus plaster level with its upper edge. Large casts may be strengthened with iron rods or with wire netting inserted soon after the plaster is poured into the mold; and the weight of a thick cast may be reduced by hollowing out the plaster from the under side before it gets thoroughly hard. In a short time the plaster will be sufficiently hard to turn over, when the frame may be removed and the wax original separated from the cast. The writers prefer to dry the mold after retouching and to apply a coat of thin shellac varnish to the plaster negative before casting a positive. When time is an element, a positive may be made immediately by brushing the mold with a solution of soap-water before casting.

The finish of a model depends on the purpose for which it is to be used. For photographic prints or photo-mechanical reproduction, the surface features can be put directly upon the plaster in black, india-ink, or paint.

Fig. 6 is a relief of the western end of the Northern anthracite coal-field, prepared in india-ink for photo-mechanical printing by the Ives process. If it is desired to color the model geologically or otherwise, a thin coat of shellac varnish is applied, and it may then be colored in oil. The artistic map-maker will have no difficulty in giving character and finish to his cast, but unskillful drawing and poor lettering will ruin the appearance of otherwise good work.

The use of contour curves to delineate underground topography originated with Mr. B. S. Lyman about 1865, and the first model based on his map was made to illustrate the complicated structure of the Cooper or Bennett coal-beds at the Hutchinson mine of the Plymouth Coal Company, Plymouth, Luzerne county, Pa.

The method of modeling last described is admirably adapted for the construction of underground relief; and a plate showing, on this plan, the workings in the middle member of the Mammoth coal-bed at Excelsior colliery, Columbia county, Pa., is given in Fig. 7.

There is great diversity of opinion in regard to the relative scale admissible in the construction of relief maps, though the weight of opinion seems to be in favor of a slightly exaggerated scale.

The writers have avoided in their practice the distortion of the vertical, where possible, and believe it to be unnecessary in maps of large scale, say of 100 to 1000 feet to one inch, depending somewhat on the nature of the topography. Fig. 8 exhibits a piece of the South Mountain, Pa., constructed on the true scale, vertical and horizontal alike from map, Fig. 1 (last week), where the greatest elevation is 1000 feet. Fig. 9 shows the same territory with the vertical scale increased from 2 to 1.

Prof. J. P. Lesley does not believe in exaggerated reliefs. He says: "In 1865 I made a model of the underground of the Plymouth anthracite mine, with its remarkable vertical fault, from levels which I took in the mine. What good would this have been had I used a different vertical scale?

"I have myself made models on several plans; the most satisfactory, but the most laborious, being to draw a good many cross-sections on the same vertical and horizontal scale, along parallel lines, as nearly as possible at right angles to the general strike; then cut strips of wood, lead, zinc, or stiff paper (I have used all four) to represent the cross-sections; set these up in their places, fill in with wax or plaster, and finally tool the surface thus obtained. I prefer this method to the common one of jigging out the contour curves and filling the terraces between them with slopes of wax. The latter method is easier and less costly; but it is sure to make the modeler slovenly in his geological representation, and it is a powerful seduction toward exaggeration of the vertical scale. Beginners and earnest scholars ought not to be allowed to use this method until they have been drilled to accuracy and to love the true natural aspect by the compulsion of the method of cross-sections."

Fig. 6.—MODEL PREPARED FOR PHOTO-MECHANICAL PRINTING.

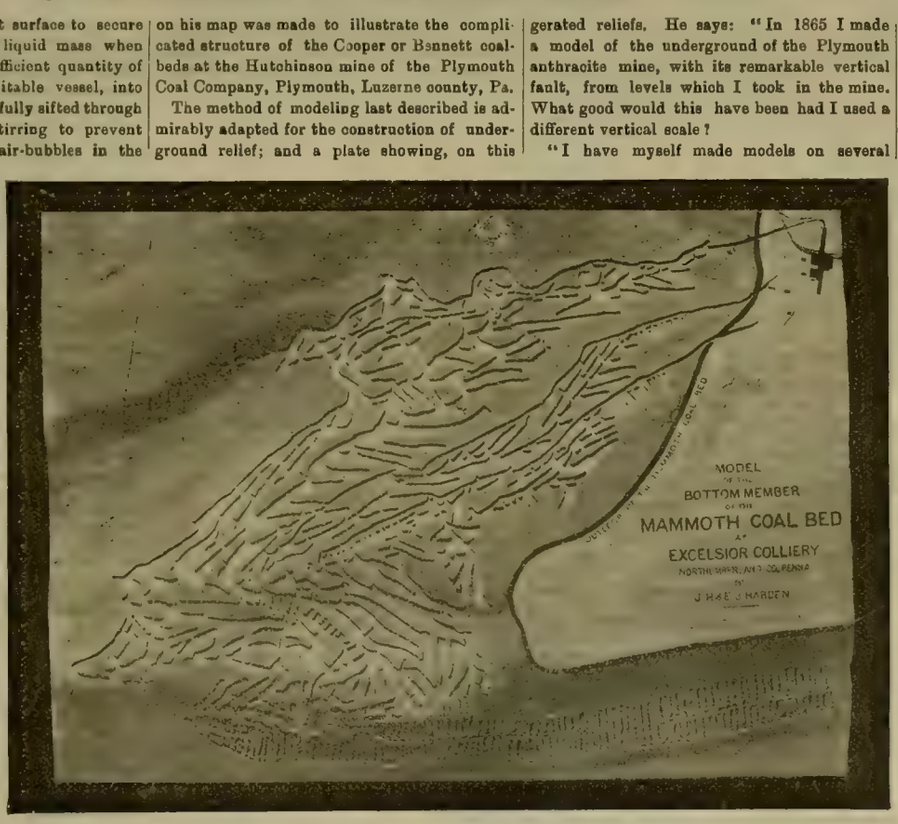

Fig 7.—MODEL OF AN ANTHRACITE COAL MINE.

Probably one of the largest relief-maps or models ever made was of the earth, 60 feet in diameter, covering 10,000 feet of surface and exhibited by Mr. Wyld in Leicester Square, London, in 1851. The horizontal scale was 10 miles, the vertical 1 mile to 1 inch. The view was taken from the interior, the delineation being on the concave instead of the convex surface. There was no writing upon the model; the sea was colored blue, and the land of as natural a tint as possible.

Lieutenant H. A. Reed, in his work on topographical drawing, recommends the following exaggeration as affording a pleasing relief: "For a map scale 6 inches to 1 mile; if mountainous, $\frac{1}{3}$; if only hilly, $\frac{1}{2}$; if gently undulating, $\frac{2}{3}$. For smaller scales, except for very rugged tracts, the exaggeration should be correspondingly increased. For a tract consisting wholly of mountains, no exaggeration is necessary."

The importance of relief maps for educational purposes was shown at the exhibition of appliances used in geographical education, held by the Royal Geographical Society of Great Britain, in December, 1885, when a large number of such maps were exhibited by the various countries of Europe.

It is desirable that a cheaper method of duplicating models be found; and experiments are being made by the writers (J. H. & E. B. Harden) toward this end. Plaster of Paris is for many reasons a good material; but its weight and its liability to damage in transportation render it unsuited. Paper seems to be best adapted to meet the requirements of the case.

Preserving Piles.

The Anderson and Elias Covering.

A great many chemical pile-preserving compounds have been tried to prevent the attacks of the teredo and limnoria on the submerged timbers of wharves. It has remained, however, for a California inventor to perfect a mechanical method of preventing the ravages of these troublesome pests. This consists of a metallic jacket perfectly surrounding the pile from the surface of the mud to high-water mark.

This jacket is formed of the rustless steel manufactured by the Pittsburg Rustless Iron Works and does not corrode in salt water, but will last an indefinite period. The steel jacket consists of two flanged segments and drawn together by bolts and rivets through the flanges. It is claimed that an eighth-inch pile after being encased by the steel shell is as strong as a common 12 inch pile, and a saving of 20 per cent in piles can be effected by using the jacketed piler, the flange on each side acting the same as T-iron for support. We gave engravings of the system of protecting piles in the MINING AND SCIENTIFIC PRESS of Dec. 15, 1888.

One thing claimed by the patentees of this pile covering is, that the steel sheathing makes the piles stronger, and for that reason they may be placed farther apart when building a wharf. In other words, it requires but 800 piles with this covering, to do the work of 1000 unprotected piles. The piles are prepared and covered before being driven into place.

There is no danger in driving the prepared pile of loosening any part of the covering, as

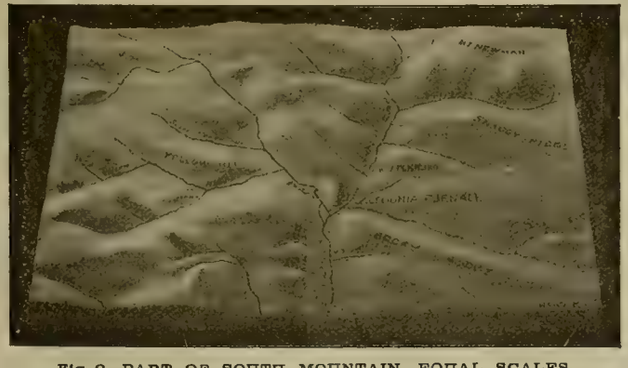

Fig. 8.—PART OF SOUTH MOUNTAIN, EQUAL SCALES.

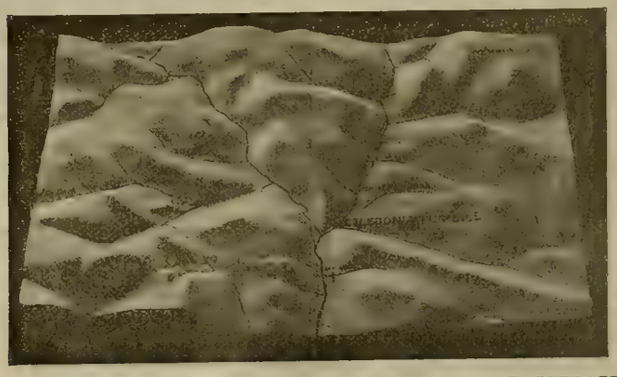

Fig. 9.—PART OF SOUTH MOUNTAIN, VERTICAL SCALE EXAGGERATED.

the covering has flanges with holes in it to receive rivets every 2½ inches apart. The pile is turned in a lathe and properly smoothed down to a straight line, and after that covered with hot coal tar mixed with asphaltum. The jacket is then riveted firmly around the pile, which makes it perfectly water-tight underneath the jacket. There is no danger to the covering after the pile has been driven from the jarring of the wharf, which is always in motion, especially during stormy weather, when ships are moored to wharves, as the spring of the pile will be between the jacket and the mud.

A machine is now in process of construction at the Atlas Iron Works (J. B. Jardine, proprietor), for the purpose of turning the piles which are to receive the jacket of the rustless steel, 30 tons of which are now on the way from Pittsburg, Penn. The whole plant will be placed on some portion of the water-front.

A very strong company, called the Anderson & Elias Teredo-Proof Pile Co., has been organized in this city with a capital stock of $1,000,000, in 100,000 shares. The corporation has been organized to build wharves and piers, using this patent, and all who are desirous of gaining any information regarding the above can do so at the office of the company, room No. 6, Hansford Block, 132 Market street, the officers being Henry Anderson, general manager, and L. H. Anderson, secretary.

The International Monetary Congress.

That the advocates of bimetallism are gaining in numbers is witnessed by pronounced organs of monometallism not being so outspoken in their views, and covertly admitting that bimetallism may possess more merit than heretofore given credit. The advocates of bimetallic currency appear only too desirous to secure discussion on the subject, well knowing that, free from prejudices and placed on the broad plane of commercial and financial advantages, their views will win recognition. Believing fully in this, the representatives in France of the double standard metallic currency arranged in conformity to the French Ministerial decree of Dec. 6, 1888, for a Monetary Congress connected with the Paris Exposition. To this Congress were invited leading representative writers and speakers on monetary subjects both in the Old and New World, but chiefly from among those who have won recognition in Europe.

Paris cablegrams received last week announced that the Monetary Congress was convened on September 11, and also that there were 170 members present, including 23 representatives of European and other governments. This necessarily gives to the Congress an international character, which will give weight to its deliberations and gain for its conclusions a certain degree of recognition.

The program of the Congress is as follows:

First—Report of the Committee on Statistics named by the Committee of Organization. This committee will make a report from the latest works on the statistics of gold and silver and instruments of circulation and upon comparative monetary legislation.

Second—Inquiry into the causes of the fall in the value of silver relatively to gold. Should this fall be attributed to the increased production of the mines, or should it be attributed to the supension of the free coinage of silver in bimetallic States, or should it be attributed to these causes united?

Third—What injury do the fall of silver and the frequent fluctuations of its value relatively to gold cause to commerce in general, to industry, to agriculture and to Government finances?

Fourth—Examination of the means proposed for remedying this state of things. (*a*) Re-establishment of the former bimetallic system on a broader basis by means of an international agreement. (*b*) General adoption of the single gold standard and gradual demonetization of silver. In this eventuality, what transition measures would it be necessary to adopt?

Fifth—Advantages and disadvantages of monetary unions between various States, with reciprocal circulation. The amelioration and extensions of which such systems are susceptible.

Sixth—Maintenance of monetary circulation. Estimate of the wear and tear of coin. Influence of the wear and tear of coin on the premium paid for ingots and the rate of charges. Means of remedying it. Who ought to bear the expense of maintaining the circulation—private citizens or the State, or the group of States forming a monetary union?

Seventh—Various questions: (*a*) Inquiry into the best type for an international coin. (*b*) Observations in relation to subsidiary coins of silver, nickel and copper.

A careful reading of the program makes it quite evident that it is the intention of the promoters of the Congress to leave nothing undone by which a clearer idea of the relative standing of the single and double standard of metallic currency has in connection with the world's finance and commerce. The appointment of a statistical commission from the ablest representatives to report from the latest works on the statistics of gold and silver and instruments of circulation and upon comparative monetary circulation, shows they fully recognize what the action of the Congress should be grounded on. The following are the members of the committee: Messrs. Leon Say, president; Ad. Coste, P. Delombre, Fernand Faure, Fournier de Flaix and Alfred de Foville.

Wave Motors.

Action of Waves on Ocean Beaches.

EDITORS PRESS:—A writer in a journal in this city criticises the wave motor which I have constructed near the Cliff House in the following manner:

"We have recently examined this apparatus, not so much with a view to learning anything respecting 'wave force,' but as a matter of curiosity. A wooden truss frame is thrown across a notch in the cliff, resting on the rock at each side. A large pendulum with a vane at the bottom is swung beneath, and from this pendulum, about one-fourth the distance down from the center of suspension, links extend back, connecting with a cross-head and directly to the ram of a pump, which is supposed to force salt water up through a pipe of six or eight inches bore to the hill above.

"After a bird's eye view of the 'plant' below, we went up to the end of the pipe to see the discharge, but our climb there was like the young man from New York whom Mark Twain describes as sitting on the banks of a pool in Palestine waiting for a 'turtle to sing.' The song there, like the water here, was wanting, and our reflections sitting there on the sand were something as follows:

"The pendulous action of waves has tremendous force in a vertical direction, in acting on buoyant bodies, but horizontally nothing, or next to nothing, except the wash at the shore where the motion is broken up. Waves do not advance as is commonly supposed, that is, the water itself does not advance, merely rises and falls, and no horizontal force worth considering can be obtained. * * * As before remarked, and as must be obvious, there is no horizontal movement of the water except the 'swash' at the shore, where the pendulous or oscillating motion is arrested, and it seems to us, aside from the maintenance of a plant, the better way to utilize wave force is vertically.

"The force of waves, that is, the force of broken waves impelled by the wind, may exert a force of one ton for each foot of opposed surface, but the blow is sudden, and from the nature of the circumstances scarcely available for motive-power. In the first place, no plant not enormously expensive could be constructed to withstand the breaking force of waves at the shore. This we see illustrated in the case of vessels. So long as they have sea room they will ride out a gale, rising and falling with the seas, but as soon as driven ashore a vessel becomes fixed and does not yield, and if exposed to the force of breaking waves is destroyed."

This writer's examination appears to have been about as complete as his judgment, as he did not wish to learn anything, not even the fact that the pump was disconnected from the motor. A discharge of water could scarcely have been expected at that time, at the *upper* end of the pipe.

When preparing to build the motor at Point Lobos, I found that rocks of three tons weight were thrown by the waves or surf 100 feet to the inner end of the chasm and there ground to pieces. Was not power required to do that?

There was a cave at the end of the chasm into which the surf rushed, compressing the air to such an extent that when the wave receded, the water was often thrown more than 90 feet high, indicating *some power*. When a wave strikes a solid, a portion of the water is thrown into the air, the distance depending upon the shape of the object and the force or power of the wave, in some cases more than 180 feet high. [See Stevenson on Harbors.] Also, go to Point Lobos almost any day for smaller exhibitions. As there is force and motion, there is power.

Mr. Thomas Stevenson, to whom the above writer refers, "found the average horizontal force of the waves in the Atlantic ocean (not Pacific) to be 611 pounds per square foot in summer, and 2086 pounds in winter."

He states also that "the enormous mechanical power of the waves is in a *horizontal* direction." * * * "That the force of the waves moved a rock of 19½ tons weight, 50 feet above high water;" that the same force quarried a rock of 5½ tons, from a bed 72 feet above high water. * * * That at the Wick harbor works a section of the breakwater weighing 2600 tons was broken off and thrown over into the harbor.

He also states "*the action of a wave, therefore, is not momentarily, as in the case of a solid, but is continuous.*" * * * The italics are his. [See his work on "Harbors," 3d edition, chapter IV.]

I found there was power when I connected the pump to the motor and discharged the water with a pressure of 220 pounds to the square inch—a load of more than 12 tons and a *movement* of 46 feet of the motor. I could see no difference in the length of stroke when the load was on or off.

There is an average of about four waves per minute, with a force varying from 400 pounds to 6000 pounds per square foot (generally about 1800 pounds), 60 feet off the rocks at Point Lobos, and with my double-dash motor I can get an average of more than 30-foot stroke.

Dash plates 25 feet long by 8 feet high will transmit an average of about 500-horse power to the pumps; and this with a minimum risk, as all parts of the plant are round except the dash plates, which go with the sea and swing up so as to allow the water to pass under, unlike floats which must be anchored in deep water, so that they may not strike the bottom, and must be held against the full force of the waves. Besides, there must be means of holding the pumps to the bottom of the sea and transmitting the power to the shore, which, unlike my motor, "would be enormously expensive."

The motor at Point Lobos was built three years ago, and has been running all the time since, except when injured by rocks thrown down by the explosion of 80,000 pounds of dynamite on board of the schooner Parallel, and when I was making experiments. The waves have never injured it, although it is principally wood, and waves have sometimes come over the pump seven feet deep, and the pump is 26 feet above low water. From my experience I am fully convinced that with my improved wave motors we can supply this city with all the power and salt water that may be required for all purposes at a moderate cost. All engineers are welcome to examine my plans. E. T. STEEN.

San Francisco, Sept. 17, '89.

THE WATCHMAKER.

Electric Clocks and Watches.

Mr. Emil G. Hammer of Brooklyn, N. Y., is the patentee of an electric clock which has novel and peculiar features embodied in its construction that make it noteworthy. The time is indicated by means of revolving disks, bearing the figures denoting the hours and minutes, instead of by hands turning around a dial. There are three dials, the first moving every minute, the second every ten seconds, and the third every hour. This dial apparatus is to be connected through the medium of an electric circuit with a standard regulator, which acts to close and break the circuit once each minute, or any other desired interval of time, thereby transmitting an electric impulse which excites an electro-magnet and causes it to set in motion the mechanism by which the dials are turned.

The figures upon the dial faces appear to the observer at an opening in the face, so as to read in their proper consecutive order, and with the most unmistakable distinctness. This arrangement makes it very valuable for railway depots, offices, etc. One particular advantage of this arrangement is that the time is positively indicated by the figures at the dial openings, no matter if viewed from an oblique position. In ordinary dials, the observer standing much below the dial face will not see the correct range of the index hands, and may be misled several minutes. The actuating mechanism is such as to insure great durability and steadiness of action.

M. L. Hussey of Menlo Park, N. J., has also secured patents for both a watch and a clock to run by electricity. He has organized a company to manufacture his clocks and watches. Mr. Hussey has been 11 years at work on his inventions, and has secured patents on 13 appliances necessary in the manufacture. The peculiarity about timepieces is the gravity movement, which, aided by a small electric current, moves the pendulums of the clocks and the large balance-wheel of the watches. The battery is inclosed in the watchcase, and with it the timepiece will run for a whole year without any attention. In time it is expected that five-year watches and clocks can be manufactured. The new watches and clocks contain only one-third as many parts as the ordinary instrument.

MODERN WATCH DIALS.—Watch dials are now made by photography at a mere fraction of their former cost. They all used to be painted by hand. Now a hundred are made in the time formerly required to produce one, and each of the hundred is better than the one would have been. The dial is of copper, covered with enamel. Upon that they lay a sensitized coating of albumen and bichromate of potash. A large drawing, say 12 inches in diameter, of the design, figures, and dots that it is desired to put upon the dial, is photographed down to the required size, which makes it so very fine that whatever inaccuracies may have been in the drawing are almost beyond discovery by the microscope. The negative thus made is exposed to the light, in contact with the gelatine-coated watch dial, from three to five minutes. Electric light is just as good as sunlight. Where the light has acted, the gelatine is made insoluble. The dial is now inked over with common lithographic transfer ink. Next, with a clean sponge, moistened with a little gum-water, the ink and gelatine are wiped off the dial from all parts except where the light has acted, and to those it adheres, leaving the design in clear black upon the enameled plate. But that design would easily blur and rub off by wear. Another process is necessary to make it permanent. A metallic enamel powder of any color desired — black, blue, red, green, or purple—is dusted upon the dial. It sticks to the inked portions, but nowhere else. Then the dial is put in the muffle and fired. The enamel powder melts into the white enamel base, and the work is complete. The Waltham Watch Co. paid $2000 for that process. By it they can turn out, for ten cents each, dials that in the old way of making would have cost one dollar apiece.

WATCH JEWELS.—You often hear the owner of a valuable watch say that he is afraid to send it to be repaired for fear that the workman might steal the jewels and replace them with common pivots. This is one of the popular fallacies. Watch jewels are practically valueless and it is only the labor of setting them that gives any extra value to a jeweled watch. They are made by machinery from the chips broken off stones in cutting and can be bought at jeweler's supply stores for less than a dollar a dozen. But to get a new jewel put in a watch costs considerable money. Suppose a fine ruby jewel is needed. The watchmaker has to go to the supply store and spend perhaps an hour in hunting among quarts of little stones for one that is the exact size and shape required. When he has found what he wants he will have to pay 25 cents for it, not that it is worth so much, but because the dealer does not care to go to the trouble of setting out all his jewel-boxes for a smaller sum. It will then take the workman a couple of hours to set the jewel in place because he has to take the watch to pieces and clean it before he can put in the jewel. To steal a jewel from a watch would cost a workman more than a dollar's worth of labor, which would be rather a high price to pay for a chip of stone worth eight cents. The common watch jewels are made from chips of garnet, amethyst or topaz, while the best are made from chips of ruby. Sometimes people talk about having a fine mainspring replaced by a cheap one. Such a trick would result in even greater loss to the thief than taking out jewels. Mainsprings are worth about a dollar a dozen. The best American spring made is the Howard and they sell singly for 40 cents.

A CLOCK TO DATE LETTERS.—The electric date and time stamp is the latest thing in inventions. It may be attached to any clock, and in connection with a battery will register the exact time of the day to a minute, and also the day of the month. There is no kind of office business in which this instrument will not be useful as a time and labor-saver, and valuable as a protection against mistakes, disputes and impositions. It may be used to date correspondence without the trouble of referring to a calendar; also to record the time letters or telegrams are received and answered, the time orders are received and filed, goods shipped or bills paid; also to record the time employes start and leave off work, and registering the time watchmen visit the different parts of an establishment. The stamp is operated automatically in synchronism with any clock by means of an electric battery and circuit closer attached to the clock. In addition to the date the stamp may be made to give also the name and business address of the owner or any other words desired, such as "received," "filed," "canceled." —*Jewelers' Weekly.*

HOW TO SPOIL A WATCH.—If you are going out on the electric railway, says the Washington *Post*, you had better leave your $600 chronometer at home, and carry a Waterbury, for there is so much electricity around that it is apt to magnetize your watch. Many people complain that their valuable watches have been rendered useless by riding on the Eckington line. This is something that can hardly be averted. Electricity will escape. It isn't like a bulldog, which can be chained up and tagged. Invisible and imponderable, it makes its way from the wires which conduct it into the very air itself and the delicately constructed steel wheels of a watch catch it up. Then the cogs and pinions are held back by its subtile force until the value of the watch attacked as a timekeeper is destroyed. There are some non-magnetic watches made now which seem proof against such dangers, and non magnetic cases are also put out, which prove equally serviceable. But it is well to observe the precaution not only on the electric railroads, but when near the dynamos of an electric-light plant.

WATCH FACTORIES.—The watch factories in the United States have prospered beyond measure. In achieving their deserved prosperity, the Elgin and other standard corporations have made it possible for every workingman in the country to wear a good timekeeper at a lower price than watches were ever before made for in America. High-priced foreign watches are now principally used in the United States for presentation purposes. The ordinary citizen finds the American brands good enough.

CLOCKS AND WATCHES IN ENGLAND.—During the last ten years a complete revolution has been effected in England by the application of the American machine and factory system to the production of watches. This has been done without depreciating in any way the high character which English horological work has always held, while the prices of English lever watches and chronometers have naturally changed in the face of American and Swiss competition.

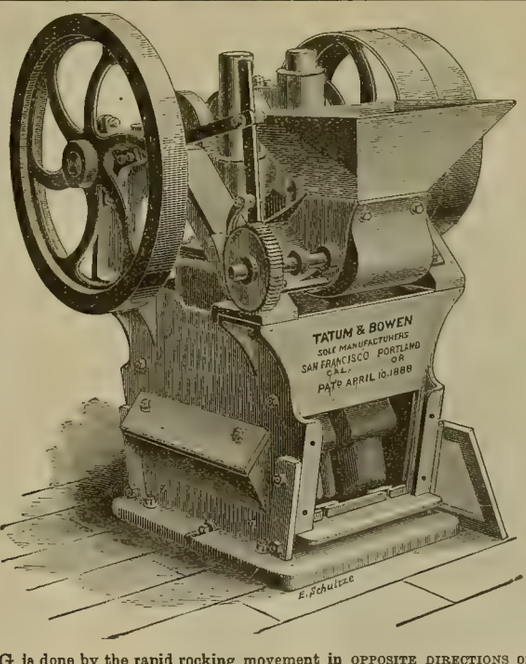
—THE—
JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.
The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

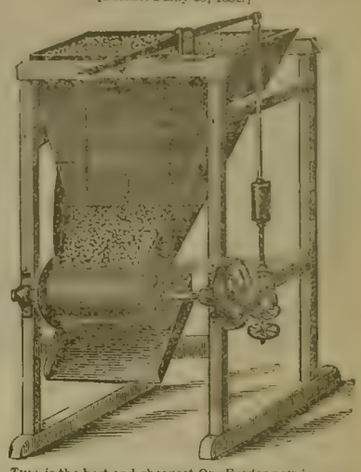
N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE
"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

—THE—
PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective
Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.



The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an
IMPROVED ROCK BREAKER.
Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

TATUM & BOWEN,
34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,
AND PORTLAND, OREGON.
MANUFACTURERS OF MINING AND SAW MILL MACHINERY.

THE ROLLER ORE FEEDER
(Patented May 28, 1889.)

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WATER-FILTER.—Orestes Pierce, S. F. No. 410,767. Dated Sept. 10, 1889. This filter is specially applicable for cleaning water in large quantities and under such conditions as are found necessary for public water-works. Water which is supplied to cities in large quantities from reservoirs often contains much foreign matter held in suspension, which it is desirable to remove before the water is delivered into the distributing pipes, and for this purpose screens of fine muslin may be employed, the water passing through them until the collection of foreign matter necessitates their being taken out and cleaned. If the water is allowed to flow through them with any considerable current the foreign matter becomes forced into the substance of the screen, so that it is difficult to clean it without a brush. In this invention Mr. Pierce interposes a dam or check between the screens and the discharge, of such a hight as to produce nearly dead water in the screen chamber, and the inflow and outflow of the water will be so gentle as to prevent any rush or perceptible current against the screens. It is thus possible to use many successive screens or thicknesses without clogging. The filter is so arranged as to provide a large filtering surface while occupying a very small superficial area, and by the arrangement of the filters the water passes through them with the least possible current, so that the foreign matter may be easily washed from the surface whenever it has collected sufficiently to prevent a free passage of the water. In making this filter the unit is a single cylinder, the surface of which is covered with a filtering material. As many of the cylinders may be set into a single tank or receptacle as desired, or each of them may be set in a separate vessel, as, for instance, a common cask.

EXERCISING DEVICE FOR MUSICIANS.—Eugene S. Bonelli, S. F. No. 410,748. Dated Sept. 10, 1889. This invention relates to certain improvements in devices for exercising and strengthening the muscles of the fingers and wrists of piano-players and musicians. For the purpose of training the muscles which are brought into action in piano-playing, an apparatus has been devised by the use of which the various muscles of the hand and wrist are strengthened systematically for the purpose of improving the technique in piano-playing. This invention is designed to improve this apparatus by providing certain rests for those fingers which are not being used, and adjustments by which the amount of power or pressure brought upon each muscle may be delicately graduated.

CUT-OFF VALVE GEAR FOR ENGINES.—Isaac F. Thompson, S. F. No. 410,775. Dated Sept. 10, 1889. This patent covers improvements in reciprocating piston engines with sliding or piston valves. The whole of the cut-off mechanism is exceedingly simple and sensitive, and its range is from nothing to the full stroke of the piston. A large engine of this pattern has recently been put at work in the Miners and Golden State Iron Works in this city, where it was made. One is also in operation at the Mechanics' Institute Fair, where it is attracting considerable attention. We shall shortly give a detailed illustrated description of this new engine in the PRESS.

SOLDERING MACHINE.—A. W. Livingston and George Wilcox, S. F. No. 410,761. Dated Sept. 10, 1889. This is a machine for soldering the ends of square or rectangular shaped metallic cans. The soldering machine is an automatic one in which an endless carrier-chain, moved by sprocket-wheels and provided with hinged plates, receives the cans to be operated on and carries them along with it through a trough of molten solder, at the same time revolving the cans over and over, thus bringing every side of the end of the can in contact with the molten solder, and finally depositing them on end on a table or conveyor, out of contact with the machine, to cool off.

GRAIN SEPARATOR.—H. O. Triplett, Orland, Cal. No. 410,776. This patent covers certain improvements in apparatus for separating grain from the straw and chaff with which it is mixed when it leaves the thrashing cylinder. In this machine the front end of the shoe is not so heavily loaded with grain and chaff as in the ordinary operation of cleaning, and this admits of a lighter blast through the screen than would otherwise be the case. By reason of a double blast this invention is enabled to distribute and separate the material which is flowing from the grain-carrier, so that none of the grain is blown from the rear end and lost as is often the case. There are several other improvements in this device which can be easily applied to any separator or thrashing machine of the ordinary construction with a little additional change.

Mining Personals.

J. H. Kincaid is superintendent of the North Occidental mine on the Comstock.

Richard De Kuhn is superintendent of the Mocking Bird mine and mill near Prescott, A.T.

J. A. Ferson is superintendent of the Union copper mine, Copperopolis, Calaveras county.

W. B. King of the Owens mine, Julian district, San Diego county, is visiting in Oakland.

Superintendent A. C. Hamilton of the Chollar and Potosi came down to San Francisco last week.

Jesse Prichard of Denver has been employed to take charge of the Grand Tower group of mines at Gold Hill, N. M.

Robt. Beveridge, formerly of the Hope mill, Montana, is now in South America in the employ of Fraser & Chalmers.

James H. Crossman, one of the field assistants of State Mineralogist Irelan, will shortly start on a tour of inspection in San Bernardino county.

A. S. Burt has been elected superintendent of the Eureka Con. mine, Nevada, to fill the vacancy caused by the resignation of Hank Donnelly.

F. Chappellet, who has managed the Dardanelles mine, Placer county, for nearly 13 years so successfully, thinks of taking a needed rest as soon as a man can be found to take his place.

D. D. Bailey, Recorder of Julian district, San Diego county, has appointed Joseph Marke of Julian, and R. G. Melrose of the Gold King mine, deputies.

James D. Hague, president of the North Star Gold Mining Company, of Grass Valley, is authority for the statement that the gross value of the product of the mine in July was $21,219.44, and in August $27,400, and he intimates that another dividend of $50,000 will soon be paid.

H. S. Sherard, formerly superintendent of the Vulture mine in Arizona, has become interested in mining property at Gold Hill, N. M. He has recently returned from Lower California and tells the Silver City *Enterprise* that he objects to mining in that country for the reason that the superintendent is always held personally responsible for all debts or accidents. If the company fails to pay, the superintendent is locked up and held until the funds are forthcoming. While this is hard on the superintendent, it is a splendid protection to the miner.

SILVER-LEAD ORES.—Telegraphic reports received by the Treasury Department from the collectors of customs at El Paso, Laredo and Eagle Pass show that the quantity of silver-lead ores imported since the enforcement of the regulations of July 18th last was 10,898 tons, while the importations for the like period immediately preceding the issuance of such regulations were more than one-half again the volume of importations. The reports also show that the value of the ores imported at Laredo prior to the adoption of the new regulations was much lower than that since imported, indicating that large quantities of low-grade ores formerly permitted to come in free are now excluded.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
W. W. THEOBALDS—Central California.
GEO. WILSON—Sacramento Co.
E. H. SCHAEFFLE—El Dorado and Placer Cos.
DR. W. F. DRAKE—Sonora, Cal.
FRANK S. CHAPIN—Lassen Co.
SMITH MCMULLIN—Humboldt Co.
A. F. JEWETT—Tulare Co.
ROBERT M. MAPPES—Fresno Co.
E. L. RICHARDS—San Diego Co.
JULES BAUMANN—Arizona.
H. G. PARSONS—Nevada.
WM. H. HILLEARY—Oregon.
F. C. ROBERTSON—Oregon and Washington.
W. B. FROST—Utah.

THE Portland *Oregonian* says the value of the manufactures of that city for 1889 will be $18,000,000, while the capital invested amounts to $12,000,000.

COKE.—The smelting companies of Eastern Nevada, says the *Enterprise*, should now be able to procure coke at considerable lower rates than in former times when it was necessary to bring that article from the East. They are now producing coke of good quality in Utah, and also in Montana. Some claim that the coke made in Montana is even better than the Eastern article. Cheap coke would bring to the front many mines now languishing in various sections of the eastern part of Nevada.

HYDROMETALLURGY OF SILVER.—Before the Academy of Sciences last Monday evening, Frederick Gutzkow, mining engineer, made an address upon the hydrometallurgy of silver, giving practical working illustrations of what is known as the wet process of treating ores. He dwelt upon the many improvements and discoveries which have been made in this process in the past few years and the great possibilities for the economical extraction of metals which it offers.

INFORMATION has been received that the Grand Prix and gold medal had been awarded at the Paris Exposition to Prof. Rowland of Johns Hopkins University for his photographic map of the solar spectrum and his concave gratings. This is in addition to the Grand Prix and medal awarded to Johns Hopkins University for its publication.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company—Location of principal place of business, San Francisco, Cal. Location of works, Placer County, Cal.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment (No. 14) levied on the 13th day of August, 1889, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 13th day of August, 1889, so many shares of each parcel of such Stock as may be necessary, will be sold at public auction, at the office of the Company, 303 California Street, room 11, San Francisco, California, on TUESDAY, THE EIGHTH DAY OF OCTOBER, 1889, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, 303 California Street, room 11, San Francisco, California.

ASSESSMENT NOTICE.

California & Nevada Railroad Company.—Location of principal place of business, San Francisco, California. Location of Railroad, Alameda County, California.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1889, an assessment, No. 1, of Fifty Cents per share was levied upon the Capital Stock of the corporation, payable immediately in United States Gold Coin to the Secretary at the office of the Company, Room 12, No. 320 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of September, 1889, will be delinquent and advertised of sale at public auction, and unless payment is made before, will be sold on Monday, October 14th, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. A. PHELPS, Secretary.

Office, Room 12, No. 320 California Street, San Francisco, California.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying at leading precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the student nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications, "Testing and Working Silver Ores," "Leaching Gold and Silver Ores" that have been "successfully popular" is written in a condensed form, which renders the information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge, Mixing and Charging; Assay Litharge, Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation, To Find the Value of a Specimen; Tests for Ores, A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

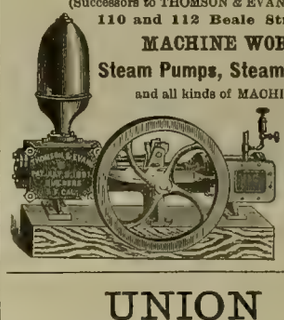
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:



Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S.F.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

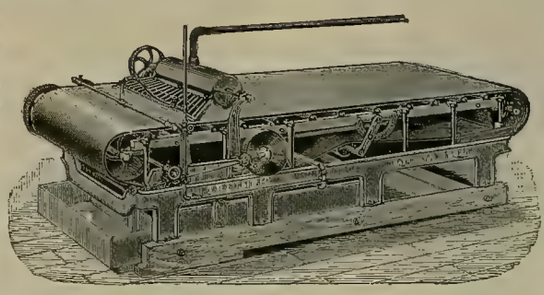
There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.



The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Emipre Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanner or concentrating devices. DAVID MCKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of **LATEST DESIGN** and **MOST IMPROVED** construction. We offer our customers the **BEST RESULTS OF 38 YEARS' EXPERIENCE** in this **SPECIAL LINE** of work, and are **PREPARED** to furnish the **MOST APPROVED** character of **MINING AND REDUCTION MACHINERY,** adapted to all grades of ores and **SUPERIOR** to that of any other make, at the **LOWEST POSSIBLE PRICES.**

We are also prepared to **CONSTRUCT** and **DELIVER** in **COMPLETE RUNNING ORDER,** in any locality, **MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC.,** of any **DESIRED CAPACITY.**

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1862

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for th most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt,
Mining Engineers and Metallurgists

J. KUSTEL. H. KUSTEL.

METALLURGICAL WORKS.

318 Pine St. (Basement,
Corner of Leidesdorff Street, - - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.
Assaying and Analysis of Ores, Minerals and Waters.
Mines Examined and Reported on.
Practical Instruction given in Treating Ores by improved processes.

G. KUSTEL & CO.,
Mining Engineers and Metallurgists.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 19, 1889.

There was a slight gain in general trade the past week. The Mechanics' Fair is drawing quite a number of merchants to this city, who take advantage of their visit to buy goods. Iron-workers report more orders and fairly active times. General manufacturers report good orders, which necessitate running on full time. Remittances from the interior are increasing, while the coin going out shows a slight falling off. The amount of gold received from Australia was a little over $500,000, with other shipments to follow. In the local market money is easy, with no particular demand outside of harvest wants. Considerable money is being put out on realty in this city.

MEXICAN DOLLARS—There has been a quiet but good demand for Mexican dollars for shipment by the next outgoing steamer for China. The prices paid ranged from 74¼ to 74½c, according to quality.

SILVER—A strengthening in sterling exchange has imparted a still stronger tone to silver by causing more buying orders. The scarcity of bullion somewhat restricts sales. The mines on this coast appear to have a less output than last year at this time. The prices paid the past week ranged from 93⅜c to 93½c, according to buyers' necessity. The market closed steady at 93⅜@93½c bid.

QUICKSILVER—Receipts the past week aggregate 255 flasks. The market is firm in sympathy with European markets. The demand is light for both home and export. The shipments overland in last month aggregated 83,250 lbs.

BORAX—Shipments overland in last month aggregated 6419 ctls. Shipments the past week aggregate as follows: For Pittsburg, 234 ctls.; New York, 649 ctls.; and Honolulu, 5 ctls. The market is very strong in sympathy with the increased strength at the East and free consumption.

LIME—Receipts the past week aggregate 6282 bbls. The market is unchanged.

CHROME ORE—A shipment of 247,520 lbs. was made to New York the past week. The market is unchanged.

TIN—Exports of plate by sea the past week aggregated 108 lbs. to Honolulu and 7525 to Victoria. The market is very strong, with buyers unable to obtain concessions for either shipment or spot.

COPPER—There was shipped the past week 725 lbs. to Honolulu. The market is reported steadier, with holders having firmer views. Consumers are taking more both in this country and abroad.

IRON—Imports the past week aggregate 100 tons of pig from Irondale. The market for spot parcels of Glengarnock, Eglinton and Clay Line White is quotable higher. The consumptive demand is increasing.

COAL—Imports the past week were as follows: From Port Townsend, 700 tons; Departure bay, 4761; Coos bay, 1470; Australia, 5685. Total, 12,626. The market is stronger and higher for prompt shipment of Australian and Scotch splint. Freights are against buyers. For spot the market is reported very strong at full figures, with dealers and consumers taking quite freely.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Sept. 18, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 9-16	93	$10 75	$4 00	$21 50
Friday	42 9-16	93	10 75	4 00	21 30
Saturday	42 9-16	93	10 75	4 00	21 30
Monday	42 9 16	93	10 75	4 00	21 40
Tuesday	42 9-16	93	11 50	3 92½	21 85
Wednesday	42½	92¾	11 00	4 00	21 75

Quicksilver advanced to 70@71c, California. The shape of the copper market is adverse to speculation. Lake quotable at 11c; electro, 10¼c; casting, 10c. Buying is limited to immediate wants. Pig lead inactive, tending lower; $3.90 bid, $4 asked. Tin has been very active, but closes more quiet.

Mining Share Market.

Reports are current of an assessment to be levied before long on Alta, Justice, Occidental, Mexican, Union, Sierra Nevada and Belcher. It is quite certain that the first three will have to levy assessments within the next 30 days, notwithstanding their crushing ore. The long-threatened 50-cent assessment on Bodie has not been levied yet, but the secretary of the company expects it any day, for winter supplies have to be laid in soon, and the company will not have $20,000 on hand at the close of this month to meet current expenses and cost of needed supplies. It is reported on the street that the Bodie stock will set back from present prices on an assessment, after which it will do better. The commission brokers report very few outside stocks carried on a margin, and as for that, very few Comstocks on a margin. The street has a deal in the outside stocks to commence in next month. Usually well-informed parties look for lower prices in the Comstocks, to be followed by quite an advance on the short interest and the uncovering of an ore body where and when least expected.

The news from the Comstock mines is now of a bearish character, as it always is when the pool is "freezing out" side holders of stock. From the outside mines our advices report that crosscutting under favorable circumstances will be commenced soon in Crocker, and also that the mill will soon be started up. From the Tuscaroras more favorable advices come to hand, as also from Eureka Consolidated and Silver King. From the Bodies we have nothing new to report.

As has been before announced in these columns, the water in the Gold Hill mines is to be pumped out, pumping to be commenced soon. In Crown Point, Belcher, Yellow Jacket, and extending farther north, a rich and large ore body is known to exist on the level from the 1200-foot down to about the 1800-foot level, but on the 2700-foot level there is nothing in Crown Point but a small but rich streak, the daily papers to the contrary. Work by the Comstock Tunnel Company looking to an extension of the tunnel west through the Savage mine will be commenced soon. Crushing of ore by the Belcher and Overman will be commenced in next month, and several of the other mines soon afterward, while Yellow Jacket will increase the ore milled double that now crushed.

Official letters received to-day (Thursday) from Bodie and Mono report that the lower levels are to be abandoned and explorations be made in the upper levels. From Crown Point the assays of ore are reported officially largely increased, being more than twice as high as the preceding week's assay. A west crosscut on the 300-foot Con. Imperial level is in 26 feet. This crosscut is considered very important. Official advices from the other Gold Hill mines are of a more encouraging character.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

PACIFIC COAST POWER CO., Sept. 14. Object, to erect and maintain pumping works and electrical plants and to sell water and electricity. Capital stock, $5,000,000. Directors—John J. Haley, J. William Lucas, J. J. Clarke, E. T. Steen, William H. Birch, F. A. Huntington and C. E. K. Royce.

GUTTER-SWEEPING MACHINE CO., Sept. 18. Capital stock, $100,000. Directors—Louis Metzger, A. E. Ball, E. A. Newland, J. R. Fritz and S. F. McDill.

CLEAR CREEK G. M. CO., Sept. 13. Capital stock, $1,500,000. Directors—C. L. Doebelin, E. A. Sparks, J. J. Atherton, Isaac Alwood, A. J. Angell, T. C. Thorm, V. G. Hush, O. J. Johnson and Geo. Jones.

THE draining of the Crown Point and Belcher down to the 2000 level will be the next movement of importance in the Gold Hill mines. The water is now flooding the 1700-level of those mines, where extensive ore reserves are located.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Sept. 11, $5350; 12, $4960; Queen of the Hills, 13, $1025; Hanauer, 15, $3750; Cons. California and Virginia, 14, $10,853; Hanauer, 17, $10,700; Mt. Diablo, 13, $8472.

LAST week's ore yield of Comstock mines aggregated 3903 tons, divided as follows: Con. Cal. and Virginia, 2695 tons, assay value $28.20 per ton; Occidental, 350 tons, assay value $17.10; Justice, 238 tons, assay value, $23 58; Alta, 220 tons; Yellow Jacket, 400 tons. The bullion yield of the above was about $95,000.

EUREKA CONSOLIDATED.—An official statement issued by the Eureka Con. Mining Co. sets forth the company's assets as exceeding the liabilities by $57 381 91. These assets consist of ore valued at $32,000, bullion valued at $11,000, coke, charcoal and other supplies valued at $28,000, and sundry other items. Bullion is now being produced with one furnace, at the rate of about $11,000 per week, which is netting the company a profit of about $10,000 per month. The reduction works, which were destroyed by fire several months ago, have been replaced at a cost not exceeding $12,000. Several new developments of ore have been made in the mine.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THERE is no statute law against hydraulic mining, and persons engaging in that class of mining are not violators of law, and are only liable for damage done to other interests, the same as in other business.

STEPS are being taken in San Jose to erect a monument to Leland Stanford, to commemorate his efforts in the cause of education in establishing the Leland Stanford, Jr., University.

THE New York Belting and Packing Co. are sending out a very useful advertising novelty in the shape of a letter and paper opener, which is light in weight and of attractive shape.

NEWSPAPER AGENTS WANTED.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 158 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & CO., S. F.

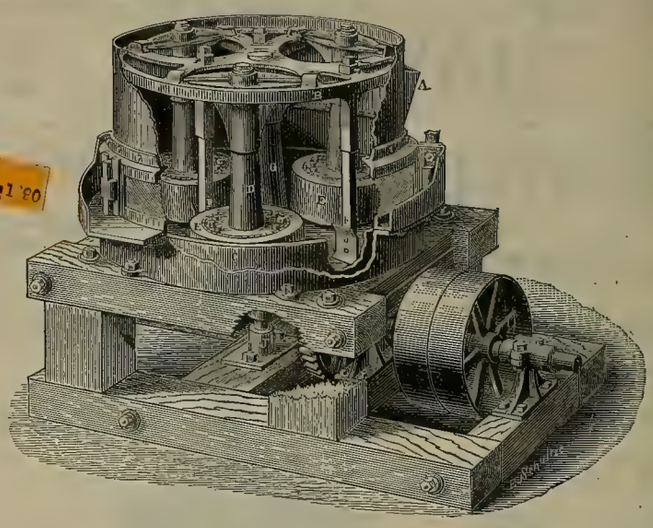
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

MINING MACHINERY.



Cal State Library 11 '90

Huntington's Improved Rock-Breaker.

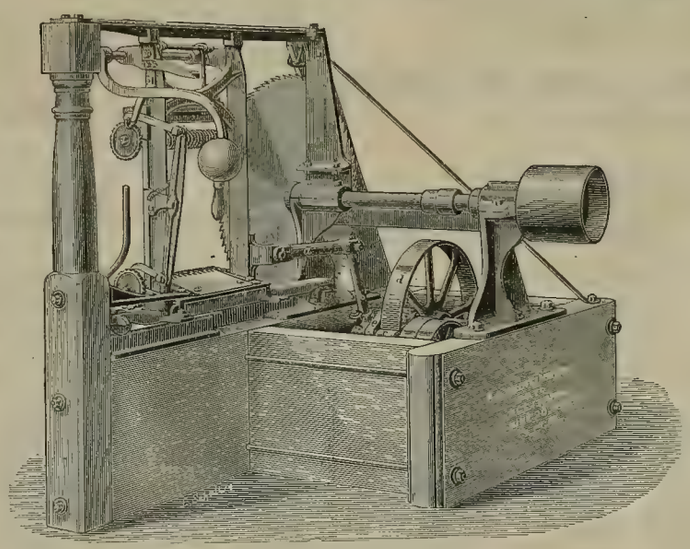
The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.



The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S
PATENT SHINGLE MACHINE.

This Machine is so well and favorably known by all the principal Lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. This feed-works is positive and uniform in its action and obviates all the jar or tremor formerly given to the machine by the weight used in the old style feed.

For simplicity, durability and rapidity of action, these machines have no equal, cutting from 50,000 to 75,500 shingles per day.

Price, complete with Jointer and one 38-inch Saw, $475.00.

The new feed-works can be applied to any of the old machines.

Price $100.

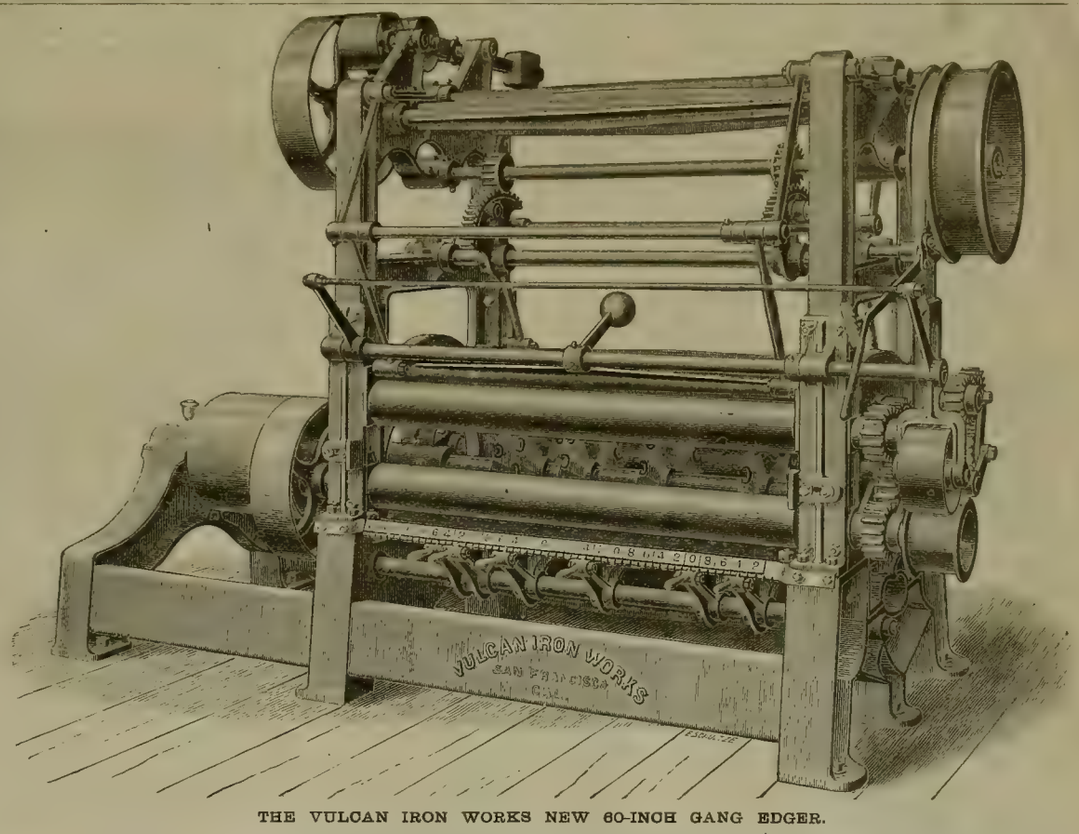
Three Dollars per Annum,
Single Copies, 10 Cts.

An Improved 60-Inch Gang Edger.

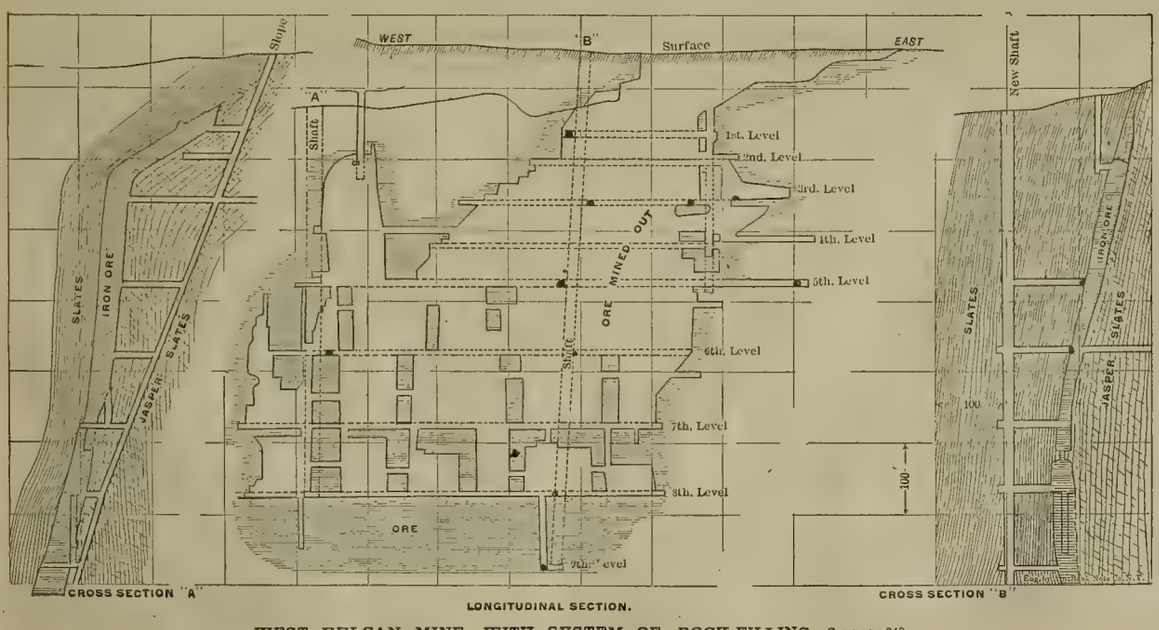


The accompanying engraving represents the new 60-inch gang edger, made by the Vulcan Iron Works of this city. These works have for some years made a specialty of first-class sawmill machinery, and have fitted out many of the largest sawmills on this coast. This new gang edger is just being patented through the Mining and Scientific Press Patent Agency. It is a very heavy machine, and the latest designed in the market, having several valuable improvements over the machines of other makers.

The arbor has three bearings on the frame, all running in patent self-oiling boxes, extra long, lined with genuine babbitt, and bored out on frame, thus making a perfect running arbor, which will not heat. The arbor is 10 feet 8 inches over all, is 4 inches diameter, made of select machinery steel, and is warranted practically true.

The driving pulley is 20 inches by 20 inches solid center, turned inside and out, and the greatest care is taken to have this pulley perfectly balanced.

The saw collars are made of cast iron with phosphor bronze clamp nut to prevent corrosion, and run on two machine tool steel feathers, planed true so that the collars may be put on the arbor either way and the machine changed from right to left or vice versa at any time.



The handles for moving the saws are plain steel handles, and have no spring, catch, or other trigger, to hold the saws in place, and when the saws are in the desired position, the handles drop into a notch in the figure bar, and are held rigidly. The connection between the saw and handle is made with a hinge so that the saw-shipper may be lifted up and every collar removed from the arbor in a few minutes. With this convenience of changing there is no excuse for running dull saws. The machine carries six 24-inch saws, and is warranted to work cants eight inches thick.

THE VULCAN IRON WORKS NEW 60-INCH GANG EDGER.

The feed works are strong and powerful and are all mounted on the frame, thus insuring perfect alignment of the pulleys and belts. There are no short belts to slip or give out from being run too tight and no cross-belts on the machine. The feed-belt has a tightener, which acts automatically, and the tightener for raising the rolls is always within reach of the edger-man. There is a brake attachment to the roll-lifter, so that the rolls may be held at any desired position for a series of cants at the will of the edger-man.

The feed can be varied also at any moment by the operator, which is almost invaluable for heavy cuts and tough timber. There are no discs for feed gear to wear out, no friction pulleys to replace, no counter-shaft to put up in the top of the mill or elsewhere, and there is not a spring of any kind on this machine. It is made of the very best of material and the whole machine is self-contained, as the cut will plainly show. One of these machines has recently been shipped by the Vulcan Iron Works to the Sanhedrin mill, Elk Creek, Colusa county.

CROSS SECTION "A" LONGITUDINAL SECTION. CROSS SECTION "B"

WEST VULCAN MINE, WITH SYSTEM OF ROCK-FILLING.—See page 248.

The Grand Prize.—At the annual meeting of the Grand Prize M. Co. it was shown that the receipts during the year amounted to $128,782 02, made up as follows: Assessment, $84,263.90; Grand Prize ore reduced, $12,165.53; concentrating ore from other mines, $1937.46; overdraft on Sept. 1, 1889, $30,415.13. The disbursements consisted of an overdraft of September, 1888, for $20,021.66, and money paid out for working expenses, $108,760.36. The following officers were elected to serve during the ensuing 12 months: J. E. Dixon, President; Thomas Cole, Vice-President; R. Grayson, Secretary; J. W. Grayson, Treasurer; H. Zadig, William Bowers, Archibald Borland, Directors, and H. W. Coffin, Superintendent.

The changes to the concentrating plant of the Commonwealth Mining Company at Tuscarora will be completed during the first half of October, and the work of ore production will then be resumed.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

San Francisco to Alaska.

(*Concluded.*)

[Written for the PRESS by GRACE STEWART.]

After four days' sailing the ship dropped anchor in Loring harbor, a town which consisted of a cannery and several Indian houses. The small boats were lowered to convey those who wished to go ashore; some went rowing, others roamed about on land, gathering ferns and flowers, while the majority were getting their fishing-lines ready for an evening's sport. It was not long before the fish were hauled in by scores. No sooner would you throw out your line than you would have to draw it in again. Some got tired of fishing for one at a time, so put two hooks on the line. One passenger got excited—it was not a woman this time—put three hooks on and then had all he could do. Think of catching three fish at a time, one on each hook. Some did not think it worth while to bring up one, but would wait for the second or third. They were mackerel, different from those in the East, measuring from 12 to 21 inches. We were told of those wonderful fish that were so eager to be caught, and one Eastern gentleman shook his head and laughed scornfully, but when he saw for himself that it was no fish story, just the actual truth, he said, "Well, I'll have to believe it now, but I'll be switched before I'll tell it east of St. Paul."

We could not realize that it was half-past ten when the anchor was lifted, for it was as light as it is half an hour after sundown in California. The next forenoon was spent at

Fort Wrangel.

The objects of most interest there are the totem poles in front of the Indian houses; only the rich erect these poles, as some cost a thousand dollars or more. They are tall cedar poles with carved faces of men and beasts, in the most horrible forms, representing the generations of the family; the eagle is the great emblem of the mother. Some of these poles are nearly 50 feet high.

The Indian houses are rude, square buildings with immense round timbers supporting the roof. They build their fires in the center of the room, and the smoke issues through a square hole in the roof. Several families live in one house. We went into many of these homes where their wares were displayed. Over the graves of some of the dead are large log-boxes 20 feet high or more. On one is a life-sized whale and another a bear, both carved from trees. The totem poles and graves have been standing for many, many years, the moss growing on them several inches high. The Stikeen river empties into the salt water near this place.

We soon came into Wrangel Narrows, and for 30 miles we are again locked in by high perpendicular mountains covered with forest trees. Here three glaciers are seen at one time, the largest measuring four miles across the front and extending back 40 miles. All the passengers on board rushed for their field glasses to gaze more plainly on, perhaps, their first river of ice. More glaciers were seen farther on, also a high projecting peak called the "Devil's Thumb." On the 21st of June we landed at Juneau. As it was raining and very wet under foot, we did not venture beyond the numerous stores filled with curios. Indian baskets of all shapes and sizes, carved images of slate and wood, miniature totem poles and canoes, furs of all kinds, etc., can be found in these stores, which are kept by Americans.

At 7:30 in the evening we left that city for the

Mines on Douglas Island,

Three miles distant. Although the rain came down in torrents, we picked our way up a short, steep hill to the Treadwell mine. The vein of ore is 464 feet wide and extends along the mountain three-quarters of a mile. It is now being worked from the surface down 250 feet, and below that point a train of cars conveys the ore a few hundred feet through a tunnel into the fourth story of the mill, which is of 240 stamps and crushes 600 tons of ore every 24 hours. The rock averages $7 per ton, and the mill is the largest in the world. The guide went ahead with a candle among that wild and clashing machinery which nearly deafened us. It was useless to try to talk to each other, for if one screamed as loud as he could, he could not hear his own voice. We were taken from top to bottom and had the different parts explained by signs and motions. We looked down into the mine 250 feet where the Burleigh drills were at work. From 25 to 30 blasts are set off every morning, noon and night, and sound like so many reports from a cannon which re-echo against the hills. We gathered some very delicate wild flowers and ferns and returned to the boat about 10:30. Even at that late hour it was far from being dusk. As it was the longest day of the year, some of the ship's passengers sat up all night and could see plainly to read fine print or write, on deck, at any moment, although it was cloudy. We did not leave Douglas Island till the next day at noon, so had ample time to take a stroll about the town.

The Indians.

Down by the water's edge is a long row of Indian houses; some were the worst and most forlorn-looking places we saw anywhere. We were dressed in winter clothing, but the natives do not seem to mind the cold. The little children were out in the rain with scarcely anything on them, sometimes nothing but a shirt. Many of the men and nearly all of the women go barefoot; the majority of the men wear citizens' clothes, while the women wear calico dresses with heavy, bright-colored striped blankets around them and black, yellow or red silk handkerchiefs tied over their heads; their features resemble the Japanese. They keep their babies tied up in little willow baskets, or put them in a small hammock made by tying a rope to each corner of a little blanket. In most of the towns the men take care of the babies while the women sell their curios. They always keep their silver bracelets on their arms and the rings on their fingers; their favorite position for resting is to kneel down and put their head in their hands. There are many cripples; pneumonia and consumption are frequent diseases among them; there are more drunken women than men. It is quite common to see the old women and some of the children with their faces blackened, which makes them very hideous and frightful to look at. It is hard to tell why they do this; some say it is to preserve their complexion, others, a sign of gladness or sorrow. Some wear nose rings and lip rings; when a long, flat-headed silver pin, an inch in length, is thrust through the lower lip, it signifies that the girl has reached the right age for marriage; after the marriage, the silver pin is taken out and an ivory button put in its place, sometimes an inch across.

The scenery about Chilcat and Pyramid Harbor, our most northern point, 59 degrees 11 minutes north, made us feel that we were certainly nearing the Arctic regions, many, many miles from home. At the former place is where the highly-prized Chilcat blankets are made that sell from $15 to $75 each; they are woven from the long fleece of the mountain goat and average one yard in width and about two yards in length; the lower edge has a deep border of fringe. The colors are principally black, white and yellow, covered with sea-mosses and plants. Pyramid Harbor is rightly named from the lofty peaks that rise above all others. We were then within 15 miles of the headwaters of the Yukon river and about 200 miles in the northeasterly direction from Mt. St. Elias, the highest peak in North America, 19,500 feet. The summit is covered with eternal snow and has never been explored more than half its hight. At both these places there are large salmon canneries, but none were yet open, as the salmon were late in running this season. It is not uncommon there to see bears roaming about upon the steep hillside in the bright sunshine.

The Glaciers and Icebergs.

We were continually watching snow-clad mountains and glaciers until we reached Glacier bay, where something of even more interest took our eye. There was a shout and a cry of many "Ohs!" when the first floating ice was seen; it was not long before we were in the midst of it. Ice of the smallest size, up to five and ten feet in diameter, came floating along while our ship was turning to all points of the compass to keep out of its way. We at last anchored in front of a small cannery, that looked as though it was lost in so far off a place. About 2 o'clock in the night, although it was nearly as light as day, the anchor was drawn up, and we again plodded through the water—northward—among those dangerous-looking icebergs. Those the day before were babies beside what we were then passing. The passengers were early risers that morning. All kept running from the bow of the boat to each side, to watch the huge cakes come bumping and cracking against the front of the boat, then swinging to one side, or making a straight line for the paddle-wheels, which could make but one revolution at a time for several miles, and even then the bergs struck the paddles, splintering them, turning the cakes completely upside down, or grinding them to a thousand pieces. This shook the ship like striking a rock. We passed several as large as our ship. The captain was so kind as to go quite near one iceberg, which was higher than the yard-arms, 80 feet out of water, and stopped the engine long enough for a photographer to snap his camera at the huge object. It is easy for one who is used to these icebergs to tell whether they are dangerous or not; as the water is not as salt here as in the open sea, only one-eighth projects out of water. The solid ice beneath gradually loosens and great cakes will separate and fall out from beneath. This makes the berg top-heavy; they will sometimes turn completely over, making the water splash and tumble around them for some time. They are of exquisite beauty, of every shape and size, sometimes blue as the soft skies, then flashing all the colors of the rainbow in the bright sunshine.

The Muir Glacier.

About 8 o'clock the ship dropped her anchor in 21 fathoms of water within a few hundred yards of one of the most beautiful glaciers in the world. From one side, even with the water, issues a swift, muddy river. Says Mr. Dawson: "Glaciers more immense than those of Switzerland creep from the mountains' summits to the water's edge. Of all these icy rivers the Muir glacier, a frozen wall of ice, 500 feet in thickness, with a breadth of from three to ten miles and a length of 40 miles, rising 300 feet at its mouth above the waters of the sea, is the most wonderful and sublime. Large sections of it are constantly breaking off and falling into the sea, displacing the waters and producing detonations like peals of thunder, causing the ship to plunge and reel at her moorings. Each of these becomes an iceberg, floating off with its imperial colors into the foaming and angry waters. The peaks rise 15,000 to 20,000 feet above the sea, containing within their frozen walls many glaciers, but the Muir is the most striking and extensive. There is nothing grander in all the world. The ice deposited during the glacier age is slowly washing away, exposing giant cedars which have been buried for thousands of years. Here is a spot for the tourist who desires to see the world in the original form of its creation." [See cuts page 249.]

We stepped into the little boats, and in a few minutes were on shore, which seemed like a foreign land. Following a little canyon, we were soon hurrying over the rough and sharp-edged rocks, which was only a thin carpet over a mountain of ice. It seemed more like being on a glacier when we reached the clear, white, honey-combed ice, free of stones and boulders. Keeping on, we soon reached a comparatively high point overlooking a small portion of the icy river; there we stood for some time gazing at the wonders about us. A portion of the crystal river is heaped into rounded hills and knolls; a greater space in the center, which is stated by scientific men to move 60 feet a day, is splintered into thousands and millions of spires and pinnacles from 10 to 30 and even 40 feet in hight, shaded from a deep sea-blue at the base to a silvery white at the summit. Over the whole of the glacier there are thousands of crevices, and rushing water can be heard dashing and gurgling in the depths below. One must be on the lookout where he puts his alpenstock, for often you come suddenly upon holes not more than a foot across the top that extend to the very bottom of the river. While roaming around, we discovered a well about four feet in diameter; one by one we lay flat down and looked into one of God's wonders—a beautiful sight. The hole gradually grew smaller as it descended; looking through a small space, we could see that it again widened and branched off we knew not where. About 20 feet from the surface large drops of water, more beautiful than diamonds or emeralds, trickled out of the blue ice, striking pinnacle after pinnacle, separating, then dropping far out of sight. A large stone was thrown down which bounded from side to side; then hark! it strikes a bench, pieces of ice and stone go rattling down, down, and splash in the running river a hundred feet or more below. After tearing our overshoes to pieces and getting mired down in the light glacier mud, we re traced our steps, walking about on the sandy beach lined with small stranded pieces of ice, watching the front of the glacier, which I have before stated was a precipice 300 feet above the water. Small pieces of ice come tumbling down, and we know that larger ones will soon follow. There! it cracks, totters, weaves forward and backward, slowly at first, then faster, till it plunges down with a terrible crash—a piece of deep blue ice larger than our ship. It sinks out of sight, rises up like a mountain, sinks and rises again, then floats slowly toward our ship, but she is away far enough to be out of danger. The water which was before so calm and still rises like a heavy sea, the waves come faster and faster, followed by others, till we are obliged to run up a rocky canyon to keep from being drawn into the cold, icy waters. This heavy crash loosened many other large pieces, and for a moment it seemed as though the whole front was coming down before us. No sooner do these rise from their watery home than piece after piece come cracking down upon them, sending icy splinters far up in the air. All this, with the Fairweather range in the distance, the highest peak—Mt. Crillon, 15,900 feet—perfectly white with snow, reaching far up into the clouds, makes one feel as though he could not speak, but stand motionless listening to the unaccustomed sounds about him. The half-day at Muir glacier was the grandest of all and makes one feel more than repaid for all the miles he has traveled. We were sorry to leave that spot. As the ship swung round and plodded through the ice-field again, we took a long last look.

About three hours before reaching Sitka we are in narrow passages and among islands more beautiful than any we have yet seen. Mt. Edgecomb, 2900 feet, 12 miles distant, was an active volcano less than 100 years ago. We sighted the smoke from the Corona and in about three-quarters of an hour were side by side. The Ancon had stopped, but the captain of the Corona did not care to talk to us and went sailing by as if no boat was in sight.

Sitka, the Capital of Alaska,

Lies in a secluded bay surrounded by 98 islands, reflecting their tree-covered summits in the mirrored waters. It is the prettiest city in the Territory. The barracks, the custom-house and the governor's castle are grouped together on a high knoll; the castle is a heavy, plain, square structure, built by the Russians in early days, but is fast going to decay. It is 140 feet long by 70 in width, built of heavy cedar logs, and in former years was handsomely furnished, regardless of expense. Since it became Government property of the United States, 17 years ago, all relics were carried away and it is now a rubbish-hole; a fine view can be seen from the roof on a clear day. The object of most interest is

The Greek Church.

The bulging spires, the pale-green roof, the fine clock and chime bells, give it a queer architectural look. It is built of cedar logs, clap-boarded on the outside and canvased inside; the outer paint is light-drab, the interior white. Like all Greek churches, there are no seats, as the congregation always stand or kneel. The main altar is reached through a pair of bronze doors set with silver and gold images of the saints. Only the priests can open these doors and no woman is ever allowed to pass through them on any account. Over these doors is a large picture of the Last Supper; the faces are painted on ivory and the figures draped in robes of silver. On each side of the altar are two very large wax candles, which are kept lighted during every service, but last five years; they cost $40 each. Back of these are other large paintings of the saints covered with robes and draperies of the same chased silver. From the ceiling hang heavy chandeliers and silver lamps. On one of the panels in the side altar is a marvelous painting of the Madonna, which was sent from Russia 80 years ago. One who is fond of such art could stand hours looking at the beautiful, soft features of each, which look as though they could speak. The faces and hands are painted on canvas, but not a stroke of the brush is visible. A drapery is wrapped about the head and shoulders of hammered silver and gold of the finest work imaginable; $20,000 has been offered for this painting, but refused.

Other very old but much less valuable paintings were scattered over the walls. We were shown several very costly robes worn by the priest; some were damask of heavy velvet embroidered with bullion; those worn on Easter Sundays were cloth of gold and silver, most dazzling to the eye. The crown worn by the bishop is quite tall, with genuine diamonds, amethysts, pearls and rubies thickly set in a filigree of gold. During every marriage service crowns, much smaller, are placed over the head of the bride and groom. The choicest treasures of the church were sent to San Francisco about three years ago for safe-keeping, but not long after the church and contents were destroyed by fire.

Along the edge of the sidewalk on the main street sat 30 or 40 Indian women in their bright-colored dresses and handkerchiefs holding out their baskets and curios for our inspection. Back of the city a short distance is a beautiful hard pebbled walk, made by the Russians, which winds through the shady forest, among the most delicate ferns and wild flowers; old stumps of trees are covered with bright-green mosses of many varieties. Across the clear, crystal waters of the Indian river is a small suspension bridge; around there persons can ramble for hours gathering blueberries, salmonberries, blackberries, strawberries and other kinds in their season, or sit on the rustic seats and say, Oh, what a restful place, compared with the rustle and bustle a city life. Cedar trees six feet in diameter can be seen, with ferns and mosses growing far out on the limbs. As we returned, we stepped into the Jackson Institute, a Presbyterian mission-school and home, and were kindly taken through the building by Mr. Jackson himself. There are 150 girls and boys in the school, the majority taken from their dirty homes or picked up in the street; they are clothed, educated, taught a trade, sent out in the world where positions are found for them, being much wiser than their parents. An entertainment was given by the children in the evening, which was excellent.

After giving this city an adieu, we retraced our course

Through Sounds and Channels,

Stopping for a few hours at the highly perfumed herring-oil town of Killisnov, then passing the entrance to Glacier bay. Around the upper point of Admiralty island we touched Juneau and Douglas Island. The clouds were separating and the sun trying hard to give us a welcome, but we soon ran into the dense fog, that settled down over the islands and main land and shut out our entire view. We were guided by the echo from the ship's whistle which blew every few moments. A second of silence after the screech of the whistle, then a long, clear echo, gradually growing fainter, till it was nearly lost in the cold, damp fog, then from the opposite side it came louder than the first, lasting from 15 to 25 seconds.

Coming to the entrance of Wrangel Narrows, the fog was so dense the engine was stopped and we drifted around the bay for some time; floating ice came out from its long hiding-place from some glacier not far off. At last it became lighter, the high-topped islands showed themselves, and soon the shores on either side were plainly visible. The bell rang, the engine started and the Ancon was plodding along through the narrow channel. Pursuing our way south, for we were now homeward bound, turning an angle between two islands, we again came in sight of the prettily situated town of Fort Wrangel. Snowy mountain-peaks that were before hidden in the dark, heavy clouds now loomed up in God's glorious sunlight in the shapes of castles, lions, bears, etc. As this is the only place where the totem poles exist, the tourists were all eager to take one last look at the queer, roughly carved structures.

At Dixon entrance and Milbank sound the strong wind from the ocean gave us an idea of what an outside passage would be; the boat rolled and pitched until it was impossible to

promenade the deck longer. The captain intended to pass Queen Charlotte sound that evening, which is 40 miles of open sea, but for the sake of those who were troubled with seasickness, he ran the boat into a picturesque little inlet called Safety Cove. The water there was as calm and still as a small lake; the wind ceaseless. Before time for the people to rise—I cannot say daylight, for we were then so far north that there was only about two hours of darkness—we had passed the dreaded sound into still water again. As we were nearing the end of our journey the nights became longer and the people knew better when it was time to retire.

Nothing more of consequence happened; we were landed safe and sound at the Tacoma wharf on the evening of July 2, 1889, having traveled 2700 miles since departing from that place. Before leaving the ship a set of resolutions were passed and signed by all the tourists expressing their thanks and gratitude to the captain and officers for their kindness to the passengers.

As we were again in the noisy, rattling cars, in dust and heat, we almost wished we were in the cool, bracing atmosphere of Alaska.

Tuolumne County Mines.

The Chaparral.

EDITORS PRESS:—This mine is owned by Mr. Fred Wedzell, a carriage-builder of Sonora, and is located on the Tuolumne river southeast of the Buchanan mine, and adjoining that property on the south. In area it is 1500x600 feet, and covered by a mineral patent. Its extensions run to the river below, at which point there was a ten-stamp mill, but it was burned down. The turbine wheel still marks the site where the battery stood. This mine can be opened from the mill-site, giving backs of not less than 2000 feet to the apex of the mountain. There has been considerable work done on the property, but a large amount of it is almost useless, owing to the gross ignorance and carelessness of the men employed by the then owners. They were all business men, knowing nothing of mining, and trusted implicitly to their hired miners, leaving it to them to run the business as they saw fit. Instead of running on the veins and prospecting their value, they ran hap-hazard in country rock, sometimes in the footwall, then cutting through the veins, filling up drifts and doing the work in the most reckless manner. This seemed to me a systematic design on their part rather than an actual want of mining knowledge—perhaps to get possession of the property themselves—for after work was suspended and the men paid off, rich rock was discovered which had been covered up and not reported to the owners at the time it was found. The mine naturally received a "black eye" from the length of time and amount of money spent—over $20,000—with nothing found. Yet when the mine was first opened by a shaft from the surface in a five to seven-foot vein, exceedingly rich quartz was taken out and worked in an arastra. The chute was cut through, perhaps by mistake, and the shaft allowed to cave in. Subsequently three tunnels were entered, the lowest level being 600 feet in length, or rather distance; for if it had been continued 60 feet farther it would have come out not far from where the tunnel was started—almost running in a circle. Rich ore has been found, nevertheless, in this level, and continues downward below water-line, which I have examined. The middle tunnel—300 feet—shows two large-sized veins. At the junction, or point of contact, here I have seen rich quartz of high grade, being a continuance of the chute that was found in the shaft first mentioned. The formation is slate of a black, metalliferous character, containing considerable manganese, which permeates the quartz.

There is scope for works of great magnitude on this property, for a low level tunnel can be entered at or near the river, giving backs of over 2000 feet. The power for air compressors or electricity can be cheaply and easily obtained by water from the turbine wheel now in place. This tunnel would develop all the veins and spurs known to exist in this mountain-side. A mill of any size, with free water, can be built on the mill-site belonging to this group of mines. Further, the tunnel can be opened and driven on the main vein the whole distance. Why do capitalists seek mining ventures in Mexico, South America, Africa, Alaska and numberless outlandish places, while at home in our splendid climate and easily-accessible districts our mines are left forsaken and uncared for? It was only a few days ago a mining gentleman from New York visiting our county was astonished at our mineral resources, and confessed he was ignorant of the fact that we possessed such rich mineral wealth. His time was too limited to stay sufficiently long to acquire more knowledge, but he became interested in several claims during his short visit that will cause him to return later on. Thanks to the MINING AND SCIENTIFIC PRESS, which is read largely in the East and becoming daily more sought after, read and relied on for its careful and truthful statements and reports of the mines of California, in a short time capital seeking investment from the East and Europe will see plainly it is to their greatest advantage to visit California before risking their cash in doubtful places and in wildcat schemes, where distance only lends enchantment to the view.

Sonora. ARGUS.

NEW GAME BIRDS.—The State Fish Commissioners are importing some new species of game birds for propagation, among which are Australian quail and Japanese pheasants. They are doing this under authorization of an Act of the Legislature, approved on the 16th of last March, by which they are instructed to import improved varieties of game bird.

MONO.—At the annual meeting of the Mono G. M. Co., the following officers, being re-elected, will serve during the ensuing 12 months: George I. Ives, president; L. Osborn, vice-president; B. L. Burling, secretary; David Woods, assistant secretary; John Kelly, superintendent; Bank of California, treasurer.

Marshall's Monument.

EDITORS PRESS:—Standing on a rounded knoll overlooking Coloma, the Marshall monument presents a fine appearance in the distance. The site, which was presented by Placerville Parlor of the Native Sons of the Golden West, is excellent. A fine roadway has been graded to the summit, but still lacks a few hundred feet at the base of being complete.

Marshall's figure represents him standing with a nugget in his right hand, while the left points to the site of Sutter's mill, where Marshall first found gold. Marshall is represented as dressed in a slouch hat, shirt with sleeves rolled up to the elbows, and pants with legs inside of rubber boots. A knife in its sheath is attached to his belt on one hip, while a holstered pistol adorns the other. The figure is large and life-like; not so the color. Standing near the monument gives one the impression that the figure had been executed in oil—that is, lamp-black and oil—and in consequence Marshall looks like a grimy coal miner just up from the shaft. The monument is of granite and some soft rock that looks like lava ash or terra-cotta. The granite is all right, and the monument would have been a success had it been made entirely of this rock.

On one side is the inscription giving the dates of the birth and death of Marshall and the statement that he first found gold in Sutter's mill-race on the 19th day of January, '48. On the opposite side are the names of the commissioners in bold relief, so bold that it would indicate that the monument was erected rather to their memory than that of Marshall.

On the front is an attempt to bring out in relief the seal of the State, while on the back is a supposed representation of Sutter's mill, the race, and a miner, taller than the pine trees surrounding him, trying to hold fast to a perpendicular bank and dig at the same time. Nature will soon kindly obliterate all this, as the material in which it is gouged out will soon crumble away. It is already cracked, and here and there a piece has chipped out.

The derrick used in the erection of the monument still stands over it as though waiting to take Marshall down whenever he shall feel like freeing himself from his coat of soot. If there was ever a case where "distance lends enchantment," Marshall's monument is one of them. The site is grand, and, in the distance, the monument and figure of Marshall look well, but on close examination the whole thing looks cheap. The State should either have put in a plain granite slab where the present relief burlesques are, or close the road leading up to the monument and thus prevent a too close inspection.

E. H. SCHAEFFLE.

Coloma, Cal, Sept. 8, '89.

THE Paradise mines, Nevada, are said to be looking better than for many months past. The Wild Goose is producing very good ore, of which there is considerable in sight. Supt. McCurdy is making arrangements to run the mill night and day.

The Folly of Abandoning Mines.

From Grass Valley to Forest Springs, a distance of four miles, there were in 1866 no less than seven mines running. In a few years after that there was scarcely a stamp dropping on any of them. They were worked out and abandoned in all, except holding the title. A year or two ago work was begun on several, and now the sound of the pick and shovel, the drill and the stamp-mill is heard all along the line. The Omaha employs a hundred men and keeps 18 stamps running night and day. The Hartery is being systematically reopened, and will soon be fully equipped for work. The Norambagna has changed hands, and will be in full blast after awhile. Success is attending the operators, and it is reasonable to expect that the district will be a very lively one before another year. The experience there proves that the shutting down of a mine is not evidence of its being worked out. The North Star and Empire mines at Grass Valley are other instances showing that those who were regarded as wise miners years ago could not see into the ground, and when they shut down did not know what they were doing. In Nevada district there has been the same kind of work done. Some men show their wisdom in shutting down a mine as soon as they encounter a bad break of ore. But when a successor comes along, who has nerve enough to explore further, a good paying mine is made out of the one abandoned. There are a half-dozen mines lying idle within sight of this town, which were once rich bullion-producers, that if reopened and sunk upon, would, without doubt, develop into dividend-payers again. The company that has determination enough to try the experiment will make a good thing.—*Grass Valley Union.*

VIEW OF UNION SQUARE, SAN FRANCISCO.

Union Square, San Francisco.

On this page we present a fine view of Union Square, San Francisco, one of the few breathing-spots within the city limits. The view in our engraving is taken from Geary street, and presents, besides the elegant walks and shrubbery of the park, several fine buildings on the opposite side on Post street. These "lungs" of the city, as they have been not inaptly called, are not too numerous where they can be conveniently availed of by those who are in most need of them, and any fine day will find the seats located here and there in Union Square fully occupied by those who want to enjoy the sunshine and a breath of fresh air in the heart of the city. Being photographically correct, adds value to our picture to readers abroad as well as in the city.

THERE will be 12 bullion-producing mines on the Comstock lode when the flow of water in the Carson river will admit of operating the mills along its course.

TWENTY SIX brick buildings have been put up in Bakersfield since the great fire.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLOSED.—*Ledger*, Sept. 21: The Morley Co. suspended operations upon their property, the old Wetzler mine, Hunt's gulch, on Thursday of last week. This step was taken in obedience to a telegram from headquarters in London, stating that full instructions as to its future course would be sent by mail. It is generally believed that the company intend to abandon mining in this county. The Morley venture was regarded by mining experts as an unwise one. There was little in the past history of the claim to justify any expectations of meeting with a pay chute.

NORTH STAR.—The east drift at North Star has encountered the footwall and gouge matter at a distance of about 70 feet from the shaft. This is regarded as the most important development yet made. No quartz has been met with worth speaking of, but by running along the wall north and south it is confidently expected to find a well-defined quartz ledge. The rich ore met with a year ago was frozen to the granite; there were no traces of gouge or walls, and the ore seam could hardly be expected to widen out into the dimensions of a ledge under such conditions. It showed that rich quartz existed within the claim, and now the discovery of gouge and footwall gives birth to a reasonable hope that the parent ledge will ere long be discovered.

THE THIRTY-STAMP MILL of the Cosmopolitan mine is expected to start up early in November. There is every reason to believe that this property will at once take its place among the list of dividend-paying mines. The company have from the start conducted their operations in a business-like way. After a thorough exploration of their ground, reaching to a depth of over 500 feet, revealing extensive bodies of gold-bearing quartz, the erection of a mill was decided upon. The owners were willing to expend their means liberally in first proving whether or not a mine existed within the limits of their claim, and not until this point was affirmatively settled as far as anything short of the actual milling of the rock can settle it, were preparations made to put up a mill. The owners of the North Gover are determined to set to work and immediately develop their claim. From its present promising appearance the company expects, by the judicious expenditure of a little money, to lay bare a ledge whose gold-bearing qualities must be equal to that of the Gover, as it is undoubtedly a continuation of the same ledge. In the tunnel which is being run on the Paugh mine, near Clinton, they have struck a large body of water flowing a steady stream of about five inches. The tunnel is not much over a quarter of a mile from the McKenzie mill, and the McKenzie Bros. are contemplating putting in boxes to run it to their roller-quartz mill for battery purposes, and start up by steam.

Calaveras.

A LARGE LEDGE.—Calaveras *Prospect*, Sept. 21: We were surprised to find a quartz lead within rifle-shot distance of the county seat, at this late day undeveloped, yet for years known to be rich. At different times within the last 25 or 30 years rich deposits of quartz gold have been taken out by different parties, but at no place on the lead has any one gone down on the vein to a depth of over 35 or 40 feet. About a month ago Mr. Morehouse bonded 1500 feet of this lead from Mr. McFall, with the privilege of prospecting the vein for one year. In the last two weeks a perpendicular shaft has been sunk to a depth of 35 feet in the foot-wall of the lead. At 12 feet from the surface, quartz appeared in the shaft, and at 35 feet a four-foot vein had been crossed. Saturday evening a large piece of rock was brought to town and mining men here pronounce it to be as fine a piece of rock as ever was brought to town. As there is more water than can be handled conveniently with a windlass, Mr. Morehouse will sink for a sump and then drift across the lead. At this point the vein is about 30 feet wide on the surface; 100 feet south the vein shows a body of ore 60 feet in width; and north for at least 400 feet the croppings on the surface show a ledge from 40 to 75 and 100 feet in width. In crossing a gulch 100 feet from the shaft the croppings carry free gold. In a reef of solid quartz, about midway of the ledge, where the vein is from 60 to 80 feet wide, we saw gold with the aid of the glass, and also with the naked eye. A small prospect can be had from almost every piece of rock you pick up on the surface. Mr. Morehouse told us that this was the finest prospect he had seen in a great many years in quartz.

THE ARIEL MINE.—*Mountain Echo*, Sept. 19: We visited the Ariel mine, owned by Hutchinson & Brackett, and situated at Spanish Bar on the Mokelumne river, and were shown through the tunnel recently run on the property. The vein, which makes its appearance at the mouth of the tunnel about an inch in width, courses along the tunnel line and widens as it is developed. The tunnel is in over 40 feet, and in the face the ledge is about four inches in width, giving evidence that as it is followed into the hill it widens. It has been traced on the surface for half a mile or more, the croppings being quite prominent in many places. As fine a lot of specimens as we have ever seen have been taken from the vein in the tunnel. The ledge is a pocket vein. Quite a handsome little sum has been realized by crushing assorted ore in a hand mortar. Several hundred dollars worth of specimens have been shipped to the East to be placed on exhibition. Some of the ore we have seen will yield at least $5000 a ton. The tunnel is being pushed ahead as rapidly as possible.

Fresno.

NORTH FORK DISTRICT.—Cor. Fresno *Republican*, Sept. 20: Northeasterly and distant from Fresno about 100 miles is situated what is known as the North Fork mining district. The veins will average from 3½ to 9 feet in width, showing a high-grade milling ore, namely, black sulphurets of silver in combination with arsenical sulphurets carrying heavily in gold. The most promising locations are the Desota, Eureka, Fresno, Advance, Mountain Meadow, Bright Metal, Pierce and Dodge mining claims, lying in syenite and black slate formation, with an abundance of excellent timber, water-power, etc., in fact fully possessed of every facility necessary for successful mining operations. Farther southeasterly are the Fish Creek mines discovered by Edwin Fore & Co.

Inyo.

A PLACER PROSPECT.—*Index*, Sept. 18: We learn that Crit Hampton has struck placer diggings in the vicinity of Big Pine which prospect as high as 15 cents to the pan, and that he is now arranging to work them.

Lassen.

HAYDEN HILL.—Lassen *Advocate*, Sept. 21: Mr. L. H. Hopkins came in on Sunday and reports times as being very dull in that once lively and flourishing burg. Like all other mining camps it has its ups and downs, and from what Mr. Hopkins tells us of the prospects there, we would not be surprised to hear at any time in the near future of another boom striking the town, surpassing anything of former years. There are only four claims now working on the hill, and these employ but few men, most of the prospectors having gone toward the valley for winter quarters. A few men are still "Bug Dusting" on the dump of the old Juniper. The Golden Eagle, now owned by Mr. Hopkins, has paid for years and work is still in progress. The main shaft is down 290 feet, with a fine foot-wall all the way, and good prospects in the bottom. The Evening Star, formerly owned by the Hoes Bros., and out of which they made a fortune, now owned by Preston & Howard, is being worked by the latter gentlemen and is looking well. The Brush Hill mines are also being developed by a company of Belgians, who bought the property from the Hoes & Harbert Bros. Mr. Hopkins thinks that if Hayden Hill had one good company to take hold of its mines it would prove one of the best producing camps in Northern California.

Mono.

GREEN CREEK MINES.—Bridgeport *Union*, Sept. 15: The Green creek mines are attracting much attention and the locators of mining claims in that section are to hold a meeting for the purpose of organizing a mining district. Good rock is almost daily brought in from the creek, and the prospects are seemingly good for it to become a lively mining camp in the near future. The ledges are large and the ore assays away up.

Monterey.

COAL-OIL FIELDS.—Salinas *Democrat*, Sept. 21: There was filed for record this week a location notice of a placer-mining claim of 320 acres signed by 16 locators, each claiming 20 acres. The purpose of the location is to mine for petroleum, asphaltum, gas and other mineral. The claim is known as the Alsop claim, and was discovered by Alsop and sons a short time since while boring an artesian well. The oil pumped from the well is said to be the finest quality of lubricating oil, and the formation in which it has been struck is the one in which oil abounds wherever discovered in great quantities in the Eastern oil regions. It is situated about six miles from Salinas and between the Toro and Buena Vista ranchos.

Nevada.

MINING CLAIM BONDED.—Grass Valley *Union*, Sept. 22: The Good Hope quartz claim, in the Cabbage Patch district, west of Spenceville, was yesterday bonded to Messrs. George Gurne and George Gamble of Santa Rosa, Sonoma county. The ground was located some time ago by Wm. Eddy and Alf Gale of this place, who had sunk a shaft on the vein to the depth of 45 feet. By the terms of the bond Messrs. Gurne and Gamble are to sink the shaft to the depth of 100 feet and drift on the vein the same distance. The other conditions of the bond are private. The claim is said to prospect encouragingly in free gold. The work of sinking the shaft will be commenced to-morrow by six practical miners.

Placer.

HATHAWAY.—Placer *Argus*, Sept. 21: We visited the Hathaway mine, at Ophir, Tuesday. Ten stamps are kept running on good ore, and as soon as there is sufficient water, the other ten will be put in motion. They are now working on the 200-foot level, and taking out fine ore, which carries quite a large percentage of silver. The ore is run from the mine in cars, a distance of about 150 feet to the ore-bin; from there it passes through the rock-breakers to the self-feeders. The pulp after passing over a large surface of copper plates is received by four Garnier concentrators, which separate the sulphurets and any fine gold that may pass the plates from the lighter material. Two carloads of the concentrations have been shipped to Denver, Colorado, to be worked. Working for silver in this section is something new, but the company have found that there is sufficient silver to add considerably to the value of the ore if it is saved, and they propose to work it for all there is in it. The construction of the concentrators in use at the mine is very simple, and besides doing good work they are a cheaper machine than most of the concentrators now on the market. There is also a Woodbury concentrator at the mill which will be given a trial soon. The machinery is all run by water-power, which is quite a saving compared with steam-power. The Hathaway is without doubt a valuable property, and is evidently under good management. Several other mines are being developed in the district, and the indications now are that Ophir will again become a lively mining camp. The Hidden Treasure Co. has passed through the cross channel encountered some time since, and is getting the old-time yield of bullion. A drift of some 300 feet in length has been run in the north gangway of the Mayflower mine, through a deposit of yellow quartz, gravel and sand. This crosses the regular channel at right angles, and sinks about 12 feet lower. Good prospects are being taken from it. It is thought to be the Orono channel. C. W. Reed from the Drummond mine, near Iowa Hill, says the mine is looking well and they are milling about 20 tons per day with their new Huntington roller, which is equal to a ten-stamp mill. John B. Hobson of Iowa Hill was in town the early part of the week. Mr. Purdy speaks very favorably of the Whisky Diggings copper mine.

BRYAN MILL.—Placerville *Observer*, Sept. 21: John M. Bryan came over last week from the Harmon mine at Iowa hill, where he has started one of the Bryan roller-mills. The mill is doing its work so well that the owner of the mine, Gov. Waterhouse, has ordered another of the same pattern to be placed on the same mine as soon as possible. Gov. Waterhouse has now several of these mills running to his entire satisfaction.

San Luis Obispo.

COAL AND SILVER. — Santa Margarita *Times*, Sept. 20: Uncle Sam Epperly came in from the Avenales this week and reports the prospects brighter than ever for that locality. Mr. Epperly has great faith in the coal deposits of the Avenales, and it is their remoteness from the railroad that prevents the deposits from creating a general coal boom. On his mine up in Biddlecomb canyon he has sunk down on the coal ledge to the depth of 14 feet, and has come in contact with two more veins; the three veins are two inches wide each and are blending together in one or two places. The silver quartz ledge is more of a float than a ledge, but the ledge is there if float is any indication. The float quartz is pretty rich, and assays $3.72½ to the ton. Three blasts have been made in the crest of the ledge. The mine is about 100 feet off the Garcia trail.

Shasta.

TELLURIUM.—Shasta *Democrat*, Sept. 20: Peter Scherer has resumed work on the Tellurium mine. Last week he pumped the main shaft dry and started to sink. The shaft is down 125 feet, and at that depth the ledge is 2½ feet wide, with about five feet of ledge matter between walls. The ore extracted carries considerable free gold, also rich tellurium sulphurets.

MAMMOTH.—Edward Lisle and a gentleman by the name of Wells, both representatives, and the latter private secretary of John W. Mackay, made a hurried visit to the old Mammoth mine, in Old Diggins district, last Sunday, and that evening boarded the overland train, homeward bound, with a large number of samples from the mine. They were very seclusive and uncommunicative while here, but their visit to the Mammoth has caused much gossip among the mining fraternity. It would be a streak of good luck for the mining interests of this county to have the king of the bonanza mining firm invest in some of our mining property.

Sierra.

LOGANVILLE.—*Mountain Messenger*, Sept. 21: The pump at the Marguerite mine was started yesterday and works to the entire satisfaction of all. At a stroke of six to the minute it lowers the water a foot an hour. The pump is one built and put up by Mr. Knight of Sutter creek. It is a 17-inch pump with a 7-foot 9-inch stroke. It is at present throwing near 300 feet and can be run at the rate of 15 strokes a minute.

Siskiyou.

MEDICINE LAKE COUNTRY.—McCloud *Pioneer*, Sept. 21: It is reported that one of a party from Bartle and Fall River struck a rich gold mine up in the Medicine lake country, but as the scene of the discovery is about 40 miles from water, and the climate very cold, there is little probability of the find ever amounting to anything. However, it is said that a couple of capitalists of a banking and real estate firm at the city, who were stopping here looking for timberland investments, talk of organizing a stock company to purchase, and if practicable, to work the mine. Samples of the rock were sent to a prominent assayer below who pronounced it a conglomeration of stuff common to the Medicine lake country, the gold showing up in chunks and patches over the white quartz. The other members of the party generously renounced all claim to the find, leaving the Fall River discoverer in full possession of the mine.

QUARTZ AND RIVER MINES.—Yreka *Journal*, Sept. 25: The richest crushing of quartz yet realized on Humbug is now being made from the Spencer ledge, consisting of 50 tons, believed to be $100 ore, on an average, judging from prospects made. Boyle & Co. are laying about 1000 feet of iron pipe from a spring on top of the mountain to their quartz ledge at north fork, so as to have water for drinking purposes and general use at the mine. This company has already expended a large amount of money in making improvements at both mine and mill. The cool weather of past few days with the cool evenings, has caused the water to come up in the ground from the bedrock and springs, and with a little rain, some of the dried-up creeks will afford running water again to prove highly beneficial to the miners. The river miners at the Klamath are now crowding their work with energy and good success, and will take out great quantities of the glittering dust until the winter freshets of December oblige them to suspend operations.

Solano.

THE ST. JOHN MINE.—Benicia *Era*, Sept. 21: Owing to a recent rise in the price of quicksilver, D. W. Harrier, owner of the St. John mine, has decided to crush the ore easily reached, and for this purpose has put a force of men at work clearing out the main tunnel, under charge of Mr. Wills, a former superintendent of the mine. The whole county about is so rich with quicksilver that at any time there is profit in working the loose material without even entering upon the principal lode. The mine has been idle for some time, but the clearing out of the tunnel is not so difficult a job as it was at first expected to be.

Trinity.

BIG MINING SCHEME.—Redding *Free Press*, Sept. 21: We are informed by reliable parties that there is a big gravel-mining scheme on foot, and if put into execution will do much for Trinity county and Redding. An English company has succeeded in bonding the gravel mines of Trinity Center and all the gold-bearing lands including the town-site. The mines included are the Sikes, Center, Zarli, Brush Creek, Coyle, Elevator and Rumfelt. The ditches taking water out of Swift, Brush and Buckeye creeks will be enlarged and the latest improved machinery used. Trinity Center is one of the richest gravel deposits in the State, and the capital that will be forthcoming will open it up and make things decidedly lively. This district does not come under the ban of hydraulic mining, as the slickens do not interfere with any one.

NEVADA.

Washoe District.

UTAH.—Virginia *Chronicle*, Sept. 21: On the 600 level the north lateral drift from the main west drift is advanced 633 feet; formation vein porphyry and quartz, showing value.

OCCIDENTAL CON.—During the week extracted and milled 328 tons of ore showing an average assay value of $17.45 per ton.

BEST & BELCHER.—On the 550 level, the northwest drift is extended 147 feet. Formation porphyry and clay with streaks of quartz. On the 1000 level the northwest drift is extended 260 feet. Formation porphyry with streaks of quartz.

NORTH OCCIDENTAL.—Continue stoping ore from the 450 level.

SIERRA NEVADA.—On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 135 feet. Formation porphyry with some water.

UNION CON.—On the 1465 level, the north lateral drift is advanced 417 feet from the south line, continuing in porphyry and clay.

MEXICAN.—On the 1465 level the north drift from the west crosscut No. 1, 200 feet in from the lateral drift, is advanced 384 feet, continuing in porphyry and lines of quartz.

OPHIR.—On the 1300 level the east crosscut from the shaft station, to connect with the top of the raise above the 1465 level east drift, is extended 118 feet, face continuing in porphyry.

CON. CAL. & VIRGINIA.—The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. On the 1435 level from the bottom of the winze sunk below the south drift from the Ophir line, an east drift is advanced 72 feet. The face is in quartz of low value. Continue to stope ore of good quality from the point of connection between the northeast drift from the top of upraise No. 2 above the 1600 level. During the week 1072 tons and 970 pounds of ore were shipped to the Morgan mill, 1052 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $27.95. Shipped during the week bullion valued at $45,238.72 to the Carson mint. Bullion valued at about $12,000 on hand.

GOULD & CURRY.—On the 400 level west crosscut No. 1 is extended 322 feet. Formation porphyry.

EAST SIERRA NEVADA.—The 520 level south drift is out 88 feet and continues in porphyry.

ANDES.—The 350 level west drift is showing quartz.

SCORPION.—The 520 level south drift continues.

SAVAGE. — The upraise above the 500 level west drift continues in ore.

HALE & NORCROSS.—West crosscuts Nos. 1 and 2 on the 300 level continue in low-grade quartz. Preparing to resume operations on the 1200 level.

CHOLLAR.—Usual progress is made in advancing 650, 750 and 850 level explorations, without any change in formation from last report. The winze below the 200 level continues in low-grade quartz.

POTOSI.—The 850 level south drift is penetrating vein porphyry.

IMPERIAL.—A winze is being sunk below the 300 level from which a drift will be run to connect with the shaft for an airway.

WARD COMBINATION SHAFT. — The work of excavating a station on the 1050 level is being pushed to completion and a west drift will be started next week.

ALPHA.—The 382 level east crosscut continues in low-grade quartz. The shaft is down 45 feet below the 500 level.

EXCHEQUER.—Usual progress made in advancing 382 level explorations without change in formation.

YELLOW JACKET.—The 500 level west drift is out 670 feet. The daily ore shipments average 50 tons, and will be increased to 100 tons next month.

CONFIDENCE & CHALLENGE.—The 500 level joint Imperial north drift is out 950 feet from the Yellow Jacket shaft and continues in quartz and porphyry. The east crosscut from this drift is in clay and porphyry.

OVERMAN.—The north drift from the winze bottom is out 85 feet.

CROWN POINT. — The 700 level south drift is out 240 feet and has entered quartz assaying from $8 to $15 per ton. The 600 level east drift cut through an old lateral drift where it entered quartz giving low assays in gold.

BELCHER.—Have started an east crosscut from the winze bottom on the 1200 level, The 200 level west crosscut is in porphyry and clay.

SEG. BELCHER.—The 1100 level east crosscut is showing seams of quartz.

CALEDONIA.—Laying car tracks and advancing explorations on the upper levels.

JUSTICE.—The usual grade and quantity of ore crushed at the mill.

ALTA.—The ore now extracted from the 925 level stopes is showing improvement. The mill is running as usual.

NEW YORK CON. — A large amount of ore is stripped between the 600 and 800 levels, and preparations for crushing it at the Douglass mill are in progress.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—Advancing a northwest drift to connect the workings. Repairs in progress at various points.

Cherry Creek District.

ORE STRINGER.—White Pine *News*, Sept. 21: A stringer of ore has been struck in the old Star mine at Cherry Creek that goes $1200 to the ton. It is being followed and may develop into a large ore body.

Kirman District

GRAVEL.—Virginia *Chronicle*, Sept. 18: A gravel bed has recently been discovered near the Norrie mine which the locators say carries enough coarse gold to pay handsomely if free water was available to wash it by the sluicing process. Several grains the size of small bird shot were obtained by the panning process. The locators will work the gravel by the rocker process next spring when a sufficient flow of water from melting snow is obtainable. The gravel bed is located on the plateau east of the head of Crown Point ravine and is several hundred feet higher than C street.

Pioche District.

RAYMOND SHAFT. — Pioche *Record*, Sept. 18: Since our last mention of work at the Raymond shaft the 12th level has been cleared and timbered to the Black winze station, which is about 1500 feet from the shaft. The whole station is caved down and the work of getting through it is laborious and necessarily slow. The winze itself is not yet reached. It was expected that the upper workings of the Black Ledge could be entered from the winze station after a few days work in removing debris, but this was found impossible, and last Tuesday an ascent was made through an old winze which is 100 feet from the Black winze crosscut and nearer the shaft. A 60-foot stope was found with an abundance of ore in place from which samples were taken. The stope was caved and on this account explorations were

somewhat limited. The assay from the samples taken was highly satisfactory to the parties interested. The winze station will probably be cleared in a week or two, when other portions of the Black Ledge can be examined.

THE PIOCHE CON. has for some time been running a prospect tunnel into the mountain from a point about 100 feet east of the Raymond works. The object was to strike the manganese vein which crops out on the surface on the divide above. Last Tuesday the ledge was entered and a fine showing made. The ledge where struck is several feet in width, and is interspersed with large chunks of galena. The walls are well defined and everything indicates the presence of ore.

Red Canyon District.

RED CLOUD.—Virginia *Chronicle*, Sept. 18: Ore is being extracted from the Red Cloud mine in Red Canyon district, Douglas county, which it is expected will produce $100 per ton in gold. The district is noted for pockets of gold-bearing quartz, and a divining-rod disciple is now there who claims he can locate hidden pockets of the yellow metal with unerring certainty with his magic willow wand.

Robinson District.

MILL RUN.—White Pine *News*, Sept. 22: A. R. Watson has leased the Ely mill and will make a run on ore from his mine in Robinson. From samples of gold pounded out of a few pounds of the rock, which we have seen, the ore must be very rich, and Mr. Watson can hardly fail to make a success of the run. Such splendid showing of gold ore in a mine anywhere else than in White Pine would cause no little excitement.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Sept. 20: North drift, 250-foot level, extended 15 feet.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 15 feet, and a station set of timbers has been put in at the 500-foot level.

GRAND PRIZE.—Water is now down within 8 feet of the 500-foot level station floor. Concentrator running steadily and doing good work.

NAVAJO.—The crosscut from the end of the south drift, 350-foot level, extended 16 feet. Upraise south end, same level, extended 7 feet. Vein is considerably wider with streaks of rich ore through it.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 13 feet. There is a slight increase in the flow of water. Main south drift, 100-foot level, extended 16 feet. Face looks about the same as at last report.

DEL MONTE.—Joint crosscut, 225 level, extended 13 feet, showing some more water. Main north drift, 100-foot level, extended 14 feet. The face continues in ore.

COMMONWEALTH.—100-foot level; No. 14 north drift, from No. 13 west crosscut, has been extended 19 feet; drift all in the vein; face showing some good ore. No. 5 east crosscut, from No. 7 south drift, extended 17 feet, passing through some stringers of ore. 150-foot level: South intermediate drift, from top of No. 15 chute, extended four feet; face showing high-grade ore.

ARIZONA.

MOHAVE NOTES.—*Miner* Sept. 21: A new shaft will be sunk on the Gold Back mine, Chloride, about 150 feet from the old one. The Keystone mill has "hung up," they having run through all their tailings that would pay. The Tintic mine, Chloride, is still producing a good grade of gold ore and will make a 15-ton shipment in a few days. Marshall & Jamison are taking out some fine gold ore from the Jamison mine, Layne Springs. Crosscutting has been commenced by the Keystone Co., Mineral Park, from the 50-foot level of the Congress shaft. The lessees of the Crescent mine, Messrs. Miller, Hitchcock and Grant, in the Peacock mountains, are doing exceedingly well, having a fine body of high-grade ore opened up. The Monarch M. & M. Co. have sold their mill at Lost Basin to the Rattan Co., who will immediately proceed to erect the same on the river near the Rattan mine. The A. & P. railroad have issued a new freight tariff on ore in lots of not less than 10 tons from Daggett to Kingman. The rate is $2.50 per ton from Daggett; Fenner, $1.50; Needles, $1.25; Powell and Yucca, $1.20; Drake, 80 cents. This is a much lower rate than formerly, and is an inducement for miners to ship ore to this place. At the sampling works during the past week the following lots have been run: Six carloads of the C. O. D. have been shipped and four more await working, nearly all the output of that mine last month; American Flag, small lot; Harris & Robinson, lessees C. O. D., a small lot of high-grade ore. The strike stopped the shipments of ore, but the ores accumulated are being loaded as fast as cars can be procured.

NIGHTHAWK.—Supt. Bowers of the Nighthawk mine will soon leave for California to confer with his co-owners in regard to erecting machinery on this mine. The water has not increased with the depth of the mine, but the distance it has to be raised makes it impossible to sink deeper without steam. The north and south drifts from the bottom of the north winze have been driven 30 feet each and both are and have been in fine ore, and the amount of high-grade ore at present in sight will require about two months to stope out. All indications point that these drifts have tapped the apex of the largest and richest body of ore yet encountered in this phenomenally rich mine.

CASTLE CREEK.—Arizona *Journal-Miner*, Sept. 20: Castle Creek mining district, located about 54 miles south of Prescott, so far as the general formation is concerned, as well as the showing made from development of properties, gives promise of becoming one of the bullion-producers of the Territory. A smelter, brought in at heavy expense and constructed on the banks of Castle creek, has lain idle for several years, through lack of ores to smelt. It was originally intended to smelt ores of the district which showed up a good percentage of copper, but from some cause or other a failure was scored. The failure of this smelting proposition, like any failure of a mining enterprise, gave the district a backset for some time, but it is now coming into prominence again through new blood and new men taking hold of properties and working them, as well as by some of the old claim owners, who have never lost faith in the district and who have held on to their claims and are working to develop them. Mr. Barrett is interested with Frank Ruggles, James Roach and J. J. Patton in a number of claims, three of which they are working, viz.: the Mammoth, formerly called the Copperopolis, the Melinda Jane, and the American. The former was at one time worked as a copper mine, but after the failure of the smelter was abandoned, and afterward relocated. It is opened up by nearly 500 feet of tunnels, drifts, shafts, and winzes. The vein is a very strong one, being from six to ten feet wide. The ore carries gold and from five to ten per cent copper. The mine is located in a gulch tributary to Castle creek, where running water is found eight or nine months in the year. The location of the Melinda Jane is west of the Mammoth. Only a few shallow openings have been made along the ledge, the deepest being from eight to ten feet deep. Wherever the ledge has been prospected it shows remarkably rich lead carbonates carrying some silver.

THE AMERICAN.—This is a gold-bearing ledge about a quarter of a mile northwest of the lead claim. This, like the Mammoth, is also a strong vein, and horn-spoons even better than the ore from the latter. A shaft about 70 feet deep has been sunk, and about 40 feet from it another 30 feet deep. These mines are located about two and a half or three miles from the Castle creek smelter, there being a good wagon-road to them.

PURCHASE.—*Silver Belt*, Sept. 21: Mr. Fitzgerald of the International Smelting Co. of El Paso, who recently purchased the Defiance mine in the Turquoise mountains, 30 miles south of Wilcox, states that the mine is to be worked and shipments of ore to El Paso begun immediately. The ore contains about 30 ounces of silver and 30 per cent lead per ton. The sale of this mine is the result of enforcing the payment of duty on Mexican lead ores. Mr. Fitzgerald is negotiating for the purchase of a lead property in Yuma county.

COLORADO.

NO ORE SHIPMENTS.—Elk Mountain *Pilot*, Sept. 20: There is nothing especially new of importance in mining circles here. No ore shipments in our weekly shipping report is a sad state of affairs that there seems to be no help for at the present time. However, there is considerable quiet development going on in different directions that will ultimately lead to our prosperity. The vicinity of the Iron Swamp is still attracting attention and considerable development is being done. A report comes of a gold discovery in the vicinity of Pittsburg. Scott Humason made the discovery, and while we do not know where it is we believe it must be on the west slope of Baldy mountain, the same being the head of Washington gulch. Gold-hunters have for years prospected for the vein from which the placer gold comes. The Augusta concentrator has not got to running smooth yet. Like all mills of the character, it requires experience, patience and perseverance to make a go of it. A Colorado Springs company owns, with Lew Wait, the Voice and Expectation claims, situated in Maroon basin. Mr. Wait will let a contract for 60 feet of work to be done this fall, and hopes to show up an improvement by that development.

SILVER CREEK.—Silver City *Enterprise*, Sept. 21: Frank Vingo, from Silver creek, has for some weeks past been supplying the Sheridan mill with ore from his mine, which mills on an average $30 per ton in silver and gold. At the present time the mill is running 100 tons of ore from the Last Chance, owned by Johnson & Conroy, which will turn out well. As soon as Mr. Vingo gets his new whim in place he will be able to keep the 15-stamp mill running on ore from his mine. The ore body averages from 4½ to 9 feet in width, and is of such a uniform value as to require no sorting. The ore is hauled over the new road a short distance to the Sheridan tram by means of which it is lowered to the mill. The ore is easily milled.

DAKOTA.

PLACERS.—Deadwood *Pioneer*, Sept. 20: Wm. Dunn is placer mining on Strawberry about the Oro Fino and taking out good pay. The gold is coarse and many fine nuggets are found.

PYRITIC SMELTING.—News from the Iron Hill is decidedly encouraging. The smelter was in blast Monday afternoon. Last night reports received by telephone were to effect that everything was working to a charm. One statement was that 75 tons of ore were being put through each 24 hours; this must have been a mistake, however, as the plant has a capacity of but 50 tons. Slag pots are kept constantly full. At present it looks as though the process were an unqualified success.

THE ALBE.—Albe Holmes, in from Carbonate, states there is at present a good deal of mining activity in the camp. The Hartshorn, Spanish R., Iron Hill, Seabury and others are working forces, developing their several properties. Seabury and Spanish R. are steady shippers. On his own claim, the Albe, he is engaged in sinking a new shaft 4x6 in the clear. This is now down 92 feet. When a depth of 100 feet is attained a station will be cut, and drifting for an ore body probably begun, though it is possible the shaft will be sunk to the 150 level before a drift is started.

ORE SHIPMENTS.—Shipments of Golden Reward ore to Omaha, from the dump at the reduction works, continue regularly. Northwestern teams took down a carload yesterday.

IDAHO.

MULDOON.—Wood River *Times*, Sept. 18: Wm. Conners and S. J. Winchester are in from Muldoon attending to the sampling of an ore shipment from the Jupiter and Bay State. If this test is satisfactory the boys will make other shipments this fall. The Jupiter has sent to market 25 tons up to date and has now 3½ feet of ore in the deepest workings. The output of these mines samples from 125 ounces silver and 73 per cent lead to 70 ounces silver and 35 per cent lead. The boys report that their camp is full of low-grade ore, but needs and must have cheap transportation before it will see prosperous days. The Bob Ingersoll is cut into by a tunnel 214 feet. The ore in this mine lays in chutes, five of them having been intersected by the tunnel. The Rippetoe is another promising property in that camp. The ledge is opened by two shafts, one 54 and the other 34 feet deep, and a great number of cuts. The ledge shows ore wherever opened for 600 feet from two to three feet thick, and worth 70 ounces silver and 50 per cent lead per ton. The Tom Payne is a continuation of the same vein but carries a better grade of ore.

COEUR D'ALENE.—Cor. *Oregonian*, Sept. 20: Work is going on in nearly all the mines on Sunset, the Portland M. Co. having started up a few days past. The Goat and Virginia are pushing development and fine ore is reported from both places. A new strike is reported below the Wild Goose, near Toole's spring, a three-foot ledge of carbonates having been opened up. On the Parrot and Colwyn fine bodies of ore are exposed, and some of it is very rich. The Toughnut and Tuscombia are looking splendid, the Toughnut especially, the owners having struck a fine body of high-grade galena ore lately that will pay to ship when the road reaches here. On Nine Mile the California is shipping right along, and some of the others are getting ready to. The Pan Handle is looking fine and promises well with development. The Custer is going ahead and sending along plenty of $100 ore. At Burke the Poorman has declared its second dividend of $20,000, which speaks volumes. The Tiger is "roaring away" quietly. The lower tunnel on the Diamond Hitch has been driven into good ore and the owners are jubilant. The San Francisco and Black Bear are doing splendid in the way of development, large bodies of ore being exposed in nearly all these workings. At the Gem everything is bustle and activity; the concentrator is in shape and running, and the ore is coming therefrom cleanly dressed and ready for market. At the Belle the owners are pushing work on the tunnel, and have a large ledge with plenty of good concentrating ore, while above, at Gray's tunnel, they expect to start up almost any day. The Granite keeps up its lick and carload after carload goes out to market. Considerable work is going on at Placer creek and many fine showings are reported. At Mullan, Charles Hussey has purchased the Evening, and started up his concentrator, which means another hundred tons of ore per day. A great deal of work is going on up there and many miners are employed. Over on the North Side Major Hopkins is developing the Frank Reed property, and report says it is a bonanza. The Mills placers are taking out gold by the pound, so I was told when last at Eagle, a few days ago, while the Golden King and the Golden King mill are working right along on good pay rock, and it is the same with the Golden Chest. The Ophir Hill group are doing well with their arastras, and every week nice bars of bullion are shipped away to Helena, the product of its rich ores. Up near the head of Prichard creek some fine carbonates have been discovered, and many locations have been made this season that promise well for the future. At Myrtle the placers are doing fairly well. They are short of water, but are employing about 30 men. At Pony gulch the Fay Templeton folks are making good large cleanups, the one last week netting close on to $2000.

PRIDE OF IDAHO.—Ketchum *Keystone*, Sept. 21: We were shown a certificate of an assay made last Wednesday of samples of ore from the Pride of Idaho mine at East Fork, which gave the following result: First-class, 175 ounces silver, $7 gold and 62 20-100 per cent lead per ton. Second-class assayed 40 80-100 ounces silver, $7.50 gold and 55 75-100 per cent lead per ton. The latter class of ore Jim Davison says he has been lately throwing over the dump, not knowing the value of it. Mulkey, Taylor and Stuart are working the Olympia mine situated in Bassett gulch, under a lease, and report the prospects very encouraging. Mr. N. C. Barney and son, Alex Simpson and Major Cavanah returned on Tuesday from the Ross valley mines. Major Cavanah speaks very highly of the future prospect of these mines, owned by the Cumberland Mining Co. The most feasible route to the mining property above mentioned is by the way of Ketchum. Ross valley is situated about 10 miles from Sawtooth, from which place a good practical road can be made with but little expense. Ketchum is the nearest point on the railroad to these mines.

LOWER CALIFORNIA.

CLEANUP.—One of the Huntington mills was this month sent to the International Co.'s mines, Alamo, Lower California, and F. S. Sutherland, the superintendent, writes as follows concerning it: "Our 5-foot mill started up on the 12th inst., with Harry Ayres in charge. It runs like a clock, and after five days' work we cleaned up $2160, saving fully 90 per cent on the mill. Very little got on to the plates. We are greatly pleased, and many people who were before prejudiced are now warm in its praise."

BRICKS OF GOLD.—San Diego *Sun*, Sept. 21: Among the passengers on this morning's steamer was L. B. Howard of the Occidental mine near Real del Castillo. Mr. Howard brought up with him a gold brick valued at $3000, which is the yield of a few days' run. This makes $14,000 in gold which the Occident mine has yielded within the past three or four months. Mr. Howard asserts that mining prospects never looked brighter. F. G. Suterland, manager of the International Co.'s mines at Alamo, is in the city. He brought up a $2600 gold brick, the result of the first cleanup from the new mill.

MONTANA.

BIG MINING SALES.—Butte *Miner*, Sept. 21: Great though she is, Montana is still in her infancy, as pertains to the development of her wonderful mining resources, as almost daily some striking proof of this is presented. Tuesday the well-known mine-owner of Southern Montana, Mr. Phil Shenon, sold a group of gold mines at Bannack, Beaverhead county, to the Carlisle Mining Co. of London, England. The consideration is said to be $175,000, and the first payment has been made and a deed in escrow deposited with Clark & Larabie of this city. The company will at once erect extensive works, and Bannack will receive such a lease of life as she hasn't felt since in early days when she was the capital of Montana. As we go to press a special from Bozeman tells of the sale of the Golconda mine, owned by Olds & Hickman, to Cleveland parties for $150,000. A pretty good record for one day.

THE NEW SMELTER.—*Inter-Mountain*, Sept. 21: The coming week will witness a new smelter of the Silver Bow Co. coming into active use. It is located in a very convenient and desirable locality for the mine, and is no doubt the forerunner of a much larger plant. The ore from one level of the Silver Bow mine would keep that smelter concern of only 100 tons capacity in full operation for some time to come, not taking into consideration the other immense properties of the company in the district that could keep just a dozen of its caliber busy all the time.

OPERATIONS AT ANACONDA.—The new smelter at Anaconda, or at least the best part of it, will be in operation in about a month. A tall stack for the purpose of taking all the smoke from the old smelter is being erected on the pinnacle of the mountain. Its present hight is 180 feet, but work will continue till it has reached a distance of 220 feet above the ground. It is 40 feet in diameter at the base. The smoke will then be taken high over the adjoining mountains and not settle down in the city as it occasionally does at present. A stack similar in size will be erected at the lower works of Carroll in addition to the one now in use. Ground has been broken for the new foundry the company is about to erect, that will be built east of town near the foothills. These works will have all the improvements of a first-class foundry, and when finished will be the most complete of their kind in the Territory. At Anaconda a contract has been let to construct a sewer to run through the city in consideration of the sum of $25,000, and ground has already been broken. The sewer will empty into the tailings ditch from the smelter that it may not contaminate the waters of Warm Springs creek.

LOTS OF MEN EMPLOYED.—As for the other mines, it may be said the Anaconda Co. and the Chambers syndicate belt of mines are to-day giving employment to more men than ever before in their history and at and in every conceivable position.

NEW MEXICO.

WITH A HAND MORTAR.—Silver City *Enterprise*, Sept. 21: Harry Apple, formerly of this city, who has a mine in Sierra county, adjoining that of John Fessler, mentioned in this paper last week as taking out $30,000 in a hand mortar, is in a fair way to grow wealthy from his little property. In five months he has taken out $18,000 with one man besides himself. Like Fessler, his mill is a hand mortar, and it is just the thing for such ore.

BREMEN.—Manuel Taylor and partner, who have been working on leased ground in the Baltic for the past eight months, on Thursday of last week struck a body of ore which promises to make them wealthy men. They are now taking out great boulders of ore. McDonald & Stanley, who have the Wagner mill under lease, are now running on ore from the Skillicorn mine, and are saving 85 to 90 per cent of the metal and making a concentrate worth $75 per ton. The mill is doing remarkably well. A new hoist has been ordered for the mine.

STRIKE ON THE COMSTOCK.—The Comstock promises to eclipse herself and help to give Kingston another boom "bigger than the other." A large body of the richest ore ever found in the mine was uncovered last week by F. P. Seidlitz, who has a lease on the south end of the claim, adjoining the Deadwood. Much of it runs into the thousands and covers the whole face of the drift. Three other leasers are also working in ore, and the owners themselves have been constantly taking out and shipping ore for months, or years, as far as that goes. This Comstock strike is certainly the largest we have had in years, if what those say who have seen it is true, yet it creates but little excitement, not so much as the rumor which was circulated last week of the finding of Adams' diggings.

UTAH.

PARK NOTES.—*Record*, Sept. 21: The boiler at the Woodside's new shaft has been set and the hoisting engine is expected to arrive in a day or two. The ore body is holding its own both as to magnitude and richness, and it is pitching downward with every indication of permanency.

THE STEAMBOAT GROUP.—This group, consisting of several new locations way up at the head of Snake Creek district where the Cottonwoods and American Fork meet, is being developed by a force of men under Contractor Springer of Midway. The property is owned by Berry Brothers, Kimball Brothers and other Parkites who propose to run the tunnel until it cuts some of the big ledges known to run through that part of the great mineralized belt.

THE TUNNELS.—The Alliance drain tunnel is in a distance of about 1200 feet, or nearly one-fourth of the entire length to be run. The Ontario three-mile drain tunnel has reached about 2500 feet and satisfactory progress is being made. The McCune tunnel, which is in nearly 1500 feet, still yields a big flow of water and the track is being raised to permit an unobstructed outward flow.

CAMP CROSSCUTS.—The Union concentrator is now working on Alliance second-class ore. First-class ore shipments from the Crescent were resumed to-day, the tramway being in successful operation again. A local geologist and mining expert is seeing his prediction verified. He foretold, when people disregarded his theory, that millions of tons of rich carbonate ore would be extracted from the lime belt up Woodside gulch way.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 80,000 pounds of concentrates. No bullion or sulphides were produced at the Marsac mill this week. The output of Ontario bullion for the week was 31 bars, containing 16,270 fine ounces of silver. For the week just ended the Mackintosh sampler received and forwarded 378,600 pounds of Ontario ore; 308,600 of Daly; 120,700 pounds of Woodside concentrates from the Union concentrator; 93,500 of Mayflower No. 7 leasers' ore; 76,800 of Woodside first-class ore; 48,700 of Macdonald & Girard's Woodside jiggings, and 26,000 pounds of Flindt & Varcoe's Apex jiggings; total, 1,052,900 pounds.

WASHINGTON TERRITORY.

KAOLIN TO BE SHIPPED.—Ellensburg *Capital*, Sept. 20: Walters & Co. have signed a contract to furnish a Tacoma firm kaolin in carload lots, all that may be needed. The deposit is located near Ellensburg and is practically inexhaustible. Its quality is said to be of the very finest and the demand promises to be very great. There is plenty in the Ellensburg deposit to satisfy the demand of the entire Pacific Coast for years to come. Little is known by people generally about kaolin or petunse. It is a variety of clay, used in making porcelain. It proceeds from the decomposition of the mineral feldspar, and is indispensable in the manufacture of fine earthenware.

MECHANICAL PROGRESS.

Positive and Relative Movements in Machinery.

It is a curious fact that while the eye can easily take in the relative motion in a machine, it is almost impossible to get a correct idea of the positive motion of its various parts by simply looking at the machine in motion, and we can only do so by a close application of the mind to the subject. Of course, by relative motion we mean the movement of one part in relation to the other part of the machine, and by positive motion the movement of its parts through space. For example, says a writer in the *Tradesman*, take some of the principal moving parts of the locomotive. The movement of these parts as seen by the eye seems to be the same as in a stationary engine. The follower head moves backward and forward from end to end in the cylinder, the crosshead moves back and forward in its guides, traveling each way the full length of the stroke, and the wrist pin on the driving wheel seems to move in a circle around the center of the wheel, and all of this is true as to the relative motion of these parts. But if we stop here we certainly have no correct idea of the true or positive motion of these parts, for in reality the follower head moves forward to the front end of the cylinder, where it does not stop entirely, but only moves slower until the cylinder is drawn forward over it, when it again darts forward to the front end of the cylinder, as at first, but it never moves backward one particle unless the engine is running backward. The crosshead, of course, has the same positive movement in its guides as the follower head in the cylinder. The wrist-pin on the driving wheel, instead of moving around in a circle, only moves over the segment of a circle, whose length and degree of curvature is determined by the size of the driving wheel and the distance of the wrist pin from the center. This complication of movement is found to a greater or less extent in almost all kinds of machinery. Wherever a moving part of a machine carries with it another part, which has an independent movement of its own, there is both positive and relative motion. Therefore, if the operator would thoroughly understand the machine in his charge so as to get the best results from it, he must not be satisfied with merely watching the relative movement of its various parts, but he must study the positive movement of its parts as well, for, many times, when the machine refuses to perform its work, he looks it over and fails to see anything wrong, and if he has not studied all of its movements, there is much worry and loss of time before the trouble is found, and even then it may take considerable time to get it properly adjusted, because he does not understand the exact movement it should make to properly perform its work.

For the student of mechanical science I know of nothing more interesting and profitable than a close and careful study of positive and relative motion in machinery, both in their separate functions and in relation to each other.

The Blacksmith in Danger.

Machinery has so far superseded hand work in the blacksmith shop that the blacksmith is nearly reduced to horseshoeing for support. This is but the inevitable progress of the age. Our cotemporary of the *Industrial World* in alluding to this matter says: Invention and discovery have accomplished a multitude of beneficial wonders, yet some harm, at least of a temporary sort, is mixed with the good in frequent cases. The invention of printing destroyed the occupation of the copyist; the invention of the power-loom gave the death-blow to employment for hand-loom weavers; and automatic machinery in new lines of industry is constantly modifying, sometimes revolutionizing, the condition of certain classes of laborers. This tendency has long been at work, in a partial way, narrowing the essential qualifications of the blacksmith. Once he needed skill to make horseshoes, horseshoe nails, and sometimes part of his simpler tools. His spare hours used to be occupied in producing a supply of these requisites of his trade. Now they are manufactured by machines, they constitute separate and independent branches of business, and they are furnished ready-made to the hand of the smith, better, far cheaper, more serviceable, than they could be made in the shop. Again he is threatened by innovation, this time vitally. A recent number of London *Engineering* refers to a system of adjustable horseshoes without nails about to be introduced in England, and says: "Again and again new forms of shoes have been put forward, but they were as often pronounced faulty in some essential. It is requisite that a horseshoe that can be applied without the skilled labor of the farrier should be easily adjustable, should require the use of no special tools, should be anatomically suited to the form of the foot, should entail no inconvenience to the horse in his daily work, and should not be liable to set up new dangers or difficulties, as bad, perhaps, as those it was designed to cure. These requirements, onerous and considerable though they undoubtedly appear, have been fully met by a new system of horseshoe." English need of such a contrivance is far greater than American need; for, as a rule, English horseshoeing is a diabolical sort of bungle, superfluously large and cumbersome shoes, secured to the hoofs by nails ungainly in appearance and weighty with metal, by which the horny substance is shattered or split, and the foot at length diseased. Capable veterinary surgeons have estimated that 25 in every 1000 horses in England die some ten years before their time, as a result of lockjaw or other damage inflicted in the process of shoeing. Indeed, the light shoes and dainty nails used by American blacksmiths are the scorn and derision of English farriers, who regard these articles as mere toys compared with their own.

The bare idea of a horseshoe without nails is not new. Ages ago the Japanese made such shoes of straw. Of course, they were not durable, but they seemed to answer the purpose, for they were customary. An adjustable shoe, embodying the same idea on higher principles, would, no doubt, cheapen the keep and increase the working power of horses. A large sum for nails, and loss of time, with cost of attendance to and from the smithy, would be saved. *Engineering* estimates the single item of loss of horse service, in consequence of the necessities of shoeing once a month, at not less than £6,450,000 per annum in England and Wales alone. The aggregate annual earnings of 125,000 farriers are put by the same authority at £6,250,000. Such statistical reckoning must, however, be largely guesswork, because the mere estimater, in making his calculation, is likely to omit important elements of the problem.

If this invention should turn out to be a practical success it must lead to improvements in itself and to other devices of different kinds, with the same end in view. The aggregate result would be to wipe the blacksmith out of existence, just as the hand-weaver has been wiped out. Herein is exemplified the lamentable part of the outcome of inventions which substitute automatic processes for skilled manipulation. The trained mechanic is thereby often reduced to the level of the manual day laborer; nay, even below the level, when a boy or girl is able, after a few hours or days of instruction, to accomplish, in better form, with infinitely greater rapidity, his productive task. In late years this retrograde effect has involved so many classes of mechanics, and inventive genius is becoming so revolutionary in method, that the growing tendency presents a question for political economists.

MULTIPLE STEAM ENGINES.—The movement in favor of multiple cylinder engines is progressing with rapid strides, and nearly all of the new steam mills where power is the prime consideration are placing engines of this description. Many of the existing plants are also being remodeled on a compound or multiple expansion basis. In Fall River the movement is very general, and the shops have a number in process of erection in that city. A notable example will be the engine of the Fall River Iron Works, which will have six cylinders, three on each end of the crank-shaft, running triple. They are also building a number of triples in which four cylinders are used, the final expansion taking place in two smaller instead of one large cylinder. The Narragansett and Richard Borden Mills have engines of this type, the high-pressure cylinder being 20 inches in diameter, the intermediate, 34, and the two largest each 36, with a three-feet stroke. The triple expansion at the Narragansett Electrical Station is well along in the process of erection. William Cramp & Sons of Philadelphia have contracted to build an iron steamer with triple expansion engines for the Metropolitan Steamship Co., the model to be similar to that of three steamers already on the Boston line.

MANUFACTURE OF LARGE SHAFTS.—The history of the manufacture of large shafts is typical. The contracts for the shafts of the Dolphin, Atlanta, Boston, and Chicago, which were to be of steel, had to be modified to allow of the use of iron. For those of the Charleston, the Baltimore, Yorktown, and Vesuvius, recourse was had to foreign makers. The nine-inch steel shaft of the Petrel was forged by the Duquesne Steel Co. Bethlehem undertook those of the Newark, Philadelphia, San Francisco and Maine, and Midvale those of the Concord, Bennington and Monadnock. In large steel castings for stems and stern posts for the later ships, the Standard Steel Casting Co. of Thurlow, Pa., and the Union Iron Works and Pacific Rolling Mills of San Francisco, succeeded in meeting the rigid requirements.

OIL SHIPMENTS across the ocean in bulk affect the iron trade by checking the demand for barrels. It is stated that there are not one-tenth of the barrels made for oil shipments in this country now that there were formerly. Then the daily shipments of barrels were between 45,000 and 50,000, and for such an amount it would take over 250 tons of hoops. A set of six hoops for an export barrel weighs 12, and on a domestic one, 10 pounds. This was enough to keep two large rolling-mills on double turn.

DEVELOPMENT OF THE ENGLISH STEEL CASTING TRADE.—It is said that there has been a wonderful development in England during the past year of the steel-casting trade. For heavy goods steel has to a very appreciable extent taken the place of wrought and malleable iron. This is a branch of trade into which some houses have gone with great energy and complete success.

SCIENTIFIC PROGRESS.

The Shadow of Electricity.

Every one who has used the telephone to any extent has been much annoyed by a buzzing, crackling noise that seriously interferes with his receiving messages from the opposite end of the circuit. This disturbance is caused by what is known as the induction current, and may not inaptly be termed "the shadow of electricity." It is a sort of faint essence of electricity that hangs about every electric wire, and is affected similarly, but in a lesser degree, by everything that affects the current on the wires. Its strength varies with the intensity of the main current and the condition of the weather, but there is always enough of it to be a nuisance on long wires and when delicate work is desired. It seems to gather up and sling fragments of what is passing over the adjacent electric wires directly into the middle of what you are getting over the telephone wire. The cause of this interference is that the induction from a telegraph wire is so strong that it will overcome entirely the weaker current of a telephone wire near it on the same pole and make it impossible to transmit intelligible sounds over the latter when the former is in use at the same time. This trouble is sometimes so great and persistent as to render the telephone circuit useless.

It will be good news to those who make much use of the telephone that a recent English invention claims to harness this faint current to regular instruments and make it work independently of and simultaneously with the main current on the wire. The main feature of the invention appears to be the use at the receiving instrument of two wires insulated from each other, but each attached at one end to the main wire. The regular current cannot communicate through these wires, because they are insulated from each other, but the induction current exists among them, in spite of the insulation, and any impulse communicated to the induction current at any station on the line is faithfully reflected by the induction current over these two wires at the receiving end. By delicate adjustments, similar to those used in the duplexing and quadruplexing ordinary wires, the impulses of the induction current are kept separate from those of the regular current and will carry a separate message from that passing on the main wire. The instrument by which this is effected is called a phonopore.

It is claimed that it will be possible by the use of the phonopore to double the capacity of an ordinary telegraph wire working singly, by simply attaching the new instrument at each end. A duplex wire can be made quadruplex in a moment by the same operation, and a quadruplex wire sextuplex or octuplex. The phonopore may be hitched on at way stations instead of at the end of the line, and works as well and in perfect independence of the main current. It can be put on at a place where there is no regular instrument. Experiments now being made over English railway lines are said to prove conclusively that the invention is capable of easy and profitable use in connection with existing telegraphic systems.

It does not appear, however, that this new English invention is more than an improvement and perfection of the system of telegraphing from moving trains, which has been in use in this country on the Lehigh Valley railroad for some time, and is said to have proved to be practicable and useful. In both systems the induction from regular telegraph lines is used.

The Microbe of the Magnet.

With all the paraphernalia of the modern physical and electrical laboratory, the instruments of precision that will handle a millionth of an inch as readily as a laborer his pick and shovel; with all the evolution going on through generations of scientists, and the almost incessant wresting of secrets from the bosom of nature, we doubt if science is any closer to the isolation or attenuation of the microbe of the magnet.

It is absurd to suppose that a primary energy is impressed upon a piece of hardened steel once for all. The transfer of that energy into actual work would destroy the magnetic power, yet such a destruction not only does not take place, but the very exercise of the power strengthens the magnet. A horseshoe of steel may be magnetized in ten seconds by the current of a few amperes from a battery, a ridiculously small amount of energy all told, and such magnet can lift many pounds of iron in contact. But without contact it may lift and hold a pound of iron easily. It will hold that pound for an eternity, and every second of that time without end the magnet is expending energy until it foots up an almost inconceivable total of actual power. Not alone that, but the magnet of one pound lifting power to day may and will be stronger to-morrow. Where does all this really tremendous amount of energy come from? By what inscrutable process does the mere magnetization of a bar of steel make of it a machine for the transformation of energy? Not a reactionary or storage device, which, like a steel spring, honestly gives back approximately all it has received, but a perpetual transforming or converting machine. There is a hidden process going on of some kind; energy is going into the magnet all the time it is doing work—energy in some form. Where does it come from—gravity? atmosphere? solar rays? earth currents? Who can say? It is a great problem, worthy of a lifetime of indefatigable research. It is a microbe and it will be discovered, and the discovery will make electricity the queen of nature's forces, and steam will become a dim vision of the dark ages of the past.—*Electrical Review.*

Searching for a Soul.

Materialism cannot furnish a more complete exemplification of its spirit and meaning than it did in the case of the three doctors who sought to discover the secret power of Bishop, the noted mind-reader, at the point of the scalpel in the hands of the operator. They adroitly went at their work before the soul could fairly be supposed to have left the body, apparently in search of the soul itself, as if to question it concerning the mystery of its lodgment and the secret of its control. It might perhaps be regarded as a case of vivisection for the discovery of the spirit before it had taken its leave.

They could have sought for nothing more than material evidences of the spiritual functions in the human body, and thus far, though the circumstances were unparalleled in autopsical history, it has not been disclosed that their strange efforts were rewarded with the least success. They made one thing certain, that the man was dead when they got through with him, which is not generally believed to have been the case when they took him in hand.

The preposterous thing about it is that they should have expected to discover the secret of the phenomenon exhibited by Bishop by an examination of material organs of his body. If they did not expect that, then why make the autopsy at all, and why, of all other things, make it in such haste as to horrify every one who has heard of their conduct?

It is a clear case of materialism probing for the living principle which mere materialism need never hope to find. The method pursued, too, was strictly consistent with materialistic theories. It assumed that in spirit the principle of all life is something that can be handled, measured, weighed and treated after a material fashion.

But, happily for us all, life is something that can neither be comprehended nor investigated in a material way. It is not less real either, because it is so utterly elusive of sense. Man is not so low and mean a being as the animal the materialists believe him to be. There are facts in man's existence which none of the so-called scientific theories can ever hope to explain. The materialists might as well try to see with the ear and hear with the eye as uncover the spirit with the scalpel. And a person blind from birth might as well undertake to deny the existence of light and color as materialists to deny the existence of a soul.—*Boston Globe.*

Power of Mind Over Matter.

One cannot help being amazed when he surveys the marvelous effects that the human mind has brought about. In the struggle between mind and matter, the latter has long held the former in a debased state of ignorance and superstition. Man, the highest and noblest offspring of the Universal Intellect, has bowed in submission and awe before the irresponsible agents of nature, and worshiped them.

But the spark of the Divine finally asserting itself, the thinking-power of man soared above the narrow sphere which bound it, and viewed the unintelligent causes of his dread in their true light. Then commenced the work of subjection. The forces of nature, one after another, came under his control; the god of fire, which the Persians so devoutly adored, was unceremoniously metamorphosed into the steam engine; old Boreas had to give up his rule over the sea, and ceasing to control navigation and commerce, entered, with his co-partner, Neptune, into the misty realms of poetry and song. Jupiter with his thunderbolts, by a transit unparalleled in the pages of history, took the less sublime, though immensely more useful, form of the modern electric motor.

One of the most important achievements of the human mind was the invention of working iron ore into definite shapes, to answer definite purposes. That, together with steam, are the two principal factors which brought about the civilization of the present century. Ah, how little James Watt realized the grand issues of the silver spoon he put to the hub of that teakettle of his! How little he thought he was trifling with the spring that was to raise humanity to the high pedestal it now occupies! But, in all probability, steam is doomed to disuse, for electricity is making rapid and unmistakable strides forward. It is obvious that this new force is destined to throw the old one in the dark, and the twentieth century will doubtless witness a grand and radical revolution in regard to motive-power, which may place it on a much higher level in the path of progress than its most sanguine well-wishers imagine.—*Practical Mechanic.*

CURIOUS NOTE ABOUT OIL PAINTINGS.—A freshly executed painting may have its colors presented in the mellow tones of the old masters by first covering the back with a coating of fuller's earth, which absorbs all remaining oil, and then, on removing it, covering the back with a coat of linseed oil, which the colors presently imbibe. This is the alleged discovery of a celebrated French painter.

GOOD HEALTH.

The Health of the State.

The monthly report of the State Board of Health for August shows a most gratifying condition of the healthfulness throughout the State for that month. Reports were received from 120 localities, showing an average annual death rate of only 11.64, which is said to be the lowest death rate ever recorded in the State, and furnishes a most gratifying evidence that the health organizations under the new law are doing efficient work.

Diphtheria and Croup.

The following remarks in the report under the head of diphtheria and croup should be carefully read and remembered:

"The instrumentality of boards of health in educating the public to the dangerous and contagious nature of this disease, and the necessity of strict isolation and complete disinfection of all persons and things in contact with it, has done much to limit its spread, and to their efficient action may we hope soon to be enabled to chronicle the event of its complete disappearance from our midst, as it is a disease as surely susceptible of perfect extirpation as smallpox, if as efficiently dealt with. To do this promptly, there should be a law to compel a notification of its presence in every instance to the health officer, and the premises quarantined by a distinctive flag or printed notice. If we reflect that diphtheria is more deadly than smallpox and more destructive in its ultimate results, it will be conceded that no measures can be too strong in guarding the public against its inroads."

The report concludes as follows:

As the organization of local boards of health and the appointment of health officers is now being rapidly accomplished in obedience to the State law making such appointments compulsory, we would beg to remind all communities so favored that such organizations or appointments can offer no means of defense against the inroads of disease without the active co-operation of the citizens among whom they are placed. We know that the prosperity of a town depends much upon its healthfulness and the safety of life therein; it therefore becomes most important that upon the first appearance of any infectious disease, its presence should be made known to the officers of health, that all necessary precautions may be taken to prevent in the first instance, its spread; secondly, to discover, if possible, its cause; and, thirdly, to take measures to remove or destroy it. Typhoid fever, smallpox, scarlet fever, and kindred infectious diseases need never extend beyond their original point of development, if properly cared for under the instructions of an intelligent health officer. It, therefore, becomes the highest duty of a citizen to co-operate with the officers of health to save not only the community from sickness and their fellow-citizens from death, but also to preserve the good name of their town for healthfulness and sanitary salubrity. "There is no doubt," says a late writer, "that the people themselves are responsible for many of the diseases which afflict them, and when the art of preserving health shall have attained to the same perfection as the means that now exist for destroying it, we may expect a large reduction in sickness and a willingness to be governed by sanitary rules that are now looked upon by a large class of people as interfering with their personal liberty."

Want of Sleep.

Are you afflicted with insomnia? Perhaps you have too much time for sleep; perhaps you depend too much on sleep for rest and recuperation—for sleep is not the sole rest of used-up nerves. Sociability, congeniality and the enjoyment of good company rest the body quite as much as sleep.

The dreary monotony of life in many a household, involving this tumbling into bed with the mechanical regularity of a machine at 9 or 10 o'clock in the evening, does not always rest weary bodies. "Early to bed and early to rise" does not always make a man healthy, wealthy or wise.

Numbers of organizations are capable of only five or six hours' sleep at a time, and their early lying down to rest is often succeeded by an early waking up and a consequent restless tossing for hours preceding daybreak. The practicers of punctuality are often surprised, after breaking their own cast-iron rules and passing two or three later hours of mirth and jollity past their usual bed-time, to find themselves even more refreshed than usual in the morning. The relaxation of sociability has rested them more than would sleep or an attempt to sleep. But these are conditions not so easily reached in the average family.

In fashionable life we have a formal, exhausting and mechanical evening of more or less dissipation. On the other hand, the evenings of great numbers of families are monotonous humdrum. They involve the assemblage of the same people, the same surroundings, the same paterfamilias yawning over his paper, and the same querulous mamma overladen with family cares. Fresh people with fresh thought, fresh atmosphere, anything to stir up and agitate the pool of domestic stagnation, are sadly needed and sadly scarce. There needs to be also a constant succession of such fresh people to bring about these results. The world is full of men and women, and in a better regulated life it would be the business, after the day's work was done, to entertain each other and give each other fresh life. As it is now, hundreds and thousands of our households are little better than cells for the incarceration of each family. Thousands are thus worn out prematurely from the utter lack of domestic recreation. There might be written over the graves of thousands: "Bored to death by the stagnation of domestic life."—*The Christian at Work.*

REGULARITY OF HABIT.—One of the most difficult of all minor habits to acquire is that of regularity. It ranks with that of order. The natural inclination of most persons is to defer work to be done until the last possible moment, or to put it off to another time, where this can possibly be done. Yet habits of regularity contribute largely to the ease and comfort and health of life. A person can multiply his efficiency by it. We know persons who have a multitude of duties, and who perform a vast deal of work daily, who set apart certain hours for given duties, and are there at the moment, and attend rigidly to what is in hand. This being done, other engagements are met, each in order, and a vast deal is accomplished, not by strained exertion, but by regularity. The mind can be so trained to this that at certain hours in the day it will turn to a particular line of duty, and at other hours to other and different labors. The very diversity is restful, when attended to in regular order. But let these run together, and the duties get mixed, and what before was easy is now annoying and oppressive, and the exact difference between many is at this point. There are those who confuse and rush, and attempt to do several things at once, and accomplish little, while others will quietly proceed from one duty to another, and easily accomplish a vast amount of work. The difference is not in the capacity of two men, but in the regular methods of the one, as compared with the irregular and confused habits of the other.

WOOLENS FOR SUMMER.—A physician who has for six months tested Dr. Jager's plan of wearing nothing but wool day and night, writes to the *Lancet*: "The result has been complete immunity from colds and a very marked increase in my capacity for work. I have not put on a great-coat night or day, have slept with an open window in my bedroom, and have been able to enjoy the luxury of an open cab instead of a close brougham. Instead of alternate feelings of heat and cold, there has been a uniform and most agreeable glow of warmth. I have, without any alteration of diet or regimen, lost seven pounds in weight, and (which will, I believe, tax the credulity of some) have witnessed the disappearance of a lipoma of the nape of the neck, which had existed for some years and had suggested the necessity for an operation. These latter facts powerfully illustrate the truth of Dr. Jager's contention that the complete and continuous action of the skin drains the organism of water and superfluous fat. I would say, further, that the feeling induced of perfect health is not the least of recommendations to adopt the system. I may mention that of the many who have, more or less, fully addicted themselves to it from my example or advice, I have not known one who has been disappointed. Lastly, I would add a word on the need there is, if the full benefit to be derived is wished for, that nothing but pure wool should enter either into dress or bedding."

USEFUL INFORMATION.

The Beer Industry.

There are ten breweries in the world which sell more than 250,000 barrels of beer each year. Five of these are located in the United States and five in Europe. The largest of the ten is the Anheuser-Busch at St. Louis, which sells 465,193 barrels a year. Two of the five American breweries are in Milwaukee, one in New York and one in Philadelphia. The St. Louis Brewery employs 2200 men and consumes annually 1,220,000 bushels of barley. The glass industry depends largely upon beer for prosperity. The St. Louis Brewery uses over 27,000,000 bottles a year. Yet this is only one of the five largest in the United States, and the number of smaller ones runs into the thousands. There are 27 in San Francisco, which does not take high rank as a consumer of beer.

Lager Beer as a Beverage.

When lager beer (which signifies a beer which takes time to perfect) was first introduced here, it was hailed as a panacea for the evils of strong drink. When properly made of pure barley, malt and hops, and kept for at least a year before tapping, it certainly is one of the best of fermented beverages, and so made and kept it is comparatively non-intoxicating and gently stimulating. With this idea our American public, who never do anything by halves, soon acquired a taste for it and to such an extent that it may now be called a national drink. So great has been, and is, the demand that brewers are using materials other than malted barley, such as corn and oats, etc., mixed with barley and hops, by which they accelerate its manufacture, making a sweetish, pleasing, heady beverage, but alcoholic; and the use of this kind of beer, in large daily quantities, with the idea that it is innocuous, has brought on a marked increase of renal complaints, so much so that many eminent physicians declare such beer more dangerous than the use of whisky, for the free use of such beer is found to produce a species of degeneration of all the organs, profound and deceptive fatty deposits, diminished circulation, conditions of congestion and perversion of functional activities, and local inflammations of both the liver and kidneys are continually present.

RELATIVE INCREASE OF POPULATION AND INDUSTRIES.—Assuming that the most reliable statistical estimates are reasonably correct, the population of the United States is 65,000,000. The increase since the last census is believed to be about 30 per cent. With this 30 per cent increase in population as the basis, it may readily be seen what industries are going ahead of the ratio of increase in population and what falling behind. Wool-growing, for example, falls behind. The increase in nine years has been but 17 per cent. The woolen manufacture, which has been represented as depressed, has increased 30 per cent. The consumption of cotton by home manufacturers has been 31 per cent. The wheat acreage has not increased in proportion to the increase in population. Iron production has gone ahead, the increase being about double the ratio of increase in population. Cattle have increased in numbers about 47 per cent in spite of the impression that there was a relative decrease. The railroad mileage has grown from 90,000 in 1880 to 150,000 in 1889. The increase is much in excess of the increase in population and is possibly in excess of the needs of the country.

MAKING ARRESTS.—Neither a private nor a public detective can arrest a criminal without a warrant and have the privilege to lock said criminal up in jail in any county in the State, where he is arrested, until the criminal is brought to where he is wanted. Every citizen, of course, has the right to arrest a person in the actual commission of a crime, but having been arrested the prisoner must have as speedy a hearing as the circumstances allow, and a complaint must be filed and sworn to to hold him or else the law steps in to give him his freedom. But private detectives have kept prisoners under detention without warrant issued by a magistrate, and in such a case the private detective has protected himself, as he thought, against prosecution for civil damages by having his prisoner sign a paper that his detention is voluntary. If the arrest is an honest one of a fugitive from justice, and not for speculative or other purposes, there is no need for secrecy in the matter of the incarceration.

IT has been said that all the money which the world possesses to-day would only purchase one-third of its railways, since the railroads in the world are worth nearly thirty billion dollars. In comparison with this sum the amount of money invested in banking throughout the entire world is but a trifle. The railroad business is one which is increasing at an almost incredible rate of speed. In 1875 the world's railways aggregated 185,000 miles, while in 1885 there were over 300,000 miles of railroad, thus showing an increase of 115,000 in ten years, or, on an average, upward of 11,000 miles a year. When it is considered that this would mean the laying each year of railway enough to reach nearly half around the earth, the magnitude of the increase can be in a measure appreciated.

THE RATE OF INTEREST is gradually decreasing in this country, as has been demonstrated by heavy financial transactions during the past few years. Only a few years since this Government was glad to pay six and seven per cent; now a Government bond bearing three and four per cent is eagerly sought for by investors. New York City has placed $7,500,000 of bonds on the market at 2½ per cent, and they were quickly taken; and in fact a small premium was paid for some of these, which is certainly remarkable, and shows that there is immense wealth seeking safe investments and that the credit of New York City is good. British consols bear 2⅞ per cent interest, and most people have laughed at the idea of offering securities bearing less than three per cent, but this achievement of New York will doubtless encourage other cities to attempt the same thing.

A TEST FOR TEA.—A Russian analyst gives the following as a test by which tea can be proved to be genuine or not: Take a pinch of tea in a glass, pour upon it a little cold water and shake it up well. Pure tea will only slightly color the water, while a strong infusion is quickly got from the adulterated or painted leaf. Now boil both sorts separately, and let them stand till cool, and the difference between them will be most marked. The false tea will become still stronger after a long standing, but will remain transparent, whereas pure tea will become muddy or milky. This last appearance arises from the tannic acid, which is a natural property in pure tea, but which in artificial tea is entirely absent.

AMERICAN PLATE GLASS.—The great advance made by American manufacturers of plate glass for glazing purposes has finally succeeded in completely shutting out from this country the foreign-made article. The last English branch importing house in New York has recently been closed out.

THE beet-sugar factory at Watsonville is now running day and night.

ELECTRICITY.

Electricity Has Come to Stay.

Steam is good so far as it goes, but the time will soon come when it will be unable to cope with the demands made upon it, and will leave the field like a disabled giant, to be replaced by electricity; and, indeed, there is no reason why it should not answer all purposes in a much more satisfactory manner than steam does.

We often hear people denouncing electricity, as attended with terrible risk to human life, but is it really more dangerous than steam, or indeed such simple necessaries of life as gas, kerosene oil, etc.? To urge this argument would be as absurd as to object—which many are fond of doing—to a life on the ocean wave, on account of the dangers attendant. It may be rather risky, but can we think of any vocation in life that is not fraught with melancholy possibilities? To my mind, there is much more probability of a boiler bursting and sending those around it with one stride into eternity than there is of a similar calamity happening by the mismanagement of electricity. A large per cent of the conflagrations occurring in factories and workshops are directly or indirectly due to the boiler-room fire. A system of producing power that will dispense with this danger must surely be a boon to the manufacturing world, to say nothing of the sanitary improvements arising from the discarding of a dirt-breeding steam boiler with all its other nuisances.

One of the most serious objections to electricity is its supposed greater cost than steam. Those who make that argument, as a general thing, suppose that each shop must generate its own current, but electricity as a motive-power is now mostly produced in large quantities and then distributed by means of wires to many shops, just as is the case with electric lighting.

Another of the advantages offered by the use of electricity is the possibility of bringing it perfectly under control and subdividing it in any quantities necessary. A small motor can be attached to every piece of machinery in a large factory room, enabling the operator to instantly disconnect the current, if he finds it necessary, without in the least interfering with any other machine in the room.

Having the advantages of a lesser cost, being much safer than steam and not so injurious to health as that power, electricity cannot but come into universal use.

ACTIVITY IN ELECTRICAL CIRCLES.—It is a question whether all the electrical-supply houses fully appreciate what a banner year 1889 is going to be for their business. Up to July 1st contracts had been closed for the installation of electric plants that will require a total amount of supplies far exceeding the aggregate of any previous six months, and the prospective plants for which bids have already been tendered, or will shortly be called for, and which will certainly be in operation before the new year, will make the total amount of material required and used run up into figures that will surprise every manufacturer and supply man. Already there is complaint in the East of the immediate scarcity of poles suitable for erection on residence streets. A large stock of insulators have been secured, but it is probable that contractors will experience some delay in securing shipments before the year ends. There has been a scarcity of certain sizes of copper wire every fall during the past four years, and this year will prove no exception. This great demand not only affects the manufacturers and dealers in line-construction material, but has also increased the activity among the makers of steam plants and all thereto pertaining, as the older lighting plants are rapidly extending their circuits, and requiring in certain cases several hundred horse-power extra per plant; the smaller towns of 1500 or 2000 inhabitants are demanding electric lights; in the larger cities extensive electric motive-power plants are being constructed, and in many cities of all sizes the street-railway companies are rapidly adopting an electric-motor system.

ELECTRICIANS are still finding new fields of employment for the subtile fluid. The latest is a new method of communication. By it a man can sit at his desk in New York and the letter he writes with the electric pen is instantaneously reproduced in Boston, St. Louis, Chicago, or any point with which he wishes to communicate.

THE LARGEST DYNAMO which is now in existence is in this country, but Great Britain counts on having a larger one. It is being made for the new electric-light works at Deptford. The shaft of the machine will be turned out of a block of steel weighing 75 tons, which has just been cast in Glasgow.

LETTERING IVORY.—A process of lettering bone or ivory by sinking the letters into the material in a permanent fashion has recently been introduced. These ivory plates are taking the place of engraved metal plates for signs, checks, badges, and so on. Electrical engineers have also adopted the new plates, which can likewise be applied to organs and pianofortes.

LONG-DISTANCE TELEPHONING.—Telephonic connection between Chicago and Milwaukee, a distance of 90 miles, is in successful operation.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Vulcan Iron Works' New 60-Inch Gang Edger; West Vulcan Mine, With System of Rock-Filling, 241. Large Iceberg in Alaskan Waters; The Muir Glacier from the Moraine, 349.

EDITORIALS.—An Improved 60-Inch Gang Edger. 241. Passing Events; The Position of Copper; An Extraordinary Power Equipment; Big Bend Tunnel Failure; Foundry Notes; Rock-Filling in Mines, 242. The Broken Hill Silver District; The Muir Glacier; Fines on Gold, 249.

CORRESPONDENCE.—San Francisco to Alaska, 242. Tuolumne County Mines; Marshall's Monument, 243.

MISCELLANEOUS.—The Folly of Abandoning Mines; Union Square, San Francisco, 243.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 244-5.

MECHANICAL PROGRESS.—Positive and Relative Movements in Machinery; The Blacksmith in Danger; Multiple Steam Engines; Manufacture of Large Shafts; Development of the English Steel-Casting Trade, 246.

SCIENTIFIC PROGRESS.—The Shadow of Electricity; The Microbe of the Magnet; Searching for a Soul; Power of Mind Over Matter; Curious Note About Oil Paintings. 246.

GOOD HEALTH.—The Health of the State; Want of Sleep; Regularity of Habit; Woolens for Summer, 247.

USEFUL INFORMATION—The Beer Industry; Relative Increase of Population and Industries; Making Arrests; A Test for Tea; American Plate Glass, 247.

ELECTRICITY.—Electricity Has Come to Stay; Activity in Electrical Circles, 247.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 254.

Passing Events.

The Golden Gate river-bed mine, above Oroville, recently described in the PRESS, was this week pumped out and mining has commenced. The big flume carries all the water of the river, leaving the bed bare. They may be able to work the whole bed out this season.

The lead miners are not having it all their own way about those free Mexican lead ores. The Board of Trade of Kansas City, as well as the miners of Deming, N. M., have adopted resolutions asking that the ruling which admits these ores be continued; they say that the import duty on lead ores would cripple smelting enterprises. It was doubtless the smelting industry that was instrumental in obtaining the ruling so objectionable to lead miners.

The failure of the Big Bend Tunnel enterprise, with a loss of $2,000,000, is rather a bad setback to river-bed mining on any large scale. It cost so much to remove boulders that no money could be made. Still, at almost any place, rich spots might be struck in the river-bed, and because such enterprises fail in one place it is no reason they will in another.

Monterey county is just now excited over its "lost mine," which is said to have been found at last. A legend about this "lost mine" is one which has long prevailed, not only at Monterey but in many other parts of the country.

THERE is talk of an electric street railroad at Ukiah, Mendocino county, the dynamos to be run by water-power.

The Position of Copper.

European mail advices just to hand give the statistical position of copper less satisfactory, and this, too, in the face of the increased consumption and deliveries in last month. Although the stocks were reduced, yet they were not to the same extent that marked it the two preceding months. Probably the advance in the price of copper tended to augment the supplies, but as the price has since gone off, it is not at all unlikely but they will again decline. According to James Lewis & Sons' ore and metal report, the average prices of bars were as follows in the following months: August, 1884, £53 15s.; August, 1885, £42 10s.; August, 1886, £39 5s.; August, 1887, £40 3s. 9d.; August, 1888, £89; June, 1889, £41 5s.; July, 1889, £42; August, £43 5s.

From the highest point reached in last month the English market fell below £42, which clearly shows that dealers had less faith in the situation, and it must be admitted that the statistical position justifies their fears. The following compilation in tons gives the situation in a compact form:

1889.	Stocks.	Supplies.	Deliveries.
February	118,140	10,009	1,397
March	124,876	11,135	4,399
April	124,447	8,080	8,509
May	117,420	6,837	13,864
June	111,689	4,758	10,489
July	108,116	9,716	13,289
August	105,985	11,792	13,923

It will be seen by the above that while the consumption increased from 10,489 tons in June to 13,923 tons in August, the supplies increased from 4758 tons in June to 11,792 tons in August. According to James Lewis & Sons' circular, in the increased supplies, all countries except Australia are represented. With such a showing it is but natural for consumers not to anticipate their wants to any great extent, well knowing that unless the output is curtailed, holders of large blocks in Europe will grow suspicious and force sales even at a lower range of prices. In commenting on the present situation, James Lewis & Sons of London under date of Sept. 1st say:

Negotiations for the settlement of the claims and lawsuits of the mining companies against the Comptoir d'Escompte have continued. The obstacle appears to be the return which the liquidator of the Comptoir d'Escompte is to make to the mining companies for the abandonment of their claims—if a money payment, how the money is to be raised. An offer has been made by him to guarantee the gradual realization of the present stock, handing over to the mining companies one-third of the amount realized over and above that for which the copper is pledged (which is not stated), the companies, on their part, undertaking not to increase their production. It appears that the claims of three companies for copper delivered and not paid for amounts to 4,000,000 francs, or £160,000.

PURCHASING SILVER FOR COINAGE.—Secretary Windom has discontinued the custom of making counter-offers by the Treasury in the purchase of silver for use in the mints. This custom was introduced by Treasurer Jordan, who was unfriendly to the silver interest, for the purpose of keeping the market price as low as possible. The law provides for the purchase of a certain amount of silver during the year at prices not exceeding the market price at the time of purchase. The Director of the Mint receives every day a cable from London giving the market price for silver there, and from that is figured out the parity. For instance, the parity by the last report is 93.60, and no price above that can be paid unless there is an increase in the market value. Offers of silver are received twice a week by the Mint, any of which may be accepted if the price asked is not more than the parity. Jordan, in order to get silver at the lowest possible price, inaugurated the custom of making a counter-offer lower than the price asked. It is now held it is not proper for the Treasury to go at it systematically to "bear" the silver market.

THE PATENT OFFICE.—The annual report of the Commissioner of Patents shows the number of patents applied for the past year was 36,740, and issued 21,518, being a slight decrease in the number issued compared with the preceding year. The receipts of the office were $1,186,557. An increase in the salary of the principal examiners is asked for.

THERE is trouble at the carbonate camp of San Pedro, N. M., over an order of the superintendent of the big copper mine to the foreman, instructing him to employ only Italian miners, virtually discharging the others.

An Extraordinary Power Equipment.

The Pelton Water Wheel Company of San Francisco has recently furnished the Treadwell mill of Alaska a power equipment presenting many very interesting features.

The mill referred to is the largest quartz-mill in the world, consisting of 240 stamps, 96 concentrators, 12 ore crushers, etc., requiring about 500-horse power. All of this machinery, covering several acres of ground, with its vast complication of counter-shafts and connections, is now run by a single Pelton wheel, 7 feet in diameter, operating under a head of 490 feet, making 235 revolutions, and using 630 cubic feet of water per minute, which is discharged through a nozzle 3.31 inches in diameter. With a 4-inch nozzle this wheel will work up to 735-horse power.

Perfect regulation is afforded by the use of a deflecting nozzle, operated by a hydraulic governor. This is a nozzle about 4 feet long, with a ball joint at the butt end. To the discharge end is attached, by lever connections, an automatic hydraulic regulator, which varies the amount of water applied to the wheel as may be needed to adapt it to varying loads. This device has been generally adopted by the Pelton Company, as affording the most simple, sensitive and satisfactory regulation, both for general machinery and electric-light purposes.

Comparisons are often made at the East between the advantages of steam and water power. As applied on the Pacific Coast, water has so much the better of steam that the latter is not to be thought of where water is available. A striking instance of this advantage is here afforded. The wheel above referred to weighs but 800 pounds, and the entire equipment, embracing shafts, boxes, driving pulley, etc., only about 4000 pounds. A steam machinery plant, to give the maximum capacity of this wheel, would not weigh less than 200 tons. The expense of operating such a plant would run well into the thousands every month, while the cost of running the Pelton wheel is merely the oil needed for the journal bearings.

Included in the above equipment was also an 8-foot Pelton wheel, to drive a 15-drill compressor, requiring 175-horse power. Also two small 18-inch wheels to run dynamos, which light the entire works. Probably no such amount of power was ever before furnished at so small expense, both as to first cost and that of maintenance. This mammoth mill affords a fair illustration of the modern methods of mining, and of how low-grade ores can be made to pay large dividends.

The Big Bend Failure.

One of the largest river-bed mining operations even undertaken in this State was that of the Big Bend Tunnel Co., Butte county. A few years since we gave a detailed description of the undertaking, with illustrations. The work involved the cutting of a large tunnel, 12,000 feet in length, through which the river was to be turned, leaving the natural bed dry so it could be worked for the gold. The scheme looked feasible enough, as large amounts had been taken from other portions of the river-bed near by in early days, when unusual low water permitted work.

The result has not been satisfactory, however, and a loss of some $2,000,000 has been entailed, mainly falling on Dr. R. V. Pierce of Buffalo, N. Y., the principal stockholder. The tunnel constructed to divert the river was a success, but when the river-bed dried it was found that the work, so far as prospecting at the gold deposits was concerned, was [illegible]egun. The bed of the river was covered with innumerable bowlders, and it was a losing task to secure the gold. One gang of men would strike a rich find, but another would work away at bowlders and eat up the profits of the finds. It is hardly probable that anything further will be done in the way of mining, and the only revenue that will be got out of the property will come from the sale of a tract of land, some of which is valuable, including hundreds of acres of good timber.

In the official bulletin announcing the failure of the scheme, Dr. Pierce says: "But after all our efforts, and much as we regret to acknowledge the fact, yet we are quite prepared to admit that at present we see no prospect of realizing our former expectations with respect to these mines."

Foundry Notes.

Business is rather dull among the foundries just now, as is usually the case at this time of the year.

On Saturday night a fire broke out in the pattern shop of Weed & Kingwell's foundry, entailing a loss of about $2000.

The Oakland Iron Works suffered a loss of about $10,000 by fire on Sunday morning. The principal loss was on machines, tools and designs. There are 20 men employed at these works.

The Union Iron Works have sent the cruiser Charleston to Mare Island navy-yard for acceptance by the Government authorities. She was towed up on Tuesday of this week. Work on the San Francisco is well along, and the vessel will probably be ready for launching by the end of next month. There will still remain considerable to do on her, however, after she is afloat.

Frank A. Huntington has established himself in much roomier and more convenient quarters at No. 213 First street. The new shop is well lighted and arranged for facilitating work. The machine shop fronts on the street, and in the rear is a good-sized foundry, fully equipped. To one side of that is the pattern shop and draughting-room. There is also a large sales-room fronting on First street, partitioned off from which are the bookkeeper's room, office, and a special room for consultation with visitors. Since Mr. Huntington's business increased in the manufacturing of Huntington quartz-mills and other specialties, it became necessary to have enlarged quarters; so the old place on Fremont street, where he has been many years, was given up. At the new shop he has put in all the necessary tools and appliances to do all of his own manufacturing. The sale of Huntington mills is constantly increasing, and they are now being sent to mining regions all over the world.

Rock Filling in Mines.

In the Menominee range mines, Michigan, they have had four distinct periods in mine work, beginning with open-pit works, followed by irregular timbering, then the Nevada system of framed timber, and ending with the present plan of rock filling. Where the hanging-wall is of soft clay slates, as in the West Vulcan, softening rapidly on exposure to the air the timbering was not satisfactory; so the modern method of rock filling has been adopted.

The drawings of the West Vulcan mine exhibit the general posture and westward pitch of the ore deposit. At the eighth level the ore is 600 feet long and the average thickness about 25 feet.

The longitudinal section exhibits the "levels," with the method of working the stopes and removing the pillars. This mine is operated by a shaft and a skipway or slope, as shown on the cross-sections. The large new shaft is 665 feet deep to the ninth level. The western pitch of the ore is clearly shown on this section.

The cross-sections looking west show the dip of the ore body down to the ninth level, now the working level. Cross-section *B* shows the main shaft in the hanging-wall.

The timbering, mainly after the Nevada system, has been carried to the eighth level. Rock filling is now being used in the ninth level, from which 130,000 tons of ore were mined last year. The system of rock filling, as described in a paper by Mr. Jno. Fulton before the American Institute of Mining Engineers, will be more fully given in next week's PRESS.

CENSUS AND MINES.—The superintendent of the Census has appointed Richard P. Rothwell of New York chief special agent for the collection of gold and silver statistics for the eleventh census. Mr. Albert Williams, Jr., formerly of this city, will be one of his assistants in the field. The superintendent of the Census also appointed Mr. Baird Halberstadt of Pittsburg, Pa., as special agent to assist in the collection of coal statistics.

THE "lost mine" in Monterey county, at the head of the Carmel river, is again reported as found, and a number of miners are on the ground. This famous mine has been "found" many times in the past 20 years. This time it is an old deserted tunnel which [illegible] given rise to the story.

The Broken Hill Silver District.

The great success that the Broken Hill Proprietary Co.'s silver mine has proved, and the enormous dividends it is now paying, attract much attention in this country. In fact, there is no other silver district being so actively and successfully developed as this one of the Barrier Ranges in New South Wales. One can reach it now by rail from Sydney via Melbourne and Adelaide, a distance of 1418 miles. All the mines and works are in the limits of the town of Broken Hill, which has a population of 13,000. Broken Hill, with its buildings, furnaces and business like air, leaves an impression as a place more like a city than a mining camp, although it is situated in an arid waste and droughts last for years at a time. For a few successive years past they have had sufficient rains to fill the reservoirs, which were constructed as storage for winter rainwater. This water is filtered and used for drinking purposes. We are informed that a local water company, called the Nolans Stephens Creek Water Supply Co., is laying pipes and expects soon to furnish an abundance of water for all purposes.

Eighteen months ago great excitement and lively speculation extended all over Australasia, the central point of the speculation being directed to the Broken Hill Proprietary Co.'s mine. It was the Central Broken Hill Silver Mining Co.'s mine, adjoining the Proprietary on the south, that set this great silver boom in motion by very rich silver ore that was then discovered. In the June 9th issue of last year cautionary remarks were addressed to our neighbors of Australia warning them by our own sad experience against the probable effects of the speculation in the mines and shares then raging in that country. The collapse of the boom, as stated in a subsequent issue of July 21st, was more disastrous and sudden than anything that had ever occupied the mining world. The nominal value of mining shares in this mining district alone depreciated to the extent of $40,000,000. One instance of the many wild cats floated during this great boom may be mentioned the Beltana Broken Hill mine. This property, although not in the Barrier district, was subscribed for right in Broken Hill. Beginning at £1 paid, they advanced by great strides, and within three months from the time the property was floated, sales had been effected for sums as high as £3000.

Of course those that realized by these prices made magnificent profits, but those holding their shares found themselves possessed with just so much valueless paper. The "wonder," the most remarkable silver mine now known, the Broken Hill Proprietary, continued to pay its regular monthly dividends of 30s. per share under the able management of Mr. W. H. Patton, formerly of the Comstock, Nevada. During the boom, the shares of this mine sold for £290 each, giving a return on the investment, even at this figure, equal to 6¼ per cent per annum.

In addition to our remarks in the last issue it may be stated that since this mine started active operations four years ago, it has produced £2,165,274 worth of silver and lead, and more than half was turned out during the last 12 months. As this indicates, the annual increase in the production has been marvelous.

In 1885–6 the value of the ore raised was £44,500; in 1886–7 it took a great jump to £361,700; in 1887–8 the value was £660,700; and in 1888–9 the million was exceeded, the figures being £1,098,000. This rate cannot, of course, be increased, yet by information received from that district we learn that the annual increase will be for many years to come. The mine has now nine furnaces in full blast, and, owing to increased developments of ore, it is found expedient to erect a tenth furnace with 80 tons capacity. The great fissure lode rises into hills and ironstone ridges, as it does 20 miles away from the hum and roar of the furnaces at Broken Hill. The ore is of a free-smelting nature, containing sufficient carbonate of lead, iron and manganese to admit of easy treatment and little trouble in fluxing. The bulk of the ore is forwarded to furnaces, but there are bands and seams of silicious matter which requires treatment by concentration.

One peculiar feature in this great lode was the discovery of rich kaolin ore, in which silver was previously seldom known to exist. Again, in this district silver is found in the form of chloro-bromide and iodide *below* the water-line. This fact has tended to upset the theory of mining experts and scientists that chloride of silver did not exist below water-mark. Again, sulphides are found *above* the water-line. In the Proprietary mine, the "Big Mine," as it is commonly called, they have one ore body 160 feet in width of payable ore, and now comes from good authority by last Australian steamer, that in one place in their mine is a width of 220 feet, with no sign of the east wall, the ore averaging over 70 ounces silver and 40 per cent lead. There is reported over a mile of continuous ore. One mine below the Proprietary has 1300 feet continuous pay ore from 10 to 100 feet wide, and reported 25 per cent lead and 20 ounces silver. It may be stated that in that district 30 ounces ore will return a profit of £1 per ton for shipment, and that 36 ounces ore means a net return of 30s.

Following are the mineral exports from Broken Hill for the week ended July 15th:

	Tons.	Cwt.	Qr.	Lb.	Value.
B H Proprietary, 16,950 bars, argentiferous lead	845	10	2	16	£29,112
Block 14, 4050 bars argentiferous lead	154	0	0	0	4,050
Block 14, lead ore	54	0	0	0	324
South, 11 trucks silver lead ore	65	7	1	0	327
North, 30 trucks silver-lead ore	179	9	0	0	898
Junction, 33 trucks silver-lead ore	185	15	1	0	1,860
Total value for the week					£33,271

The Muir Glacier.

On this page are given photo-facsimiles of the Muir glacier and an iceberg, Alaska, and on page 242 is a description of the scenic wonders of the Alaskan coast. The trip to our northern waters is one now frequently made by tourists, the travelling accommodations being very convenient and inexpensive. One may go from here by rail to the waters of Puget sound, and from there by steamship to Alaska. Most of the voyage is by the inland passage through the straits, sounds and channels, so there are none of the inconveniences of an ocean voyage. For only a very short distance does the steamer pass through the open sea. The round trip is all made within a month. From a perusal of our correspondent's letter, published in the issues of this and last week, an idea will be gained of what is to be seen on a trip to Alaska.

LARGE ICEBERG IN ALASKAN WATERS.

THE MUIR GLACIER FROM THE MORAINE.

Films on Gold.

Anything which creates films and prevents perfect contact between the metals, renders the gold non-amalgamable. The formation of films and other causes which prevent amalgamation, may be accounted for by the presence in the battery of certain soapy varieties of powdered hydrated silicates of magnesia, or alumina, grease, urine, decomposing animal or vegetable matter contained in impure water, or water impregnable with sulphureted hydrogen, or containing certain soluble metallic salts. Water obtained from mine-pumpings, or that which flows over tailings pits to deposit slimes and is then used again, is not always good to use in a gold-mill. It often becomes charged with sulphuric acid and acid sulphates. When this acidulated water is used in a battery many complicated reactions may take place.

Mr. Wm. Skey, analyst to the Geological Survey of New Zealand, when writing on the reported loss of gold in the Thames field, gives the following as the result of his researches:

That numerous samples of bright, clean gold of all degrees of fineness refuse to amalgamate on any part of their natural surfaces, though taken direct from the ledge and untouched by hand.

That on such surfaces sulphur is always present.

That native gold in a pure state readily absorbs sulphur from moist, sulphuretted hydrogen or sulphide of ammonium.

That surfaces so affected refuse to amalgamate, though no apparent change can be observed in their aspect.

The action of sulphuretted hydrogen on gold in rendering it non-amalgamable when placed in contact with mercury was demonstrated with striking effect. From these results the author has been led to suppose that a large area of the natural surfaces of native gold is covered with a thin film of an auriferous sulphide, and that the greater part of the gold which escapes amalgamation at the battery is represented by that portion of this sulphurized gold which has remained unabraded during the process of milling or extraction from the ledge; the state of the gold rather than the mercury, therefore, being the greatest impediment to thorough amalgamation.

That this absorption is altogether of a chemical nature.

The Eiffel Tower is as notable a financial as an engineering success. The shareholders have already received back three-fifths of their capital invested, and it is not unlikely that the entire amount will be repaid before the exhibition closes, leaving the remainder of the 20 years for which the concession runs to earn interest on money which can be profitably employed elsewhere.

NOT DEAD.—Eastern papers appear to be cultivating the notion, says the Homer *Index*, that Nevada is not only dying, but is actually dead. Don't be afraid. The "battle-born" State is yet in its bib and tucker. Let Congress say that silver shall have a fair commercial value, and Nevada will at once jump to the highest plane of prosperity. She will then be intersected by railroads, and places that are now arid wastes will be alive with thriving settlements. Many a dead old mining camp will come to life again when its product becomes worth something more than pot metal.

PREPARATION FOR REBRONZING GAS FIXTURES.—A convenient preparation for rebronzing gas fixtures is made by mixing bronze powder with any transparent varnish—say amber, gum, damar or copal. Do not mix more than you are going to use at once, because most bronze powders act as powerful driers, and what you have left of the mixture soon becomes hard and use less. It is best to put a little of the varnish in a small, flat saucer, and some of the loose powder next to it, and mix with the brush while you are using it, as a painter mixes colors on his palette.

NEW JERSEY GOLD.—The village of Irvington, three miles from Newark, N. J., has a gold discovery boom. James Murray, a laborer, while excavating on a road found a ledge of rock containing gold. Judging by samples, the rock is said to be worth $60 a ton.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company—Location of principal place of business, San Francisco, Cal. Location of works, Placer County, Cal.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment (No. 14) levied on the 13th day of August, 1889, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 13th day of August, 1889, so many shares of each parcel of such Stock as may be necessary, will be sold at public auction, at the office of the Company, 303 California Street, room 11, San Francisco, California, on TUESDAY, THE EIGHTH DAY OF OCTOBER, 1889, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, 303 California Street, room 11, San Francisco, California.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

Ships under advances to smelting works in Boston, New York, Baltimore and Liverpool.

Twenty-one years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters.

All business conducted on Cash Basis.

Purchase and shipment of Mining Supplies A SPECIALTY.

Sales of Developed Copper Mines undertaken.

Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

FOR SALE.

One 10x18 inch Clayton Belt Air Compressor.

One 3-inch Sergeant Drill.

One 5-ft. Double Screw Drifting Column with Arms.

One 4-ft. Single Screw Stoping Bar.

One 8½x13 ft. Air Receiver.

One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the

PAYMASTER MINING CO.,
Yuma, Arizona Territory.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

C. S. HALEY, Secretary.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING SEPT. 17, 1889.

411,183.—DREDGING APPARATUS—A. B. Bowers, S. F.

411,223.—BOILER—I. Hulme, Yaquina, Ogn.

411,199.—VEHICLE—F. A. Huntington, S. F.

411,198.—TELEGRAPH KEY—A. E. Johnson, Carson, Nev.

411,164.—NOSE-PAD FOR EYE-GLASSES—J. P. Molitor, Vallejo, Cal.

411,173.—PENCIL-SHARPENER AND PAPER WEIGHT—A. Thurber, S. F.

The following brief list by telegraph, for Sept. 25th, will appear more complete on receipt of mail advices:

California—Henry M. Wrede, San Francisco, cable-gripper; Benjamin Walton, Cramton, fowl or stock-feeder; Alpheus E. Rowe, assignor to H. L. Tatum and J. J. Bowen, San Francisco, crushing-mill; John Richards, San Francisco, pumping machine; David H. Lunn, Ferndale, wire-stretcher; Reuben W. Hent, San Francisco, roller-bearing; Alexander Grant, assignor of half to M. N. Miller, Los Angeles, steam boiler; George B. Fraley, San Francisco, electric railway; John Ducker, Santa Rosa, book-rest and easel; Jabez Draper, Stockton, punch; Charles D. Bobo, Nevada City, obstetrical instrument.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TELEGRAPH KEY.—Alfred E. Johnson, Carson City, Nev., assignor of one-half to Moses M. Cohn. No. 411,198. Dated Sept. 17, 1889. This invention consists of a pivotally mounted swinging key-lever, a movable contact-finger connected with said key-lever, a series of contacts formed to represent telegraphic characters, over which the contact-finger is moved by the key-lever, and certain details of construction and arrangement. The object is to provide a telegraph key for the use of beginners to give them familiarity with the form and sound of the telegraphic characters, and also for the use of any person who is unable to send messages with the ordinary keys.

COMBINED PENCIL SHARPENER AND PAPER WEIGHT.—Alfred Thurber, S. F. No. 411,173. Dated Sept. 17, 1889. This device consists of an exterior case of any suitable size and shape, open at the top and having slotted sides, and in connection therewith of a block fitted to close therein, and having a knob by which it may be handled for the purpose of a paper weight, and trunions sliding in the slotted sides of the case, so that it may be turned and reversed within the case to expose the pencil-sharpening mechanism, which consists of a knife and file fixed to a lever fulcrumed at one side of the block, so that the knife and file may be moved over a slot through which the point of the pencil projects and sharpen the pencil with a drawing cut. An even and symmetrical point is made to the pencil.

VEHICLE.—Frank A. Huntington, S. F. No. 411,196. Dated Sept. 17, 1889. This improvement consists of an engine and suitable intermediate gearing whereby the vehicle may be propelled. The invention is designed to apply a gasoline or other vapor engine to an ordinary carriage or road vehicle, with frictional mechanism for transmitting power, changing the speed of the forward movement of the vehicle and reversing the motion of the wheel at will. When the vehicle is in motion a blast of air is forced around the cylinder, which keeps the cylinder sufficiently cool for practical work.

ELEVATORS COMMON CARRIERS.—An important decision has been made by the Supreme Court in the case of Treadwell against Whittier, Fuller & Co. By a jury in the Superior Court Treadwell was awarded $9000 damages for injuries sustained by the fall of defendant's elevator on which he was riding. At the time of the accident, Dec. 12, 1878, Treadwell was in the employ of the firm. In deciding the case, the opinion of the Court, which was written by Justice Thornton, says: "The defendants used their elevator in lifting persons vertically to the hight of 40 feet. That they were carriers of passengers and should be treated as such we have no doubt. The same responsibilities as to care and diligence rested on them as on carriers of passengers by stage-coach or railway." Continuing on the same subject the decision says: "Nor are the defendants excused by the fact that the elevator in use was constructed by a competent and skilled manufacturer from whom they purchased it. The manufacturer was their agent or servant in the construction of the elevator, and they are responsible for any want of care of the maker or builder."

THE Caledonia Gold Mining Company of Dakota will pay, September 26th, dividend No. 15 of eight cents a share, aggregating $8000, making $72,000 paid this year.

Mining Personals.

D. P. Pierce is superintendent of the Hathaway mine, Ophir, Placer county.

W. M. Lent, largely interested in the Bodie mines, is registered at the Palace hotel.

Robert R Grayson, secretary of the Bullion and Grand Prize companies, has returned from Idaho.

Thos. H. Dougherty is the superintendent of the Golden Messenger M. Co., Meagher Co., M. T.

F. F. Coffen, superintendent of the Nevada Queen and other Tuscarora mines, has returned to Tuscarora.

John Kelly, superintendent of several of the Bodie mines, left last week for a few weeks' visit to the East.

H. W. Sparks is superintendent of the Red Lion Mine, Cable district, M. T. The mill has been enlarged to ten stamps and is working satisfactorily.

F. S. Sutherland is superintendent of the mines of the International Company of Mexico, now operating in the mines of Alamo, Lower California, the scene of the recent gold excitement.

A Breece and family have located in San Francisco. The Breece & Wheeler mine, Placer county, is left in charge of W. Grinnell, as both of the owners are now residing in San Francisco.

Captain B. F. Dahl of San Francisco, who holds a controlling interest in the North Gould and Curry and East Best and Belcher, is visiting the Comstock. Work was resumed in both mines some time ago.

James A. Zabriskee, a mining engineer, interested in Mexican mining affairs, is in the city. He speaks very hopefully of the outlook for American investments in Mexico, both in railroad and mining matters.

Mr. Pearson, superintendent of the Gopher-Boulder mine at Kelsey, El Dorado county, has returned from Europe, and it is stated that the electric plant for the working of these mines will at once be put in.

Superintendent R. K. Colcord of the Esmeralda Con. Mining Co., is losing no time in getting to work on the mines of that company at Aurora, Nev. After the machinery is put on the Humboldt, Mr. Colcord will increase the working force to about 50 men.

Francis N. Byrne, who went East some months ago in the interest of the Gold Bank Tunnel Company, which was an enterprise to run a tunnel from the South Yuba river to the Nevada and Grass Valley districts, for the purpose of developing quartz veins, has returned to Nevada City.

Dr. H. H. Hutchings, who represents an Eastern company, is engaged in developing antimony mines near Black Knob, below Sacramento canyon, in the Humboldt range, Nev. He has seven or eight men employed, and expects to increase the force shortly to 17 men. He has two or three hundred tons of ore on the dump. He intends to reduce the ore on the ground, and for that purpose is erecting a smelting furnace, by which the pure metal will be turned out by one operation.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

GOLD has been discovered near the city of Tacoma, W. T., and a number of claims have been located.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or who does not intend to pay for it*, let him not fail to write us *direct* to stop it. A postal card costing one cent only will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party neglected to stop it, we shall positively demand payment for the time it is sent.

For special reasons we here give prominence to the above notice. It has appeared in the above form in nearly all, if not every, issue of our journal for over one year past. Yet we are *occasionally* finding subscribers who say they have never seen the notice. Although they have received our paper constantly, or are knowing to its being mailed regularly to their address, they refuse to pay for it. Their excuses are various, viz.: "Never subscribed for it;" "subscribed only for the year paid for;" "told some agent to stop it;" "told the postmaster to stop it," etc. Through 24 years of careful and successful business, the proprietors of this journal have *never, knowingly or willfully, sent a newspaper to any person they knew at the time did not wish it, and we never will*, unless such person *unwarrantably* refuses to pay arrearages when able to do so.

No doubt we have been too obliging in retaining names once entered on our list of those whom we supposed desired to continue after the date paid for had passed. This, however, is owing to several reasons. Our paper is devoted to a cause that should entitle it, as long as devoted and true, to the friendship, goodwill and protection, if not the substantial support, of the individuals and classes whose welfare it sincerely strives to promote. The relations are such as should inspire mutual confidence and trust between publishers and subscribers.

While some are displeased to have a single copy of this paper sent beyond the time paid for, others are more lastingly offended at what they consider a breach of confidence, if the paper is stopped without their special order.

We shall be more careful than ever of sending this paper on credit in the future. Shall endeavor to employ none but *honest* and *careful* agents. Yet, if mistakes or discrepancies do occur, of any kind, we ask the favor of every subscriber to notify us promptly by LETTER (carefully stamped) or POSTAL CARD, with the full assurance herewith that we will not, knowingly, send the paper to any one who does not want it.

Those who report having written the publishers to stop their paper, before becoming angry about its not stopping, should remember it is far more likely that their letter never reached the publishers than that they would attempt to do business on so unsafe a plan as to continue to trust a subscriber whom they knew had written to stop it. In this connection we repeat the following points about stopping papers, some of which we know have been missed by very good and well-meaning and tolerably careful subscribers.

About Stopping this Paper.

In sending word to the publishers, you should be particular to note all of the following points: 1st, to send it to the P. O. by a trusty hand; 2d, to be sure you have a stamp on it; 3d, that it is correctly addressed; 4th, that your name is plainly written; 5th, that you give the name of your P. O.; 6th, that you give the name of the paper (or we should have to look over the long lists of subscribers on several newspapers). If your letter reaches us with the above 5th and 6th points overlooked, we should have to look over thousands of addresses to find your name to discontinue your paper. By missing one or more of the points above numerated on the part of subscribers, we are doubtless not blamed for not stopping papers when it is impossible for us to do so—and in many cases receive no intimation even about the matter.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

GOLD MINE WANTED.

Owners of a good, well-developed, free-milling gold mine, that can be run with water-power, who are willing to give an interest for the erection of a new stamp mill and machinery, can address, A. B. C., 326 S. Fort St., Los Angeles, Cal. Give full particulars. Owners only treated with.

AMERICAN MINING AND STOCK CODE

"KELLOGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded postpaid on receipt of price by

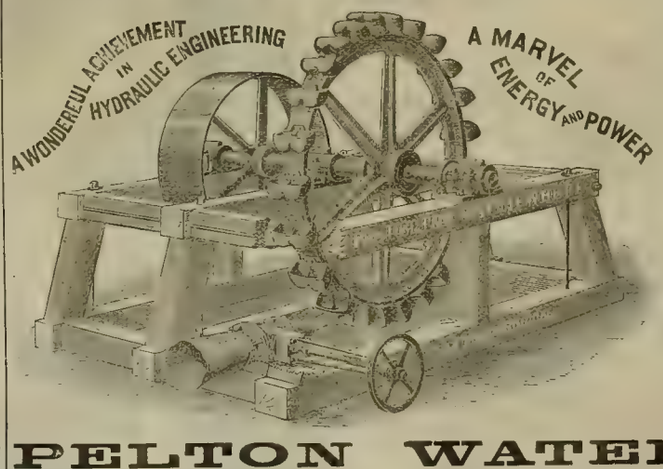
DEWEY & CO.,

220 MARKET STREET, SAN FRANCISCO.

ATTENTION, MILLWRIGHTS:

A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.



A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill-owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, post-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

Over 800 in Use in all Parts of the World.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

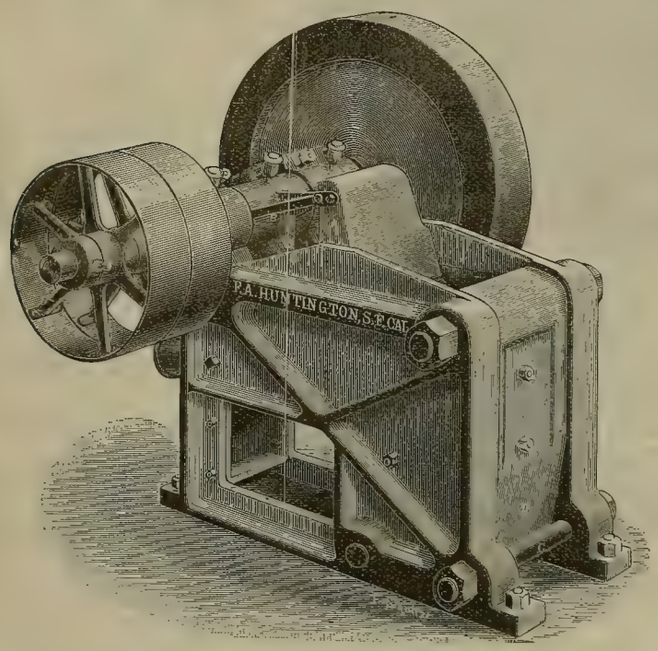
APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

120 FIRST ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

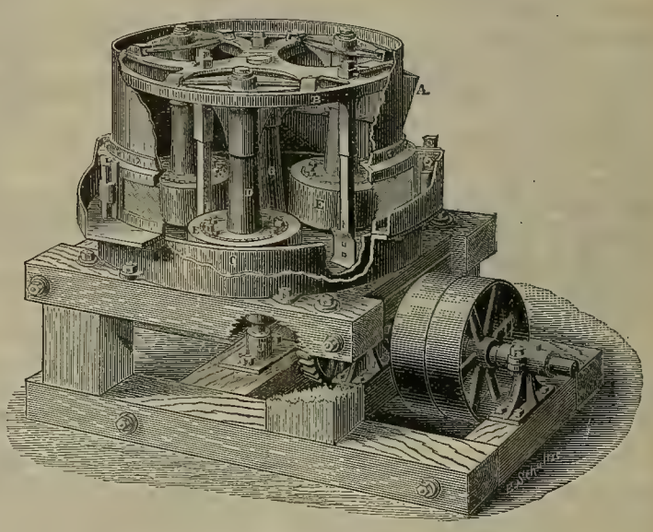


Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



PRINCIPAL OFFICE, 213 FIRST STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 26, 1889.

General trade the past week was only fair. Prices in nearly all lines of goods are stronger. In the local market money is reported to be working closer, yet all legitimate wants are readily met at bank. Remittances from the interior are coming in more freely, which, with an advancing market for wheat, is causing more confidence in the future.

MEXICAN DOLLARS—The market continues fairly steady at 74¼@74½c. The demand is only moderate. The steamer hence Sept. 21st for China took out for Hongkong $60,147; Shanghai, $70,000. Total, $130,147.

SILVER—The steamer hence Sept. 21st for China took out for Japan $100,000; Hiogo, $52,000. Total bullion, $152,000. For shipments by the above steamer 93½c was paid. Our quotations are for Selby's Gold and Silver Refinery bars, and if other refined silver does not fetch the quotations there must be some fault in the refining. The market since the steamer left has been quiet but gaining in strength, with 93¾c freely bid to-day, with no sellers at the price. London cables and New York telegrams give a strong market. The statement by the Treasury that only $8,000,000 in silver dollars remains in the Treasury, against which silver certificates have not been issued, has a decided strong bull bearing on the metal, for it goes to show that we can care for about all the silver mined. The address of a leading banker at the Bankers' Convention favoring the retiring of legal tender notes and issuing silver certificates, and also free coinage of silver, is also in favor of the metal, for it goes to show that the sentiment in this country is growing in favor of bimetallism. The output of silver bullion on this coast is still light.

QUICKSILVER—Receipts the past week aggregate 382 flasks, and exports 10 flasks to Auckland. The market is quiet but firm.

LIME—Receipts the past week aggregate 6110 barrels, being the heaviest for any single week this year. The consumptive demand is still heavy. Prices are unchanged.

BORAX—Receipts the past week, 221 ctls., and exports 21,589 lbs. to Boston and 42,756 lbs. to New York, both via Victorta, B. C. The market is steady, with an active Eastern demand.

LUMBER—Prices have advanced the past week $1. The advance is due to a better combination of millmen.

TIN—Exports by sea the past week were 32,240 plate to Victoria, B. C. The market is very stiff for both spot and shipment. The European market continues quite active, with more or less daily fluctuations reported. The consumption with us is, as usual at this time of the year, light.

ANTIMONY—The market is strong at another advance. Quotations are about double those ruling one year ago.

LEAD—The market is fairly steady, with the usual consumption reported. The output of the mines in this couutry will show an increase this year over that of 1888.

COPPER—The market is still in an unsettled condition. After advancing Lake at the East to 11c and keeping it steady for a few days, the price fell off again; closing weak. In another department of the paper there is an editorial on the present situation.

IRON—The market continues to hold strong, with still higher prices not at all unlikely. Consumers do not look for lower prices, consequently they take hold more freely. The stock here is growing beautifully less, while the quantity on the way is small.

COAL—Imports the past week are as folows: Coos Bay, 750 tons; Nanaimo, 2324; Australia, 5125; Departure bay, 7100; Seattle, 6541. Total, 21,841 tons. The past week an advance of $1 a ton was made on Gilman and Seattle, and 50c on Coos bay. The market for all kinds is very strong, with dealers and consumers buying quite freely. The low prices are causing many to stock up for winter freer than they usually do. The high rates of freight by both coasters and deep-sea vessels are against lower prices for some time to come. With much of an advance in coast, coast collieries will increase their output.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Sept. 26, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	92¾	$11 00	$3 97½	$21 60
Friday	42½	92¾	11 00	4 00	21 30
Saturday	42½	92¾	11 00	3 95	21 30
Monday	42 9 16	92¾	11 00	3 92½	21 40
Tuesday	42 9-16	92¾	11 00	3 90	21 40
Wednesday	42 9-16	93⅛	10 60	3 92½	21 00

NEW YORK, Sept. 26.—A large quantity of copper is selling, including some from export prices. Lake, $11; Arizona, Montana and other Western, $10.50; Baltimore, $12. The market closed weaker. Pig lead is dull, $3.95 being asked and $3.90 bid. Borax is scarce and higher. Quicksilver is firm at 70@71 cts, under a moderate business.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

PACIFIC TELEPHONE AND TELEGRAPH CO., Sept. 21. Object, the purchase and operation of all kinds of electro-magnetic telegraphic and telephonic rights, also patents, inventions and cables, and to do a general district and local telegraph and messenger business in this State and elsewhere. Capital stock, $5,000,000. Directors—Lloyd Tevis, John I. Sabin, E. S. Pillsbury, W. F. Goad and W. C. Gibbs.

KNAPP & LAWS CO., Sept. 23. Object, dealing in merchandise. Capital stock, $100,000 in 10,000 shares. Directors—E. G. and S. H. Knapp, W. B. Sharp, J. I. Jamison and R. J. Laws.

GOLDEN EAGLE M. CO., Sept. 25. Location, Nevada county. Capital stock, $2,500,000. Directors—Frederick H. Hawsman, Walter Speyer, Alexander Hay, James H. Munday and Frederick K. Shawhan.

STILES MILL AND CONCENTRATOR MANUFACTURING CO., Sept. 25. Object, to manufacture ore pulverizers and concentrators under the Wm. C. Stiles patents. Capital stock, $500,000. Directors—John H. Wise, Wm. C. Stiles, Walter K. Craig, E. W. Roberts and Abraham Halsey.

PACIFIC & OCEANIC TRADING CO., Sept. 25. Object, to deal in merchandise on the Pacific Coast and islands of the Pacific ocean. Capital stock, $50,000. Directors—H. H. Sherwood, R. L. Sherwood, T. H. Minor, C. E. Bowen and C. N. McConnell.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Stonewall, Sept. 21, $8000; Occidental (Real del Castillo, Lower Cal.) $3,000; International Co., $2600; Con. Cal. and Virginia, 21, $45,238; Bluebird, 18, $17,744; Butte and Boston, $32,912; Hanauer, 20, $2400; Hanauer, 21, $2750; Proposso, (Mexico) 21, $60,000; Iago, (Mexico) $65,000; Candelaria, (Mexico) $50,000.

A CAVE has been struck in the Lincoln mine at San Pedro, New Mexico, the ore about which is so exceedingly rich as to have thoroughly excited all the miners in that region. The find is said to be the biggest ever made in the Southwest.

SANDS W. FORMAN, secretary of the State Board of Forestry, is expected home from Europe in October. He has been abroad several months investigating the forestry systems of France and Austria.

THE resumption of coinage at the Carson Mint did not affect the price in the least or create any great demand for silver bullion.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Mining Share Market.

Mining stocks the past week have been quiet, with outside of Alta and Justice only from 2½ to 5 per cent fluctuations in the Comstock. The light fluctuations have naturally brought out more pronounced expressions from the bears and bulls. The former are still looking for lower prices before there is much in the market. This opinion is based on the tight money market; business generally dull, the situation in the Comstock mines pointing to several weeks of deadwork before the character of the result can be known; and in the meantime assessments have to be levied and collected. The bulls are confident of better prices in the near future, based on the following: United States Senator Jones is watching with close personal attention the work going on in the Gold Hill mines, as is Hon. Francis Newlands, which looks well for that end of the lode. Col. Mackay is expected on the Comstock at an early day to give personal attention to the mines in which he is reported to be largely interested, and the work being done and to be inaugurated at an early day is of the most important kind. In running drifts and crosscuts, streaks of ore are liable to be cut at any time which will admit of sharp turns in the stocks. Outside stocks have not been very attractive and did not allow even the quickest chipper to make profitable turns, outside of a very short-lived small spurt in Bodie.

From the Comstock mines our advices report that the Ward shaft is repaired to the water (1850-foot) level, and a station cut out on the 1050-foot level, from which a drift running west was started on last Monday. The Alpha shaft is sunk 50 feet below the 500-foot level. Con. Imperial 300-foot level west crosscut is out over 40 feet in good quartz. The winze that is sunk to connect with the east shaft, by a drift from the bottom, is completed and drift started. Crosscutting on the 500-foot level will be commenced soon after the north drift reaches the Alpha. Yellow Jacket's west drift on the 500-foot level is out about 700 feet. Crosscutting east from bottom of winze on the 1200-foot level of Belcher. The 1465-foot Ophir, north lateral drift, is in nearly 500 feet north of the Union south line. It is claimed by mining-men that important stringers and streaks of ore will be cut in running this drift toward the Sierra Nevada south line. From Mexican and Ophir nothing new is at hand. Con. Virginia is shipping the usual quantity of ore from the 1400 to the 1950 foot level. It is claimed that soon after Col. Mackay arrives, he will probably have the water in this mine pumped out dowe to the 2100-foot level, where a station will be cut and a west crosscut started to intersect the lode now being worked on the 1950-foot level. From the outside mines our advices are growing in interest from both the Quijotoas and Tuscaroras. It now looks as if both these districts will bear more careful watching iu the near future.

The stock market opened this (Thursday) morning strong, higher and active for the Comstocks, and barely steady for outside stocks. Official letters received to-day from the Gold Hill mines are of an unimportant character outside of the information pointing to more active work soon. From Hale and Norcross the official letter reports more crosscuts started, and West crosscut No. 2 on 300-foot level in ore. Official letters from the Bodies report that in Mono below the 1000-foot level they are stoping out ore. From Bodie the letter gives no particular information.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

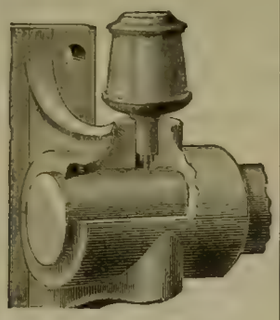
Successful Patent Solicitors.

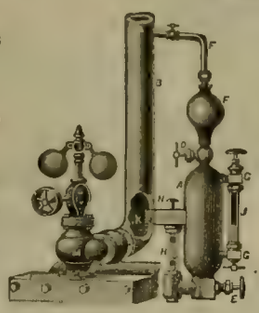


As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. P.) from week to week and year to year.

DURING next winter and spring there will be 427 stamps dropping on Comstock ore, representing a daily crushing capacity of 1300 tons and a bullion yield of $30,000.

AN immense deposit of graphite has been located in the Carlton Pass of the Cowlitz river, Lewis county, Washington Territory. The ledge is eight feet thick.

ALBANY
Lubricating Compound and Cups.

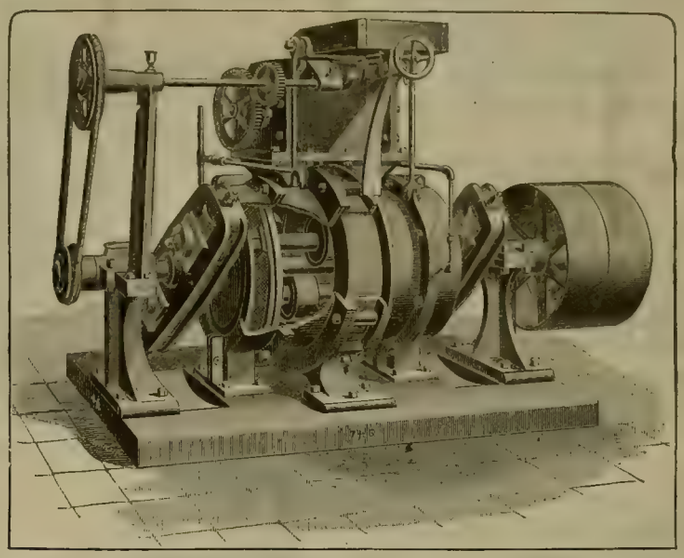


1868.
Manufacture commenced at Albany, New York.

1876.
Introduced by us on Pacific Coast.

1889.
Cheap imitations having had time to show that they are the most expensive in the end, the Sales of the Genuine Albany Compound are Larger than ever before.

England, Belgium, France,
And other Foreign Countries are now Large Consumers.



We are also Sole Agents for the
Albany Cylinder Oils,
Albany Spindle Oils, Etc.

FOR SALE ONLY BY

TATUM & BOWEN,
Sole Agents for the Pacific Coast,
Dealers in Improved Woodworking Machinery,
Sawmill Machinery, Engines, Boilers, Ironworking Machinery, Supplies, Etc.
Sole Agents for Hoe Chisel-Tooth Saw, Gardner Governor, Schultz Leather Belting, Etc.
34 AND 36 FREMONT STREET, SAN FRANCISCO.
85 FRONT STREET, PORTLAND, OR.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.
GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

FREEMAN'S
Dry Process
GOLD SEPARATOR.

They are good machines. If the gold is in the dirt they will save it. They will save finer gold than water will.
T. J. SCOTT,
Osceola, Nevada.

Smith & Drew took out Tuesday, in their dry wash diggings, in addition to 5 ozs. of fine gold, a nugget weighing 22 ozs. The machine used was Freeman's Dry Process Separator.—*Utah Daily Union, May 10, 1889.*

—MANUFACTURERS OF—
Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.
AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or an other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

"RED FLAX CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for water and steam. Packs with less friction and makes a tighter joint than any other packing made. ☞Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. **W. T. Y. SCHENCK**, Sole Manufacturer, **222 and 224 Market Street, San Francisco, Cal.**

DEWEY & CO., {No. 220 MARKET ST. Elevator 12 Front St.} **PATENT AGENTS.**

"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address **H. L. DENIO, Upper Lake.**

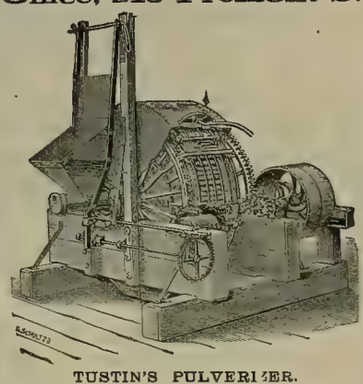
For Mills, Pumping and Hoisting.
OVER 300 IN USE.
All estimates guaranteed. Send for Circular.

QUICKSILVER.

J. B. RANDOL,
320 Sansome St., Room 22,
San Francisco.



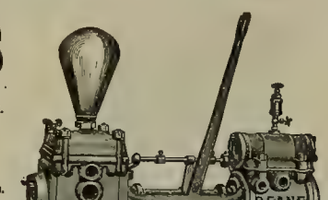
THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
—ALSO—
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ½ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 218 Fremont St., San Francisco.



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—
MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.

DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

N. W. SPAULDING
SAW COMPANY

Manufacturers of
SPAULDING'S
Inserted Tooth
AND
CHISEL BIT
CIRCULAR
Saws.
SAW MILLS AND MACHINERY
Of all kinds made to order. Send for Descriptive Catalogue. **17 and 19 Fremont St., San Francisco.**

Iron and Machine Works.

UNION IRON WORKS,
SACRAMENTO, CAL.
ROOT, NEILSON & CO.,
MANUFACTURERS OF
Steam Engines, Boilers,
AND ALL KINDS OF
MACHINERY FOR MINING PURPOSES.
Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.
Front St., bet. N & O Sts., Sacramento, Cal.

CALIFORNIA MACHINE WORKS,
WM. H. BIRCH & CO.,
ENGINEERS AND MACHINISTS.
No. 119 Beale St., - - San Francisco.
—BUILDERS OF—
Steam Engines, Saw Mills, Mining Machinery, Dredging Machines, Rock Crushers, Cable Railway Machinery, Ellithorp Air Brake Co.'s Patent Steam and Hydraulic Elevators, Air Cushions and Air Brakes. POSITIVE SAFETIES. Improved Ram Elevators, Sidewalk and Hand Hoists. B. E. Henrickson's Patent Automatic Safety Catches.
Machines of all kinds Made and Repaired. Orders Solicited.

Golden State & Miners Iron Works.
Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.
STEVENSON'S PATENT
Mold-Board AMALGAMATORS,
Golden State Pressure Blowers.
First St., between Howard & Folsom, S. F.

THOMAS THOMPSON THORNTON THOMPSON
THOMPSON BROTHERS,
EUREKA FOUNDRY,
129 and 131 Beale St., between Mission and Howard, S.F.
MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

MINING ENGINEERS.

CIVIL AND MINING ENGINEER
Of long experience, practical and administrative, in Copper, Silver and Gold Mining in Europe and America, offers services as Manager or Superintendent, or to search for and report on Mines. Now in Mexico. Several languages. Address C., F., Box 25.7, San Francisco, Cal.

W. A. GOODYEAR,
Civil and Mining Engineer,
MINING EXPERT AND GEOLOGIST.
Address "Business Box A," office of this paper, San Francisco.

ROSS E. BROWNE,
Mining and Hydraulic Engineer,
No. 307 SANSOME ST., SAN FRANCISCO.

ISRAEL W. KNOX,
Mining and Mechanical Engineer
AND PURCHASING AGENT FOR
Mines, Mining Machinery & Supplies.
Mines Examined, Reports and Estimates Furnished, Contracts made, etc.
Office, 237 First St., San Francisco, Cal.

GO TO
American Exchange Hotel,
Sansome St., San Francisco.
One door from Bank of Cal.

Rates $1, $1 25 and $1.50 Per Day. Free Coach.
The above Hotel is situated in the midst of the Banking and Commercial Houses of the city, and is by far the most home-like and desirable Hotel to stop at.
CHAS. & WM. MONTGOMERY, Prop'rs.

INVENTORS, TAKE NOTICE!

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

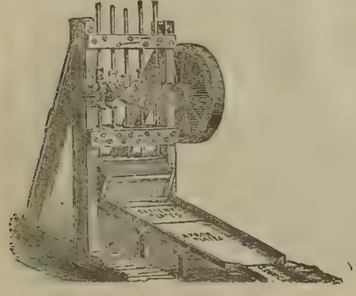
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

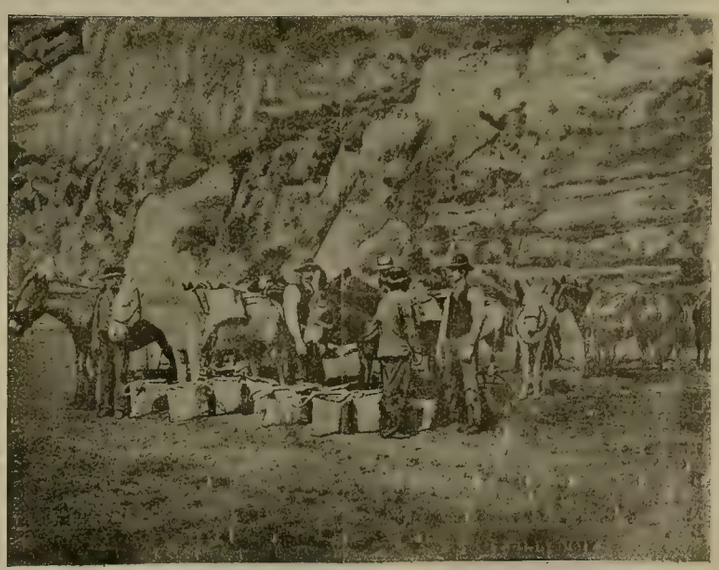
Beach Sand Mining.

We give herewith two photo-facsimiles of scenes on the beach at the Gold Bluff black-sand mines, Humboldt county. The deposits in this region created much excitement some 36 years ago. They extend from Oregon creek eight miles in a southerly direction. The whole line of the beach was worked for the gold the sand contained. This deposit of black sand contains traces of platinum, osmium-iridium too minute to have any commercial value, but with sufficient gold to make the business of gathering it lucrative. From the date of discovery to the present writing these beaches have been annually worked, success depending, more or less, on the occurrence of fierce gales of wind in the winter-time, and the consequently heavy surf that breaks along the shore. These black sands, as they are called, come from the disintegration of the bluffs facing the ocean, and which rise nearly vertical to a hight of from 100 to 800 feet above sea level. The bluffs are a formation of auriferous gravels deposited by the Klamath and its tributaries, the main river emptying into the sea centuries ago at this point. The bank caves, and the retreating waves carry the lighter detritus seaward, while the metallic portion remains on the beach in thin sheets, which the miner gathers and washes. This gold is from 900 to 950 fine, and sells for $19.50 per ounce.

One of the engravings shows a place on the beach known as the Widow's cave, and the other shows a party engaged in packing the auriferous sand. The sand is gathered and placed in sacks on the backs of mules, and is then carried to where water is available for washing. Only the concentrated or black sand is gathered. In one of the articles recently contributed to the PRESS by Jas. H. Crossman, these beach mines are fully described. We are indebted to that gentleman for the photographs from which these views were made.

HYDRAULIC MINING IN SISKIYOU COUNTY, CALIFORNIA.

Hydraulic Mining.



Notwithstanding that the hydraulic mines which were on tributaries draining into the Sacramento and San Joaquin rivers have been prevented by injunction from carrying on work by that process, there are still numbers of these mines being worked in the more northern portion of this State. We give on this page a typical scene in Siskiyou county. The cut was made direct from a photograph without redrawing. It shows the giant throwing its heavy stream against the bank, a mass of falling water from above, and the character of the bank itself.

These gravel banks are all of the same general formation, but vary more or less in hight, and in the amount of gold in the gravel. Great masses are undermined by the water and then broken up and washed. Powder is used to shatter and loosen the gravel while "in place," making less work for the water to do. In the series of articles on the "Northern Counties of California," recently published in the PRESS, the gravel-mining regions of Siskiyou county were fully described.

THE four miners who left Virginia City last June for Corea, under contract to the Corean Government, are now going about Seoul, which is two months inland, without money or employment. The Coreans will not divulge the situation of the rich mines, for one of which a stamp-mill has been sent out, and the Government evidently does not remember its contract.

GOLD BEACH AND BLUFFS, HUMBOLDT COUNTY.

PACKING AURIFEROUS SAND AT GOLD BLUFFS.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

El Dorado County.

The Mining and Other Interests.

EDITORS PRESS:—The county is bounded on the north by Placer, on the east by the State of Nevada, on the south by Amador, and on the west by Sacramento county. It contains within its limits 1800 square miles, or 1,152,000 acres, making the county nearly 70 miles in length by 35 in width. The eastern part of the county is mountainous and is devoted principally to grazing and mining, though here and there, in favored spots, many profitable ranches and comfortable homes are to be found. Throughout the entire belt fruit culture comes to the front, while in the lower portion of the county adjoining Sacramento county the ranches produce hay and grain, besides raising a large amount of stock. This valley section possesses all the advantages of its sister, Sacramento county, in its adaptability to the raising of the fruits of the citrus family. At the present time the most prosperous and densely populated portion of the county is in the neighborhood of the county seat—Placerville—while there are a number of fine fruit-ranches from Shingle Springs to Diamond. It is the section from Diamond Springs up and across to Placerville, then out over the hills east and on to Coloma, that shows how well this belt is adapted to the production of fruits and grapes. The fruits of Coloma and the high-colored grapes of that section are eagerly sought after and command at all times the highest market prices. All orchard products vie with each other in their size, color, flavor and keeping qualities.

The Original Gold Discovery.

El Dorado claims the distinction of being both the pioneer and empire county in the discovery and production of gold. On the 19th day of January, 1848, J. W. Marshall picked up in the tail race of Sutter's sawmill the first gold found in California. While the chispa weighed but six pennyweights and 11 grains, it held in its evidence of the royal metal the promise of greater wealth than any similar weight of matter in the world's history.

Marshall's discovery was purely accidental, and it remained for Isaac Humphrey, an old Georgian gold miner, to fully show the value of the discovery and to introduce the proper means of collecting the metal by starting placer mining. Messrs. Sutter and Marshall's system of "tithing" or demanding one-third of all the gold extracted from the placers on their ground, proved irksome and the miners soon moved down to Mormon Island, where rich diggings were discovered. This led to prospecting throughout the entire State, the finds on the Calaveras, Mokelumne, Stanislaus, Yuba, Feather, Trinity, Klamath and Scott rivers following in rapid succession.

In 1850 the county was organized, with Coloma as county seat. Placerville soon grew ahead, and in 1856 the seat of the county was moved to Placerville to remain. Placerville was then an incorporated city. The county extends from the plains of the Sacramento on the west over a dividing range to the line of the State of Nevada on the east, a distance of 60 miles, and from the Middle Fork of the American river on the north to the South Fork of the Cosumnes river on the south, comprising an area of 1800 square miles.

Gold Output.

It is estimated that the placer mines of El Dorado county yielded fully $100,000,000. In the first workings of the placers the gold was extracted in the most primitive manner. Knives, bars, spoons and the fingers constituted the means. To these followed the batea and the rocker; then followed the "long tom," as introduced by Georgia miners. Following these came the sluice.

Famous Camps.

The old diggings on American river were Mormon Island, Condemned Bar, Long Bar, Doton's Bar and Whisky Bar.

On the Middle fork of the American river, from the junction upward, were Oregon Bar, Louisiana Bar, New York and Murderer's Bar, Wildcat, Willow, Hoosier, Green Mountain, Main and Poverty Bars; also Spanish, Fords, Volcano, Sandy, Grey Eagle, Yankee Slide, Eureka and Boston Bars, with Horseshoe and Junction Bars at the mouth of State ravine. On these bars of the Middle fork of the American, not less than 1500 men were engaged in mining in 1850, a claim being a piece of ground 15 feet in width extending across the river and back to the hills. One of the richest strikes was that at "Big Crevice" crossing the Middle fork of the American river at Murderer's Bar. At Hoosier Bar the hydraulic was brought into use and marked the greatest improvement in gravel mining.

The first mining company chartered in this State was the Boston Bar Co. of the American river in El Dorado county.

On the South fork of the American river were Dutch, Kanaka Red, Stony Ledge, Missouri and Michigan Bars; on the Cosumnes river, Big, Michigan, Buck's, Pittsburg and Wisconsin Bars.

Yield of the Bars.

Of the output of the various bars on the Middle fork of the American river, the following estimate gathered from most reliable sources will give a faint idea of the amount:

Volcano Bar	$1,500,000
Greenhorn Slide	1,000,000
Yankee Slide	1,000,000
Sandy Bar	500,000
Merken Cut Bar	200 000
Mud Canyon	2,000,000
Nigger's Bluff	500,000
Grey Eagle Bar	800,000
Eureka	100,000
Horseshoe Bend	2,500,000
Boston	100,000
American Bar	3,000,000
Willow Bar	600,000
Junction Bar	150,000
Missouri Canyon	800,000
Grizzly Canyon	300,000
Otter Creek	400,000
The Hills	300,000
Total	$16,750,000

Dry Diggings.

While the bars held the crowd by reason of their great wealth and the water supply, the dry gulches soon attracted attention. The first water ditch in the mining regions of California was that at Coloma, built in 1850 to 1851. This water found eager purchasers at $1 an inch for 12 hours. Drift mining or "coyoting" of the old river channels followed the working of the gulches, and soon led to the use of the hydraulic system, the invention of Mr. E. L. Mattison. On the Georgetown divide deposits were found from Pilot Hill to Greenwood, varying in depth from 25 to 300 feet. South of the South Fork of the American river is the great river channel commencing at White Rock circling thence through Smith's Flat to Coon Hollow. This channel and its spurs—Nigger, Clay and Indian Hills—proved exceedingly rich. At Coon Hollow alone, over $5,000,000 was extracted from the mines of that section. Oregon ravine proved rich, as did Spanish Hill and Tennessee Hill. Drift mining in Cedar Ravine also proved profitable. From the Lyon channel claim at Prospect Flat 15 acres of ground yielded $200,000. A rich channel crosses from Iowa canyon to the valley of Weber creek. There is also a deposit between the forks of Weber creek, while the south bank of the stream shows a continuous mass from above Newtown to Diamond Springs. South, Dry gulch, Park and Camp creeks, with all the branches of the Cosumnes, show auriferous deposits. Extensive mining fields were found at Dry Gulch, Henry's Diggings, Grizzly Flat, Brownsville, Fair Play and Indian Diggings.

Seam Mines.

These mines are peculiar. The rock is of porphyry with gold bearing quartz seams running through it in all directions. It is a question whether the breaking up of this porphyry belt was the source of the great deposits in the rivers, gulches and basins lying below, not only in El Dorado, but all along the line of the Mother lode from Mariposa north. This immense bed or vein of mineralized porphyry parallels the "Mother lode." In many respects it is similar to the Bonanza mine of Sonora. On the French mine at Greenwood a large amount of work has been done and about $250,000 extracted. Here the loose decomposed porphyry, to a depth of 30 feet, was washed off with a hydraulic and the free gold caught in the sluices. On the Shaw mine at El Dorado the porphyry ledge is 138 feet wide. The east side of the vein was worked in an early day to a depth of 75 feet and over $100,000 extracted. At present from one to four feet, next to the walls, is found to yield $20 a ton. The vein is here 1000 feet west of the Mother lode. Mr. George Hearst estimates that the entire zone will go $3 to the ton. Amador, Calaveras, Tuolumne and Mariposa counties have done no work on this belt.

Pockets.

In the neighborhood of Placerville are numerous pocket mines, while the same can be found in all the quartz veins of the county.

Copper.

The serpentine belt crosses the county, and, as in Calaveras and Amador, carries copper at Bunker Hill, Hastings Ravine, Pilot Hill, and at the Cosumnes copper mine.

Silver.

Silver was discovered on Spanish Flat, near Kelsey, the ore assaying $100 to $150 to the ton and $6 in gold.

Cinnabar

Is found in several parts of the county. An eight-foot ledge near the Amador line is said to carry 20 per cent metal.

Iron Ore

Is found in a number of places throughout the county, but it is not worked for the iron. East of Negro Hill is an extensive chrome-iron mine.

Asbestos

Is found on the Georgetown divide; granite, marble, limestone, sandstone, and slate are in large supply.

Slate.

The Chili Bar Slate Co. have a breast of 60 feet and face of 75 feet. When opened they will be able to quarry from a breast 1500 feet high. At present they are shipping a carload a week from their 40-acre mines. The slate brings $7 a square foot and is being used very extensively by the S. P. R. R. for their stations. This slate splits readily, has a smooth cleavage, and is remarkably tough in its texture.

The El Dorado Big Tunnel.

This tunnel is being driven to crosscut the mother-lode belt, 1200 feet deep. In driving this tunnel a belt of fine slate 50 feet wide was cut through, and is a bonanza in itself. The tunnel will show the formation across the belt, and as the company has eight locations on the belt, the enterprise cannot prove other than a most profitable investment for capitalists.

Quartz Mining.

The mother lode crosses El Dorado county, and here, as elsewhere along its line, the best mines are found on its belt. At El Dorado, the Greenstone, a contact vein between the serpentine and metamorphic slate, is under bond to a Placerville company, who are rigging to develop thoroughly. The old workings show a three-foot ledge to a depth of 265 feet. The ore of this mine is said to run up in the hundred of thousands in tellurides.

The Church mine dates back to 1852, when from a shaft 31 feet in depth quartz yielding $36,000 was extracted. The mine then lay idle until Mr. Church gained possession, when a shaft 400 feet deep was put down on the vein, which proved eight feet in width, though often going to 12 feet. A 10-stamp mill was erected and from the last 14 months' run of 6000 tons of quartz $100,000 was extracted. The mill was then shut down and the present three-compartment vertical shaft started. The present hoist will enable the owners to sink to a depth of 2000 feet. Over $85,000 has been expended in the last year on the plant. The lode lies 1000 feet east of the mother lode, with diorite hanging and talc footwalls. At this writing the Church mine is counted the best mining property in the county.

The Tullis mine is on the same vein as the Church, and lies three-fourths of a mile east of it. In the early workings of 1854, 100 tons of the croppings were milled and gave an average of $140 a ton. In the present shaft three parallel veins are found, making a five-foot ledge, the ore from which to a depth of 150 feet has given $35 to $75 a ton. A new hoist has just been erected, and Sup't D. W. C. Morgan expects to prove the mine a bonanza.

The McNulty has just been sold for $32,000. Other mines on the belt are being developed.

At Placerville,

The principal mine is the Pacific, with the well-known Thos. Price of San Francisco as president. This property is being put in shape for extensive operations. Two shafts 700 feet apart are being put down 800 feet and then connected by drift. The main shaft will be continued on down to a depth of 1000 feet before the mill is started. This ledge is 20 feet wide at bottom of present 800-foot shaft. The company owns five mines on the ledge, and has purchased the old El Dorado water-ditch. Once in operation, this property will soon speak for itself. Mr. Price regards this as the best mining property he has ever seen.

At Grizzly Flat,

The Mt. Pleasanton is running a prospecting tunnel. The North End is idle for want of water, as is the Milton. Morey's mine, a 20-inch ledge of $30 rock, is now under bond.

The Sunday will soon start up on a two-foot ledge of $30 rock. These mines are in granite.

At Garden Valley,

The Ivanhoe vein was bonded by inexperienced parties who sunk 60 feet on the dip of the vein. At this point the vein changed to vertical, but the superintendent continued on down to 200 feet in depth on the same angle, and then drifted 50 feet from the vein in the footwall.

The walls are slate and porphyry. The ledge is three feet in width, carries 20 per cent of sulphurets, and gives $6 a ton in free gold.

The Lone Jack mine is being thoroughly developed. The vein is the mother lode proper. The shaft is now down 415 feet. The vein is 45 feet wide, 10 feet of which mills $11 a ton. The hanging-wall is diorite; foot, talc-slate. The company has a 10-stamp mill which is idle during developments.

The Rosencrans, a three-foot ledge of $11 rock, joins the Lone Jack on the East, and is opened to a depth of 200 feet. This mine has a 10-stamp mill. The property is idle at present.

The Taylor joins the Rosencrans on the east. It has a 10 stamp mill and is developed to a depth of 500 feet, with 340 of drift on the 10-foot ledge of $8 rock. The property is now being developed.

Cement Mines.

The mills on this Old river channel are closed for want of water. At the Chile Ravine mine, Coon Hollow, a tunnel 2000 feet long is being driven to strike the bedrock. This will be the first tunnel to reach that depth. Naturally the project attracts considerable attention, as it promises to reveal exceedingly rich ground. Up to this time the work has all been on the upper benches. These drift mines give promise of yielding a steady output of the yellow metal for many years to come. By reason of their extent it will be a century before they are exhausted. On the line of the mother lode the land is owned by the present mining companies, or covered by agricultural patents, thus closing the door to prospectors. The eastern part of the county is still open. That El Dorado will in the near future make an enviable record as a gold mining county is evident.

Principal Towns.

Latrobe, sitting at the entrance of the county with an altitude of 769 feet, does not impress the stranger favorably, but a drive out into the Barton valley, lying back of the town, will show that in the future this section will come to the front, as the temperature is such that all of the tender fruits can be raised to a profit. If the large ranch of Mr. H. Barton should be subdivided it alone will furnish homes for hundreds of families. Latrobe is on the line of the railroad and has a population of about 100.

The next point on the railroad is Shingle Springs. Until two years ago this was the railroad terminus; now that the road is extended to Placerville, Shingle Springs has become a quiet way station, with a population but little larger than Latrobe. The country surrounding is more thickly settled, trees and vines are grown on every side.

El Dorado is but a duplicate of Shingle Springs, with perhaps two hundred inhabitants. There are a number of fruit ranches in the immediate vicinity and some very rich quartz mines. The town has the appearance of having "lost its grip;" the mines of the vicinity should infuse new life into it, but as "all roads lead to Rome" so here all roads lead to Placerville, and the trade of the county seems to have settled there.

Diamond Springs wears a neat appearance, and well she may, for here the best fruit farms begin. From this town up the hill and across to Placerville there is a continuous line of fruit trees.

Pilot Hill and Cool are small villages of but a few houses, as is Garden valley. Greenwood makes a very fair showing and gives evidence of thrift.

Georgetown is quiet, but next to Placerville is the best town in the county. The best feature of the town is the American hotel. Numerous stores well stocked and largely patronized show the section to be both populous and prosperous. Many fine residences adorn the streets and add to the look of thrift that the town wears.

Placerville is the county seat and terminus of the railroad. The altitude is about 1800 feet. The town stretches along a ravine and shoots off in spurs along the hillside. Surrounding are high hills giving the town a valley look. The population is estimated at 2500. The fact that all the trade of the county centers here brings in a large floating population and the trade of almost the entire county. By reason of this fact Placerville is unusually prosperous and wears the appearance of an inland city. While the most of the old mining towns of the county show evidences of past glory, Placerville gives every indication of a prosperous present, while the great mineral wealth of the county and the future in fruit-culture assure still greater prosperity in the near future.

Coloma is difficult of description. I think the visitor will agree with me that its appearance is such as would indicate that the Aztecs once occupied this lovely spot, but that it was in the long ago. The town wears an out-at-the-elbows look, though here and there are pleasant homes. Standing on the knoll of the Marshall monument site and looking down upon the town and across the river to the green fruit orchards with the encircling hills, while the river runs lazily by, unheeding Marshall's finger as he points from his monument to the spot where gold was first discovered in California, the view is beautiful in the extreme. Why Coloma has not been sought out and her beauty enjoyed by large numbers of visitors is difficult to understand, as the Coloma Vineyard hotel offers every comfort to the visitor, though the neglect of this fine vineyard must strike the visitor as little else than sinful. From the immediate vicinity of Coloma are shipped the greater portion of the best fruits grown in the county.

Water Supply.

The middle fork of the American river with its branches—the South Fork with its branches, Blackrock, Greenwood Rock and Silver creek on the north—Weber, Plum, Mill, Alder and Alpine creeks on the south, with numerous smaller creeks, spread all over this immense basin. On the south the Cosumnes with its various forks and tributaries form a complete network over the southern portion of the county.

The California Water Co., El Dorado Ditch Park, South Fork, Gold Hill, Iowa, and Weber canals carry water to all parts of the upper section of the county, from Lotus on the north to Shingle Springs on the south, including about seven-eighths of the area of the county, brings the rancher and fruit-grower within the reach of the city markets in addition to those of the county.

E. H. SCHAEFFLE.

The Stewart Mining Bill.

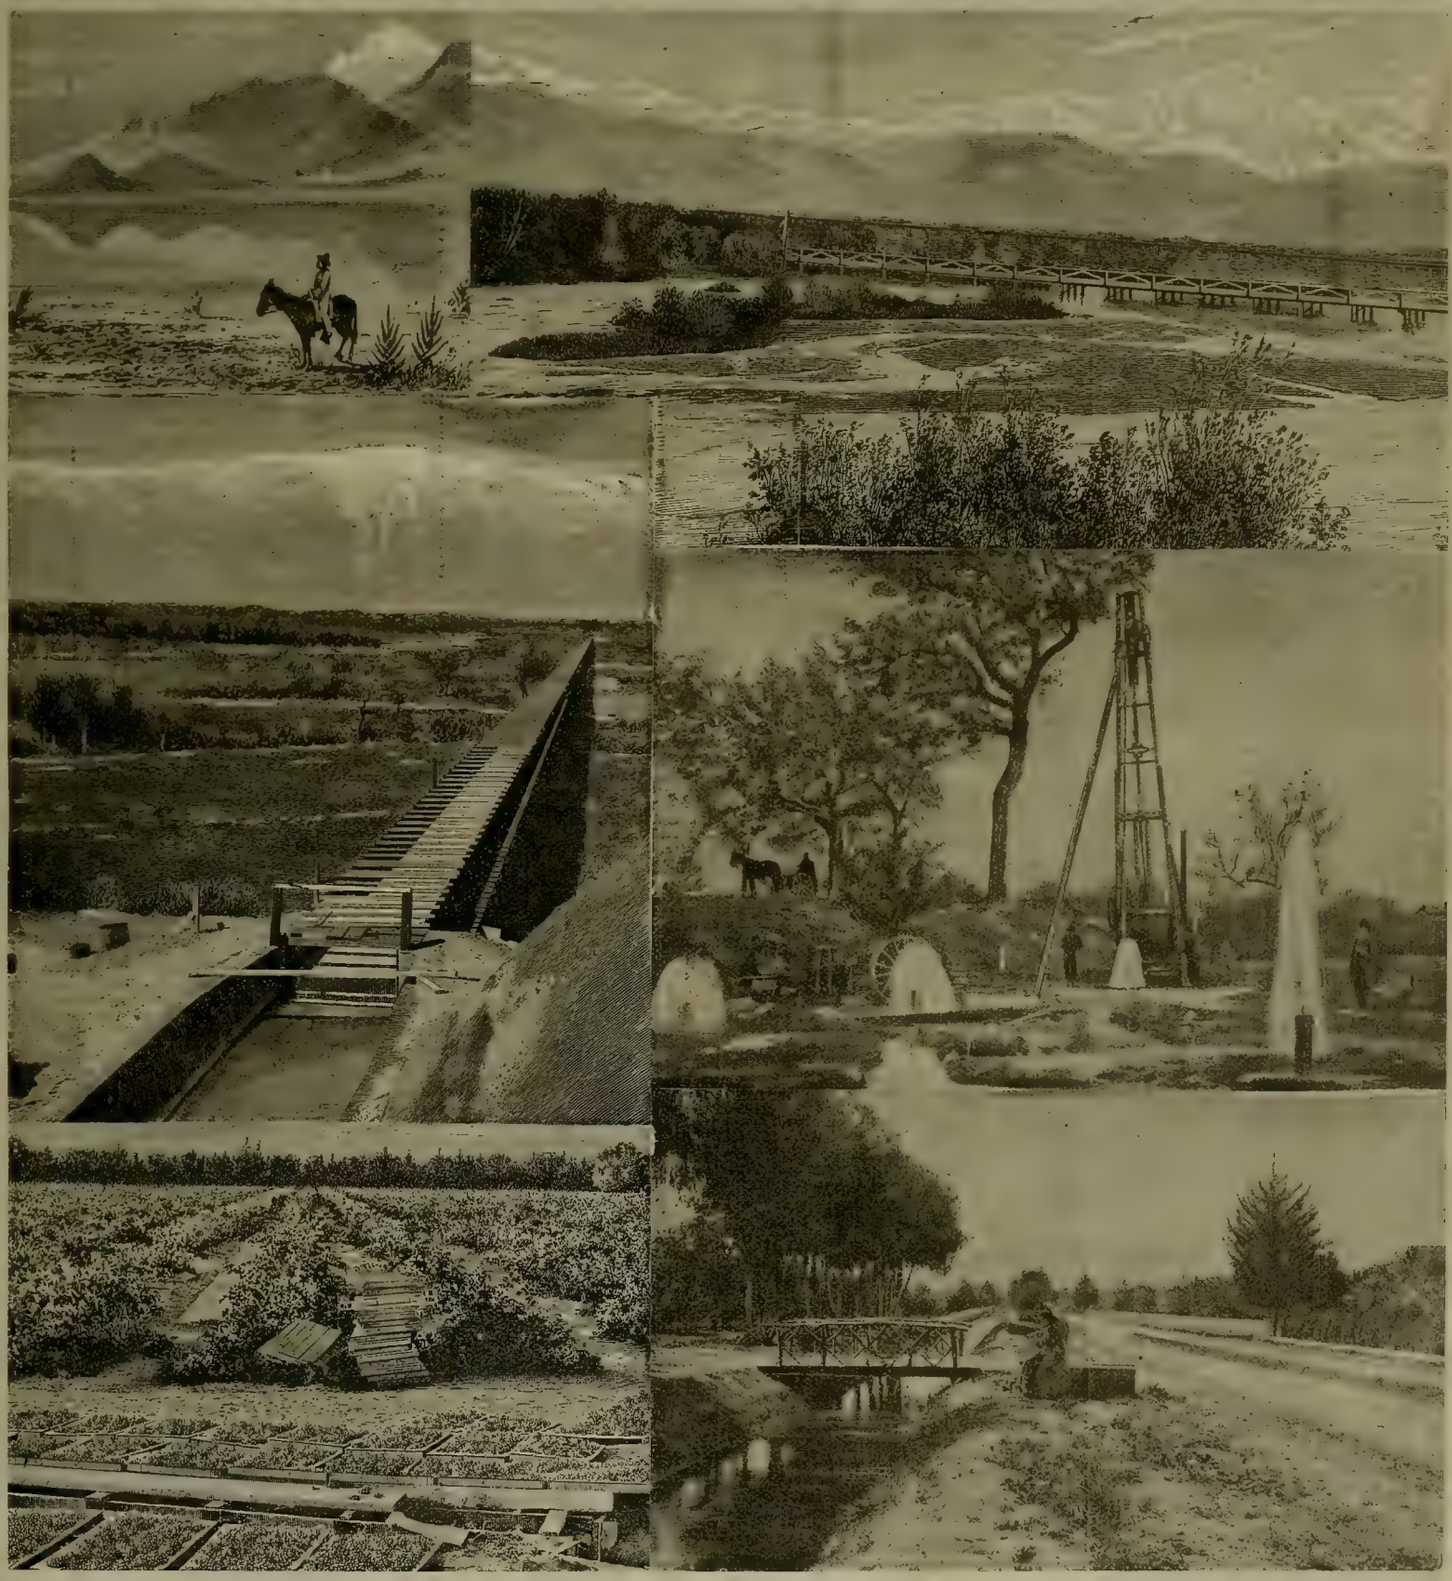
EDITORS PRESS:—I hope you will, in your valuable journal, oppose the proposed Stewart Mining Bill for the following reasons:

1st. Miners are willing to develop and spend $100, and more, too, on their claims. But speculators and farmers who do not farm would like to have a *law* that would only compel them to post notices, renew them, and scratch the surface, holding the mining ground from year to year without making any improvement.

2d. It is absurd and unjust that a miner who has abandoned a claim should not after a lapse of time relocate the same; he might by a new exploration make a valuable discovery, covering the identical ground that was claimed by his first notice.

3d. Inside of a year after a location the miner should have sunk a shaft or run a tunnel

of at least 12 feet, and the same amount of work to be done every year.



4th. Absurd that a miner should go and post a notice of abandonment.

5th. It is very inconvenient and expensive that a miner should file an affidavit with the County Clerk that he has made $100 worth of work or improvements on his claim. Miners will find out if the requirements of the law have been complied with. E. C.

MINA DE MULATOS.—Last week Alvinza Hayward, representing a syndicate of English and San Francisco capitalists, purchased from Wincesloa Loaiza, acting for the Mexican owners, the Mina de Mulatos, a valuable mining property situated in the State of Sonora, for $1,575,000. The mine has been worked for over 80 years, but Mr. Hayward is evidently confident of the wealth yet hidden away in its recesses, for he has taken a 55-per-cent interest in it, and has mortgaged his property in this city to the sum of $865,000 to pay for it. The remaining 45 per cent is in the hands of London capitalists. Sixty stamps are at present dropping on quartz that assays from $10 to $13 a ton and of which there is a whole mountain. The mill will shortly be increased to 100 stamps, and every appliance of modern mining industry will be used to develop the wealth of the property.

From Waste to Wealth.

Figures rightly used are strong supports for argument, and accurate descriptions produce deep impressions, but neither statistics nor word-painting appeal so forcibly to most minds as the significant lines of the artist or the unerring representation of the camera. These facts are suggested by a study of the composite engraving on this page. We doubt whether a volume of orchard reports, assessor's figures or eloquent description could teach so forcibly the story of the deeds of water in California as do these few pictures arranged in the order of their industrial sequence. A few words of interpretation will place all in the way of obtaining their meanings.

FROM WASTE TO WEALTH—THE WONDER-WORKS OF WATER ON OUR ARID SOIL, AS ILLUSTRATED AT RIVERSIDE, CAL.

In the greatness of its transformation from waste to wealth Riverside is typical of the service rendered California by irrigation enterprises. What Riverside was in its natural condition is shown in the little sketch in the upper left-hand corner—an expanse of arid land supporting a population, according to some accounts, of a single sheep-herder. But above the expanse are the snow-capped mountains, treasure-houses whence are to be drawn the future wealth of the region.

In the next picture appear again the snow-capped mountains, and at their base the Santa Ana river, which for ages has sought the sea through a wide belt of moist lands, while the rich mesas burned in the sun and were thought worthless.

Adjacent to the river scene is a glimpse of the artesian wells, through which the pierced earth gives forth abundant water from unseen streams also pursuing their course from the mountains to the sea.

On the left again is the flume carrying the precious fluid from river and well flow miles away to the land, which, at its touch, becomes fruitful beyond compare. In the wells and the flumes are suggestions of the enterprise which is needed from mankind to make available the water treasures of the mountains and the soil riches of the arid lands.

And then the results—need they be more than suggested? Where the lone sheep-herder of 18 years ago looked out upon the arid plain, there is now a population of 7000. Twenty years ago the assessed value of the territory was $3500; now it is $4,000,000. But one does not need such data for forming judgment. Contrast the desert of the upper corner of the engraving with the profuse production indicated by the vineyard scene or the improvement of the landscape as shown in the view of the growth of ornamental tree and shrub, all of which appear in the lower divisions of the engraving.

THE MONTERREY "LOST MINE."—The long-lost treasure in Carmel valley didn't amount to anything. All experienced miners who have seen the rock and claim pronounce it worthless. There is some lead and iron, with the slightest possible trace of silver. All this country has been prospected thoroughly and considerable money expended in trying to find it. The tools young Foreman found are some that have been abandoned by former prospectors. Olsen & Foreman have quit work on their claim, and the Old Woman's mine is still undiscovered.

A NATURAL-GAS WELL IN SALINAS.—Under date of Sept. 25th it is reported that Daniel Coy has been having a seven-inch well bored on his place, and when a depth of 66 feet was reached a flow of gas was struck which is now sending up a flame six feet high.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

THE DROUTH AND MINING.—Calaveras *Prospect*, Sept. 28: The drouth has affected mining interests to a considerable extent, and those mining enterprises dependent on water as a motive-power had to suspend work altogether or to limit the number of employes. The Norfolk Co. ceased work entirely, and the superintendent, J. B. Moore, went East. But we are pleased to note that miners have again gone to work preparatory to active operations when water insures a continuance of an abundant water supply. Across the Stanislaus, the Sailor Boy, near the Collier district, is sailing along with flying colors, and three shifts running. A rumor reaches my ear that they have struck in the tunnel a narrow but exceedingly rich ore streak. The Total Wreck, adjacent to town, is working one shift only. The superintendent has moved his family to town, and more active operations will be the order in the near future. The shaft has attained a depth of over 100 feet; the vein at this depth is three feet wide; water retards the working at the depth, and a pump will soon be placed in position. The Beatrice in close proximity and running parallel to it, though not worked at present, still claims the attention of mining men, several of whom have inspected it quite recently. Sperry's iron mine, within two miles of town, is being worked by tunnels, and the outlook is very encouraging for a remunerative property; gold and silver is found in the ore, and it is probable that it will pay to work for these minerals alone. George Sperry of Stockton is the principal mover in this enterprise.

THORN MINE.—*Citizen*, Sept. 28: In what is known as the Bear Mountain district there is known to be some very rich quartz, floats having been found in various places and good prospects in many instances. Last Saturday we visited a prominent mine in this section—the Thorn—on the Copperopolis road, about five miles from this town. Mr. Thorn has had two shafts sunk upon the claim—one 40 feet and another 80. About 50 feet from the 80-foot shaft the new management, under the superintendency of Mr. Arrowsmith, has sunk a new shaft, which has now reached the depth of 100 feet, and levels are being run from here north and south through a fine quartz vein. From an old cut run by Thorn, about 75 or 100 feet from the new shaft, we took a handful of loose quartz, which when pounded up in a mortar showed more gold than could be taken up on the point of a penknife, and we found the same good prospect anywhere on the seven to ten foot vein. The vein at 100 feet will also show gold and an immense quantity of rich sulphurets.

El Dorado.

LONE JACK.—Placerville *Observer*, Oct. 1: The shaft at the Lone Jack mine, Garden Valley district, is down 400 feet. At that depth they have 14 feet of ore, showing gold and a fair percentage of sulphurets. The full width of the vein is not yet known, as they have not cut to the east wall, nor do they intend to do so until they have reached a depth of 600 feet.

DONCASTER.—At a depth of 114 feet in the Doncaster mine, they have struck a volume of water, making it impossible to sink deeper with a horse-power whim. The company will probably run a tunnel from its millsite, from which point they can strike the ledge about 225 feet below the surface. This will give them a large body of ore to work, as the ledge of pay ore at the bottom of the shaft is about 9 feet wide. The ore is of a good grade.

ROGERS.—At the Rogers mine at Smith's Flat, they are now working in a bench of cement gravel supposed to be extensive and of high grade. Mr. Fred Benfeldt, an old gravel miner, who is well acquainted with mines in that district, gives it as his opinion that there is enough practically in sight to keep the mill running for years.

FREE GOLD.—The shaft at the Bobby Burns mine at Blair's district is down nearly 80 feet. The ore at water level seems to increase in richness, showing more free gold and a greater percentage of sulphurets. The ledge at the bottom of the shaft is about 5 feet wide.

Inyo.

LOOKOUT DISTRICT.—Inyo *Index*, Sept. 25: Frank Fitzgerald, lessee of the Modoc Con. mines, has resumed work on that property; he will also start up on the Minnietta property about the first of October.

CERRO GORDO is fast returning to its old-time glory. The Union Con. now has 50 men employed and the force is being gradually increased. Supt. Farrington is in charge, with James McDonald as foreman.

Nevada.

THE ELEVATOR PROCESS.—Grass Valley *Union*, Oct. 2: The plan that the Milton Mining Company, at French Corral, is adopting to work its gravel claim at Empire Flat is regarded with much interest by the people of the vicinity, as upon its success there will be a partial return of former prosperity to that portion of the ridge. The former hydraulic operations of the company removed a large amount of gravel, and has left a basin at French Corral which will hold an enormous quantity of debris, if the plan of raising the gravel by the hydraulic-elevator plan at Empire Flat, one-half mile distant, proves practicable. This plan is to force the gravel from the bed of the claim up an incline plane by means of a powerful stream of water under pressure, the gravel raised in this manner being deposited in a sluice lined with the usual gold-saving appliances, and from thence passing off into the basin in which the debris will be impounded. This is a much more expensive mode of hydraulicking than by the ordinary mode, as it requires a large amount of water to remove a much less amount of material. To make such mining profitable, the pay gravel must be good, otherwise the cost of the water would eat up the profits. In the case of the Milton Co., it owns its canal and water, which will lessen the cost of the proposed operations, but as to companies owning gravel ground and compelled to purchase water at the usual rates, it is considered that the elevator process could not be made profitable. With the Milton Co. its present enterprise may prove profitable, as the ground is considered good, and by the plan adopted the work can be carried on without any violation of the injunction restraining the company from running mining debris into the rivers or their tributaries.

EMPIRE.—*Tidings*, Sept. 30: It was not intended until the last moment to lay off the majority of the day's-pay men at the Empire until tonight, the last of the month. Those drafted number but 50 men and boys, the majority of whom have already selected tribute pitches in the mine, while others will bid for contracts. The tributers and contractors at the Empire, numbering about 80, have been making from $2 to $3.50 a day right along, and the men laid off Saturday evening will undoubtedly do as well. In the meantime the work of sinking the shaft will be pushed with all speed, and within four months it is confidently believed an increased force of miners will be at work on day's pay. All indications point to the consolidation of the ledge at or about the 2000 level, such as occurred thrice previously in the history of the mine. The "old Empire" will outlast mines yet unknown.

THIRTY DOLLARS A DAY APIECE.—Nevada *Transcript*, Sept. 27: Chas. Adolph and Will Hart have just concluded a rather unusual but profitable mining operation in the ravine just south of the city plaza, where L. C. Keith's custom quartz-mill stood so many years. In seven days' washing of the sands and dirt they cleaned up $420 worth of amalgam, which gave them $30 a day apiece for their labor. The gold had escaped from the mortars and run off in the waste. They are looking around for more old mill-sites.

THE HARTERY.—*Tidings*, Oct. 2: Steam was turned on at the Hartery, Monday evening. The machinery ran smoothly and to the entire satisfaction of contractor and superintendent. An eight-inch pump is now being put in the incline and will be ready for business by the last of the week. The shaft is 600 feet in depth, with a drain tunnel at the depth of 225 or 250 feet. As the workings, aside from the shaft, are not extensive, it is expected to have the water out within a month.

HOISTING WORKS COMPLETED. — *Transcript*, Sept. 29: C. C. Weisenburger, who had the contract for constructing the hoisting works on the Harmony drift claim, a short distance northeast of town, made an excellent job of it. Steam was started Wednesday and a trial run made, all the machinery moving smoothly. The works will begin Monday to run regularly. The incline shaft is down 135 feet and has nearly 200 feet more to go to reach bedrock.

EMPIRE MINE.—Grass Valley *Union*, Sept. 29: A number of Empire miners were laid off yesterday, leaving but few underground men at work except tributers. The Empire has not been looking well for some time, but the prospecting operations that are going on are expected to lead to favorable development. The old mine has had a number of ups and downs in its long and eventful history, but it always comes up smiling in the end.

NORTH STAR DIVIDEND.—Grass Valley *Union*, Sept. 28: In to-day's *Union* will be found a notice that the North Star Mining Co. will pay a dividend of 50 cents per share on and after the 30th inst. The dividend will aggregate $50,000, which makes the fourth one of that amount declared by the present company. The mine is now yielding good returns and giving promise of future large dividends.

Placer.

PICK AND SHOVEL.—*Herald*, Sept. 28: Report has it that the mill at the Drummond quartz mine is running and the ledge promises well. Work in the Mountain Gate mine at Damascus has been suspended. The main tunnel at the Red Point is being driven ahead. Superintendent Dodge is still running prospect drifts in the Baker Divide claim. Hoisting works will be put up at the Bellevue in a few weeks. At the Hogsback they are boring to find the distance to the channel. Wm. Grinnell has charge of the Breece and Wheeler mine. Some 18 men are employed. Harry Adams has been putting the Red Sea mine at Yankee Jim's in shape for work this summer. The White boys took out $4000 from their mine last week. The ore is rich in sulphurets and specimens, and is good milling ore also. But little mining is being done in either fork of the American. E. Kavanaugh is working a few men on Horse Shoe Bar, and Stewart and McGillivary are working at Little Pleasant Bar. They have not had a very successful season. Superintendent Chappellette is taking a much-needed rest. The opening of the Mayflower mine was accomplished through his energy and skill, and but few are aware of the vast amount of labor performed by him in bringing the great undertaking to a successful issue. The tunnel at the Gray Eagle is 6x7 feet in size, and is in a little over 130 feet. The rock is rather hard. A fine iron track has been laid. The compressors and other machinery for running the Burleigh drills are expected to arrive by the 5th of next month. T. G. Durning has been superseded in the superintendency. The boarding-house at the Eclipse is virtually finished. Some very rich ore has been taken from the east shaft. Hoisting works will be put up as soon as the machinery arrives. A mill will also be put up this winter. The Mayflower mine shows no decrease in its output. Prospect drifts are being run toward the east rim. No new developments have been made in the Orono (?) channel. As an instance of what a comparatively small amount of gravel will yield can be mentioned the result of washing the boulders taken from this mine. After being run out and all the loose gravel knocked off, the boulders were dumped and water was turned on; $1600 was cleaned up at one time and $800 at another. About the same number of men are employed right along. Twenty stamps are kept going night and day.

FOREST HILL.—Placer *Argus*, Sept. 28: Rumor is afloat that the Paragon mine at Bath has struck another rich streak. The Golden Fleece has struck rich gravel, and the owners are very proud of it. The Hogsback claim has shut down, owing to the tunnel being too high, and at present nothing is being done; but it is to be hoped it will soon begin again. The Hidden Treasure mine is again putting on hands, some of which were dropped a month ago, owing to enlarging the gangways.

IOWA HILL.—Cor. Placer *Herald*, Sept. 28: The Horman mill is running night and day crushing about 30 tons each 24 hours. It is reported here that the cement is very rich, running as high as $100 per ton. The Morning Star is putting in the wood necessary for winter use, and report says that the new management takes hold on the 20th. The Drummond mill has been running steadily for two weeks; whether the result is satisfactory or not, no one knows. The Pioneer Co. is, I am informed, engaged in pushing ahead its tunnel and prospecting. The Red Point is driving the main tunnel to the east, and hopes in a short time to be taking out pay grit. There is about the usual amount of annual work being done on the upper divide. The Washington Co. is prospecting its drift tunnel with all the speed possible.

Shasta.

MIDDLE CREEK.—Redding *Free Press*, Sept. 28: The Ottawa mill is running on full time. The Gem is running Sundays and all. The Iron Mountain Mining Co. is shipping a carload of iron ore below. C. Elliot of Flat Creek is opening up a good prospect, promising to be a bonanza. Andy Fife is running his mill on Flat Creek on good ore. The Walker mill, which was removed from the old works to the river, will be ready for operation on the first of the month. The Calumet G. M. Co. is only running one set of stamps on account of the scarcity of water, which will be overcome as soon as rain sets in. Reno and Musser have discovered a good prospect on Spring creek which promises to be a true-fissure vein, and an extension of the Last Chance. F. E. Whipple has bonded his mine to Steve Hill. Steve proposes to develop the same. We understand that he has outside capital interested. Anderson and Berg of the Middle Creek mine are developing their mine. They will ship a carload of quartz from Middle Creek next week. The Hartman mine is running two shifts, day and night, driving a tunnel to connect with the shaft, and some fine ore is being taken out. The intention of the company is to build a mill at Middle Creek and run a tramway to the river.

Sierra.

CHIPS.—*Mountain Messenger*, Sept. 28: A small run of ore from the Chips mine is being crushed at the Marguerite mill, and promises to prospect well. It was estimated that the rock ought to pay from $8 to $10 a ton. Mr. Locke, who is prospecting the mine, seems to be satisfied with the outlook.

MARGUERITE.—The work of freeing the Marguerite mine from water progresses satisfactorily. The new pumping machinery works like a charm so far, there being ample power for that purpose. At this writing the shaft is rapidly being freed from water, and it will not be long before the work of taking out ore will be begun. Mr. Morris, the superintendent, deserves a great deal of credit for the successful prosecution of this work.

GOLD BLUFF.—The work of taking out ore from the shaft at the Gold Bluff mine is progressing. The hoisting machinery is said to work smoothly and well, not requiring more than 15 or 20 inches of water from the Costa ditch to run it. Some very rich rock is being taken out, and the mill is running night and day.

THE Oxford Co. is repairing the road to the mine preparatory to getting in supplies in the near future.

Siskiyou.

GOLD.—Yreka *Journal*, Oct. 2: The Montezuma mine at Callahan's has been sold to a Chinese company in San Francisco for $50,000, with $10,000 down and $1000 per month for 40 months. This is the second largest sale of mines ever made in Siskiyou county, the Black Bear quartz mine at Salmon river being the first. These Chinese have wanted the mine for a long time, but the property has always been held at $60,000, and on getting the owner's lowest figure they accepted and are highly pleased with their bargain. The mine has produced a large amount of gold, and is not half exhausted. It is believed they will make the purchase-money all back in two years, and will then have a mine to last them for many years. It is currently reported that J. B. Eldridge has succeeded in disposing of the Steamboat mine on McAdams creek to a New York Co., and is daily expected from the East to begin opening this celebrated mine by a drain tunnel, and when opened it will prove to be one of the most extensive drift mines in Northern California. The hydraulic mines in Quartz Valley and Oro Fino are being fitted up for the expected wet winter. The Campbell mine, in particular, is about ready for water, and bids fair to beat its former record in the product of gold during the coming season. Capt. Wilbourne, backed by a San Francisco company, is now running a tunnel on the south side of Klamath river, in the Cottonwood district, opposite the Jillson & Co. claim. Jillson & Co. on the Klamath, near Cottonwood, have their hydraulic machinery and ditches in good working order for the winter, and expect to make a big success in piping a strip of good pay gravel ranging from 10 to 80 feet in width. The parties who bonded the old Empire ledge on Empire creek, Klamath river, for $10,000, have sunk a shaft and found a fine wide ledge, which prospects exceedingly well, and is destined to prove a bonanza. They will open it out in a good manner for taking out quartz, and expect by next spring to have a large amount of quartz on hand to start up the fine water-power mill near the ledge.

Tehama.

THE CHROME MINE.—Red Bluff *People's Cause*, Sept. 28: E. Hickman came in yesterday from the Chrome mine. He has just completed building five miles of road, leading to the mine from the county road near George Eaton's place. The mine is being rapidly developed. A platform is being built four miles from the mine, 50 feet long by 10 feet wide, to be used as a dump, where the mineral will be deposited after being taken from the mine. It will be hauled to the dump by light teams, and will there be loaded on to large wagons and hauled to town and shipped. Teamsters commenced hauling to the dump Thursday. Next week a number of large teams will be put on to haul into town. There are 300 tons of the mineral now in sight, and those who have examined the mine say it is inexhaustible. Mr. Knight, who is to superintend the shipping, is expected here from San Francisco, Saturday.

Trinity.

MACHINERY.—Trinity *Journal*, Sept. 28: Teams have been going through town this week loaded with machinery for the North Star mill, which will be erected on the North Star property in East Fork this fall. Times are lively around French Gulch now. Jack Conant has bought the Wheeler mine. Harrison Cox and son have struck a prospect near the Gulch which bids fair to develop into a good property.

CANYON CREEK QUARTZ.—Geo. Bailey was in from Canyon Creek this week and gives us the following items in regard to quartz discoveries in that section: Bailey & Flowers have two locations on the mountain between Canyon Creek and Stuart's Fork called Lookout and Mountain Echo. They have three parallel ledges on the locations. Two of the ledges have been tapped by two tunnels at a depth of 70 and 80 feet respectively, and both ledges show up better than on the surface. Ledge No. 1 is 40 inches wide and carries free gold and sulphurets. It is between well-defined walls, there being four inches of gouge matter on the hanging-wall—a good indication. Ledge No. 2 has been struck by a tunnel at a depth of 80 feet. Drifts have been run in two directions on the ledge, which is 3½ feet wide between the walls and prospects well—better than on the surface. He recently found the ledge on the surface 1200 feet distant from present location. The surface ledge when found is three feet wide and prospects very well. The boys have a good showing for a valuable property. There is plenty of timber for all mining and milling purposes on the claim and plenty of water to run a steam mill. On the 18th inst. Dedrick & Carlson found a ledge about half a mile west of Bailey & Flowers' locations which looks well. In panning up to it the dirt yielded 10 cents to the pan. They have a good, strong ledge about two feet wide with indications of its widening. They have traced it on the surface 2000 feet. Mr. E. M. Benjamin of Junction City is a partner in the location. Last Sunday, while out hunting, Gil. McCarthy found a ledge in a curious manner. He saw quartz clinging to the roots of an uprooted tree, and prospecting, found a ledge which prospects well. Grigsby's prospects look very well. He purposes putting up a small mill or an arastra this fall.

Tuolumne.

BONANZA.—Tuolumne *Independent*, Sept. 28: The Bonanza mine, which was thought would start up on the new shaft the first of the week, did not, as the engine proved incapable of doing the work. The entire works, including the shaft, have been covered with a commodious and substantial building, which gives the plant the appearance that its owners mean business. The shaft has been boxed in a strikingly mechanical manner, and a new self-dumping skip placed in position, and works like a charm. It is the only skip of the kind in this immediate vicinity. Work will be resumed on the new shaft as soon as the present engine can be replaced with a larger one, which will be as soon as possible.

TIOGA DISTRICT.—*Democrat*, Sept. 26: Indications point to a mining boom in Tioga next spring. A letter from the company in San Francisco to a gentleman in town states that as early as possible next year they intend to commence operations, and we have it from a reliable source that the Curtin brothers have been engaged to haul machinery to Tioga in the spring.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—Virginia *Chronicle*, Sept. 28: The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. Continue to stope ore of good quality from the point of connection between the northeast drift from the top of upraise No. 2 above the 1600 level. During the week 1088 tons and 1090 pounds of ore were shipped to the Morgan mill and 1695 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $27.55. Shipped during the week bullion valued at $11,000 to the Carson mint. Bullion valued at about $58,000 on hand.

CONFIDENCE AND CHALLENGE.—The 500 level joint Imperial north drift is out 980 feet from the Yellow Jacket shaft and continues in quartz and porphyry. The east crosscut from this drift is in 85 feet, showing clay in the face.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—The northwest drift to connect with the North Gould & Curry workings is out 21 feet. The ground is growing softer and more rapid progress will be made next week.

UTAH.—During the week extracted and milled 320 tons of ore showing an average assay value of $17.20 per ton. Bullion valued at $6172 shipped to Carson mint. Concentrates on hand valued at $7000.

OPHIR.—On the 1300 level the east crosscut from the shaft station, to connect with the top of the raise above the 1465 level east drift, is extended 148 feet, face continuing in porphyry showing some quartz.

HALE & NORCROSS.—West crosscut No. 1 on the 300 level is in hard vein porphyry. No. 2 is in hard quartz assaying from $7 to $10 per ton. New prospecting drifts are being advanced on the 1200 level.

MEXICAN.—On the 1465 level the north drift from west crosscut No. 1, 200 feet in from the lateral drift, is advanced 416 feet, continuing in porphyry and lines of quartz with some water.

BELCHER.—No. 1 east crosscut from the winze bottom on the 1200 level is out 30 feet, the face in low-grade quartz. The 200 level west crosscut continues in porphyry and clay.

IMPERIAL.—An east drift is being advanced from the winze bottom below the 300 level to connect with the Imperial shaft. The 300 level west crosscut is in low-grade quartz.

SIERRA NEVADA.—On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 182 feet. Formation, porphyry with some water.

OVERMAN.—The south drift from the winze bottom is out 45 feet in quartz, carrying fair grade ore. The incline raise is up 70 feet, showing quartz and porphyry in the top.

SEG. BELCHER.—The 1100 level east crosscut is in 270 feet, showing porphyry and low-grade quartz. The 1000 level south drift has connected with the raise above the 1100.

BEST & BELCHER.—On the 550 level, from the northwest drift, 148 feet in, east crosscut is advanced 18 feet. Formation, porphyry and clay with streaks of quartz.

SAVAGE.—Usual progress made in extending 300 and 400 level explorations without important change in formation. Extracting ore of good quality from the 500 level.

NEW YORK CON.—Still stripping ore in drifting north and south from the raise above the 800 level.

GOULD & CURRY.—On the 300 level, at a point 230 southwest from crosscut No. 1, an east drift is

advanced 30 feet. Formation, porphyry with streaks of quartz. On the 400 level west crosscut No. 1 is extended 344 feet. Formation, porphyry.

ALTA.—The mill is now dropping 15 stamps, crushing 45 tons of ore daily. Battery sample assays show a value of about $30 per ton.

CHOLLAR.—The winze below the 200 level continues in low-grade quartz. No important change in formation in advancing explorations at other points.

UNION CON.—On the 1465 level the north lateral drift is advanced 443 feet, from the south line, continuing in porphyry and clay.

SILVER HILL.—Usual progress made in 160 and 260 level explorations, with favorable indications for finding ore.

ALPHA.—The 382 level east crosscut continues in low-grade quartz. The shaft is down 50 feet below the 500 level.

POTOSI.—The 850 level south drift is still penetrating vein porphyry. No change in formation at other points.

YELLOW JACKET.—The 500 level west drift is out 670 feet. The daily ore shipments average 50 tons.

EAST SIERRA NEVADA.—The 520 level south drift is out 60 feet and continues in porphyry.

WARD COMBINATION SHAFT.—A west drift has been started from the 1050 level shaft station.

CROWN POINT.—The 700 level south drift is out 263 feet, the face in porphyry and quartz.

CALEDONIA.—West crosscut No. 2 is in 32 feet, the face showing porphyry.

JUSTICE.—Crushed 224 tons of ore assaying about $23.22 per ton.

EXCHEQUER.—No change in formation in 382 level explorations.

SCORPION.—The 520 level south drift continues in porphyry.

BALTIMORE.—Ore showing in 338 and 225 level explorations.

NORTH OCCIDENTAL.—Continue stoping ore from the 450 level.

ANDES.—The 350 level west drift continues in quartz.

Belmont District.

LAITY.—Belmont *Courier*, Sept. 28: Folsom's big team pulled out for Austin on Monday last, laden with silver ore from the Laity mine, in East Belmont. This ore will be worked at the Ledlie Reduction Works. The mine is looking better and better as the work of development is advanced. The ledge is now 8 feet in width, and is widening as the work of sinking progresses. The ore extracted is of a good quality. With continued work this property is making a good showing.

Columbus District.

REPORTED RICH STRIKE.—Virginia *Enterprise*, Oct. 1: Last week a rich strike of ore was reported in Hawthorne as having been made in the Columbia mine, which adjoins the famous Mount Diablo in Candelaria. Rumors made the strike 30 feet wide and the ore running from $50 to $200 a ton. Miners acquainted with that ground and the grand history of the Diablo property have been looking for years for an important strike there, and they were not at all surprised at the report, and readily accepted it as true. If so, its importance is incalculable to that section of the country, as it will go far toward demonstrating the permanency of Candelaria's mines.

Reese River District.

WORKING AT JACOB'S DUMP.—Reese River *Reveille*, Sept. 27: Richard Burrows, L. Adkins, Henry Welch and Fred Meyer have begun to run a tunnel from both sides of the Jacob mine dump, to get under and take out the quartz covered up, and send it to the concentrator. They are paid so much a ton, by the company, measured by the grade of the ore, and the two latter above mentioned have been collecting dump rock all summer, and have done fairly well.

ARIZONA.

CRUSHING ORE.—Prescott *Courier*, Sept. 26: Now that the weather in Black Canyon district is cooler, Geo. Zika and many more miners are getting their arastras in shape for crushing ore. Perry & Helm will do some arastraing on lower Agua Fria. Reports from Harqua-Hala district are satisfactory. The Bonanza mine is yielding rich ore. The ore body in the Hillside tunnel is three feet thick and very rich. Placer miners of Weaver and Antelope are making pretty good wages. The Roach & Mulvenon mine, Turkey creek district, will soon make another shipment. The Oro Bella Co. has let a contract for 800 cords of wood for their mill. They propose to add 10 more stamps this fall. Crowned King Co.'s mill is running. We believe that their ore is now roasted before being milled. The Ryland Co. have men sinking and drifting for more water. Supply is constant y increasing. Their ore body is said to be 12 feet thick. It is not high grade. The gold is free, so there is no necessity for assorting.

SAMPLING WORKS.—Mohave *Miner*, Sept. 28: The Arizona Sampling Works have, during the past week, shipped nine carloads of ore. During the past month something over 231 tons have been shipped, being about double the amount shipped for the corresponding month last year.

THE WORK of driving the lower tunnel of the Little Boy mine, Todd Basin, is progressing favorably considering the character of the ground. As there are something like 200 feet to be run, it will be some time before connection is made with the main shaft.

A BODY of high-grade gold ore has been encountered by the Rogers brothers in their claim at Blow-pipe Flat, near Chloride, and knowing ones report its extent and richness as exceeding anything heretofore found. This mine is opened sufficient to justify a small mill, and the owners are making arrangements to that end.

SUPT. MACKENZIE will in a few days resume work on the Cupel mine, Stockton Hill. The mine is at present full of water, and pumping it down to the 200-foot level, at which place good ore was left, will require ten or twelve days.

TIP TOP.—Cor. *Journal Miner*, Sept. 28: Work in the mines here is steadily going on, and while there have been no phenomenally rich strikes, nearly all are fairly prosperous. B. C. Williams, John Taylor and Harry Norton are working on the Seventy-Six, and while taking out considerable ore of excellent quality, are also doing good work in developing the mine. Theo. Wade, Harvey Helm and John Siss are working a lease on Ensign and Helm's Pin Pool mine, and are doing finely. A. Bauer & Co. are working at their lease on the old Tip Top. The extensive plant of the St. Louis-Yavapai Co. still remains silent, though why this is thus no one can say. The people here would be pleased to see it once more in operation and giving employment to its many hands.

COLORADO.

LEADVILLE.—*Herald Democrat*, Sept. 26: The Small Hopes people are still doing their regular work, shipments being about the same as when last noted. Most of the ore is hoisted from the Keren and Casey shafts, while the drifting from the 500-foot level of the McCormack shaft is still being driven ahead. At this point a large body of iron sulphides was encountered, which is opening out and the grade steadily improving. Sinking on the Chadbourne shaft has been resumed, and it is going down at the rate of 4 feet per day, a set being placed in position each 24 hours. The shaft has now attained a depth of 535 feet, and, with the connection made with the original shaft, the workings are thoroughly ventilated. Shipments remain about the same. In the south drift of the R. A. M. another large and valuable body of ore has been encountered during the past week, shipments from which will be considerably delayed on account of the air being so bad in that portion of the mine that but two or three men can work there at present. At the breast of a drift about 160 feet in length from the 235 level, the lessees on Pittsburg No. 9 have encountered a good body of lead carbonate ore, as well as a large body of argentiferous iron, from which they are shipping right along, and working the mine to a great profit. Mr. Holden has again started up on No. 1, Robert E. Lee, the cage shaft, and is breaking iron preparatory to shipping on a large contract which he has made with one of the Leadville smelters.

DAKOTA.

ACTIVITY AT GALENA.—Deadwood *Pioneer*, Sept. 26: James Conzette and Sheridan McBratney report great mining activity at Galena. Work is in progress on a number of claims. Lessee Havens has a force of 14 employed at the Richmond-Sitting Bull and is constantly shipping ore. Huyett & Fargo are operating the Cora, while Conzette is developing the Alexander and other claims in which himself and Seth Bullock are interested. Besides these, a number of other properties are receiving attention. A scarcity of miners alone prevents more extensive operations. Everybody wanting work can get it. Conzette has had difficulty in getting additional forces, and has therefore been compelled to, in a measure at least, curtail operations. Many good mines are being developed and the camp is prospering.

THE LIDA GROUP.—The *Pioneer* mentioned a few days ago that a body of very good ore had been struck on the Lida group of mines, Elk creek. Enough ore, some 15 to 20 tons, for a test run has been taken out. This will be milled at the Uncle Sam. The mine has been closed down for the season, owners, however, intending to inaugurate extensive developments early next spring.

IDAHO.

ANTELOPE DISTRICT.—Cor. Wood River *Times*, Sept. 21: The long suspension of work on the most noted mines at Era and in that vicinity has caused the virtual abandonment of many excellent prospects along the Dry Fork of Antelope, but now that the Hub company has commenced operations on a large scale, and the running of the Bannock mill at Era is assured, attention is again directed to this promising district, and very few claims there will be left unrepresented. The chief point of interest at present, however, is the group of locations known as the Lead belt, and lying on the waters of the main Antelope about eight or ten miles from Era. Here a few resolute and energetic prospectors made locations in the spring and summer of 1886, and ever since that time they have, in the face of adverse circumstances, kept constantly at work, and the amount of development work that has been done here by poor men, working alone and unaided by outside resources, is indeed surprising. In crossing the divide between the valley of Dry Fork and Antelope creek we first come to the claims of W. H. Brown—the Bayhorse and Redbird. He has driven 200 feet of tunnel, and has quite a good showing of ore. Next to Mr. Brown's, on the west, lie the claims of John Buchan, one of the first locators of the district. I am credibly informed he made a shipment of ore which netted $119 per ton. Next in order comes the Cliff No. 1, owned by John Emory, Wm. Wiley and A. A. Bonham. Here we find a shaft 45 feet deep, 250 feet of tunnels, and a winze 35 feet deep, over half the work being done on and along the ledge. They have about 150 tons of ore on the dump which carefully selected sample assays show to be worth about $45 per ton. The next adjoining claim is the Carbonate, owned by Dr. McKay, Mr. Brown of Hailey, and Samuel Sheridan. Here a pocket of ore was found, from which several shipments were made, of sand carbonates, which netted the owners $113 per ton. The Tom Thumb, near by the Carbonate, owned by McKay, Cederholm & Brown, is a magnificent prospect. The Lola lode, owned by M. B. O'Dell of Era, is justly regarded as a splendid property. After driving over 250 feet of tunnels, in what many call wild-goose chasing, Mr. O'Dell has at last found ore, samples of which run as high as 210 ounces per ton.

DICKENS-CUSTER.—Cor. Ketchum *Keystone*, Sept. 28: The Dickens-Custer Co. has resumed operations in earnest. For nine years past the General Custer mill has been slowly grinding away, until its output is something over $7,000,000; with the mines now showing better than ever, with new strikes being made daily, and with cheaper transportation, one cannot help but think that Custer and the Custer-Dickens Co. are commencing on a new era that will redound to their benefit, and the existence of the latter will therefore prove of incalculable benefit to Custer and Alturas counties in particular, and the new State of Idaho in general. G. B. Baldwin and Mose Stover are in from Seafoam and report the season's development as generally satisfactory. The Lucky Boy force is already increased to 50 men, and increasing daily. The Dickens is working 10 or 12 men, the Washington about 10, the Fourth of July about 50, with 15 men on Estes, and several others scattered on different properties. The McGowan Brothers and Banjo Bill have opened a fine property at the head of Five-mile creek and are preparing to work all winter. Parties who have seen it report eight inches of 180-oz. ore for 30 feet long, and growing stronger in breast of drift. Pete Johnson's crew have finished framing the timbers for the mill and are now on the hill erecting the same. If the weather permits, this mill will be dropping stamps yet this fall.

ELECTRICITY IN MINING.—Montana *Mining Review*, Sept. 28. A new departure in mining in the Northwest is contemplated by some of the Cœur d'Alene mine operatives, and it is said that electricity will shortly be the most important factor in the working of many hitherto unprofitable claims in the north side districts bordering on Pritchard creek, a company with sufficient capital having been organized for the purpose of securing an electric plant, which will furnish power to force water up to any desired hight. By this method the banks of pay gravel in the hills high above and surrounding Pritchard creek can be made to yield enormously. The preliminary work of this great enterprise is expected to begin during this fall, and the progress of the undertaking through its various stages will be watched with interest by the mining men of Montana, in many sections of which large areas of placer ground exist that could be mined at an immense profit by such a method as the one referred to.

GOLD BULLION SHIPMENTS.—*Statesman*, Sept. 29: A visit to the United States Assay Office yesterday resulted in the gathering of the following items: The shipments of gold bullion from the local office to the mint in Philadelphia for the months of July, August and September were as follows: July, $39,531.33; August, $48,725.18; September, $35,148.63. While at the Assay Office, the reporter was shown a gold brick from the Kaintuck mine in Lemhi county. The brick, as seen, was in the rather crude condition in which bricks usually leave the melting process at the mine. Its gross weight was 10¼ pounds, with an approximate value of $4100.

MONARCH.—Idaho *World*, Sept. 24: Wm. Oliver, Wm. Kearney and Thos. Barry, Jr., had four tons of ore crushed recently in the Forest King mill from their location—the Monarch—on Summit flat. The ore turned out about $40 per ton, which is over average for gold ore. The ore in the bottom of the shaft is a higher grade than what they had crushed. The ore got poorer as they stoped from the bottom of the shaft up, which is not a bad showing for a mine, as it proves that it improves with depth. With a little more development the Monarch, from present indications, will prove to be a valuable mine.

TEN TONS of Lucky Baldwin ore were crushed in Morrell's mill and Capt. Smart brought over the bullion yesterday. The ore was the second grade and milled between $7 and $8 per ton. The Lucky Baldwin vein is over three feet wide.

LOWER CALIFORNIA.

A MAGNIFICENT SUCCESS.—Alamo *Nugget*, Sept. 20: The International Co.'s new mill started up on the 12th inst. and has been continuously at work since. Every part of the machinery worked to perfection from the beginning and not a halt was necessary to rearrange anything about the mill, as is almost universally the case with all new machinery. But few persons in camp had ever seen a Huntington mill and there were many grave doubts expressed as to its success; but to-day there is not a a doubting Thomas in the community, all joining a general rejoicing over this most important success of the leading company of the camp. In the neighborhood of 15 tons of ore have been crushed each 24 hours, the ore coming from the Princesa, Ulises, Telemaco Cocinero mines, all of which belong to the International Co. The first general cleanup will be made to-morrow, when the results will be known. Amalgam has been taken from the mill and off the plates each day, and will be retorted after the general cleanup. Sufficient amalgam has been taken out to show that the ore is paying very handsomely. The week's run not only demonstrates the success of the mill, but that the company has plenty of pay ore to supply the mill. The ore was not carefully assorted for a special run, but was gathered from the dumps of the several mines, from their accumulations of ore in doing possession work and starting shafts for development purposes. With the present showing the mill will easily produce sufficient revenue to meet the current expenses of the development of the company's mines. In a short time the mines will produce ore enough for one or more addi ional mills. The company and builder are to be congratulated on the result. The Huntington mill cost about one-fourth that of a stamp-mill of the same capacity, and the company's mill proving so decided a success, many others are sure to be built in the camp.

THE EL PASO MILL.—Most of the machinery and timbers of the El Paso quartz-mill are on the ground and the work of grading for the mill-site nearly completed. The preparation of the foundation of the mill, like the mill and all its appurtenances, is of the most substantial and solid kind, and when finished it will be the most complete mill on the peninsula. It reflects credit on its owners and builders, and will add greatly to the permanent improvements of the camp. Work is being steadily pushed on this company's mines developing ore for the mill. They are not sparing either labor or money to make their enterprise a g and success, of which there can be no doubt. It is a matter of regret that Alamo has not half a dozen such enterprising companies to develop her numerous great mines.

MONTANA.

AROUND ARGENTA.—Cor. Montana *Mining Review*, Sept. 28: It is wonderful the new life and activity this camp has taken on since the P. J. Kelly Mining Co. commenced operations here. The Co. now employ 50 men, distributing about $3000 a month in wages alone, and as soon as the Co. start up their smelter, which will be in about ten days, it will employ 125 men. Great praise is due the managers of this enterprise for the push and business-like manner in which the smelter has been rushed on to completion. The P. J. Kelly Co. is here to stay. They have a large property and every day's work in developing the mines gives additional assurance of success. The ore is now running high grade, assaying from $100 to $200 a ton. Last Saturday while drifting in the Anaconda mine, property of this company, a large body of high-grade ore was encountered, running as high as 100 ounces in silver. The ore is a carbonate in formation. The daily production of the mines of this company is about $6000.

ARGENTA DISTRICT.—Butte *Miner*, Sept. 25: Alex. R. Allen, general manager of the P. H. Kelly Placer and Quartz Mining and Reduction Co., reported developments and improvements on the company's ground as progressing rapidly and satisfactorily. The placer claims owned by the company are located at Argenta, about 12 miles from Dillon, and cover about 700 acres of ground. On the quartz claim, Mr. Allen stated, over 1800 feet of open work has been done, the greatest depth as yet attained being 145 feet. A 60-ton smelter is being erected at the mine. The plant will be enlarged by the addition of two more stacks of the same capacity, which will be in operation by early spring. With present amount of development a five-years' supply of over average ore is exposed. The ore runs from 30 to 60 per cent lead, 10 to 40 ounces in silver, and from $4 to $10 gold per ton.

FLOAT.—Recent developments in the Keystone, Oro Fino district, have been so satisfactory that the stock is now being held at 25 cents a share. For the week ending September 15th, Butte shipments of matte amounted to 1,208,944 pounds. This is exclusive of the Anaconda product, amount of which is not known. The Germania is being worked under a lease by McAuliff & Co., who are now sinking and taking out ore which goes $2000 a ton. The shifts of four men are at work in the shaft, and rapid progress is being made. The lessees anticipate a big cleanup on their lease.

NEW MEXICO.

PACIFIC MILL.—Silver City *Enterprise*, Sept. 27: Between 50 and 60 tons of ore is being received at the Pacific mill daily, which will keep the 20 stamps moving most of the time. Eight extra teams were put on hauling ores this week. Nick Rascom has taken a bond and lease on the Pine Dell extension, Juniper mining district. Nick thinks he has a bonanza, and expects to strike the Peerless lead from which ore valued at from $8 to $9 per pound has been taken.

BULLION.—Between $23,000 and $24,000 worth of silver bullion was shipped last week by the Minbres Co. of Georgetown. As long as such shipments are made, Grant county will continue to be the great bullion-producer of the Southwest. C. H. Brenean and Judge Barber spent a portion of the past week here examining the Night Bird property at Pinos Altos. They were much pleased with the property, and will doubtless soon organize a strong company to take hold of it.

AZTEC.—*Southwest Sentinel*, Sept. 24: The Aztec company stockholders are to hold a meeting in St. Louis on the 5th of October, to consider the propriety of mortgaging the company's property for $75,000. What will become of the stockholders when the mortgage is foreclosed—that is, the stockholders who are not on the inside?

THE Mimbres Con. Mining Company of Georgetown shipped 26,624 ozs. fine silver bullion on Friday last; the valuation placed upon it by the company at the time of shipping is $21,000 — the real value, however, is nearly $25,000. This undervaluation saves a little on the cost of transportation.

UTAH.

REVIEW.—Salt Lake *Tribune*, Sept. 28: The week has been a dull one in the local mining world. The handling of ores and bullion has, however, been fair, and the prospects for the fall season are very good. The Hanauer smelter has started up in full blast again. The shipments of the minerals out from this city for the week ending Saturday, Sept. 21st, inclusive, were 2,671,328 lbs. The receipts in this city for the week ending Sept. 25th, inclusive, were to the total value of $111,125.75, of which $51,326.46 was in bullion and $60,799.20 in ore. For the previous week the receipts were to the value of $52,921.26 in bullion and $52,604.58 in ore, a total of $105,526.26. Fine bar receipts in this city for the week were to the value of $19,620; bullion and base bullion, $9656.46. The product of the Hanauer smelter for the week was $15,900 in bullion. The ore receipts in this city for the week were to the value of $25,549.29 by Wells, Fargo & Co., and $35,250 by McCornick & Co. The product of the Ontario for the week was from ore sales, $9719.46; bullion, 17,706 fine ounces; an approximate total of 27,425.46. Fifteen shares of Ontario stock sold in New York, Sept. 18th, at $36, and 19th at $35. The Daly output for the week was from ore sales, $123.60.

PARK CITY.—Cor. Salt Lake *Herald*, Sept. 29: Bullion shipments: Sept. 25th, 15 bars Ontario, 7968 ozs; Sept. 26th, 15 bars Ontario, 8023 ozs; Sept. 27th, 15 bars Daly, 16,283 ozs. Received at Park City sampler for week ending Sept. 27th: 496,200 lbs. of Ontario ore; 338,500 lbs. of Daly ore; 48,950 lbs. of Woodside ore; 87,600 lbs. Mayflower ore; 29,500 lbs. of Apex ore; 9210 lbs. of Crescent jig ore; 28,500 lbs of Union concentrates. The Crescent Co. shipped this week 200,000 lbs. of concentrates and 50,000 lbs. of first-class ore. The Ontario Eastern drain tunnel is in a distance of 2500 feet and the Alliance tunnel is in 1300 feet. Active operations will be commenced at the Glencoe on the 1st prox. and it will not be long before this very promising property will be numbered among the heavy shippers. There is sufficient ore on the dump and in sight to continue shipments for some time. The new hoisting works at the Woodside are completed and under cover. The boiler is in position, and the new engine which arrived to-day will be taken at once to the mine. Another good strike was made at the Comstock this week, the ledge having been again struck in the face of the tunnel, and looking better and richer than any heretofore encountered. The tunnel will be driven about 65 feet farther to make connection with the shaft, when better facilities will be afforded for developing this very promising property.

WASHINGTON TERRITORY.

COAL.—Ellensburg *Capital*, Sept. 28: The coal mines of this county are now producing 1600 tons per day. This is the largest output of any coal district in Washington. Two veins of coal, one five and the other eight feet wide, have been discovered within 12 miles of Ellensburg. These are the largest veins ever discovered in the Northwest.

MECHANICAL PROGRESS.

How to Properly Test Cast Iron.

The following article by J. B. Johnson, director of the testing laboratory at Washington University at St. Louis, we find in the *American Manufacturer*, with a fully illustrated description of the device for properly testing cast iron:

Cast iron is one of the most useful of metals, but one of the most variable in its qualities. Its strength in simple tension varies from 15,000 to 30,000 pounds per square inch, or 100 per cent, while its toughness, or ability to resist a shock or blow, varies by over 600 per cent.

For ordinary foundry purposes cast iron should be soft, to allow easy working under tools; and tough, to resist the effects of shock. It is probable that cast iron breaks nine times from some kind of jar or blow to once from a static load, and hence its ability to resist a shock is many times as important as its ability to resist a dead load.

Now, when cast iron is tested for strength, whether in tension or in cross-breaking, only its ability to resist a quiescent load is determined. Such a test gives no information as to the strength of the iron to resist a shock. It often happens that the strongest iron is the most brittle, or the least able to resist a jar or blow.

Again, when cast iron is tested by the impact test, or by letting a body fall upon it, every blow causes a permanent set or distortion, and so permanently weakens the specimen for resisting other blows, so that when the specimen breaks the test only shows how much strength was left in the body after the previous blows had been given, and not how much was in the material in the first place.

There is, therefore, but one way in which to determine the original resistance of the body to shocks, and that is by testing to rupture with a gradually applied load, either in tension or in cross-breaking, and observing its distortion under this breaking load. This distortion is a simple stretch in case of a tension test, and the deflection in the middle in case of a cross-breaking test. Both methods are competent to determine the absolute resistance of the body to resist a shock.

The resistance to shock depends on both the strength and on the amount of distortion, or "give," the body will take before rupture. A body which will not bend or distort under a load is said to be brittle, and brittleness is weakness when a shock is to be resisted. When two rigid bodies come together at an appreciable velocity, the force of impact is less as the distortion or spring of the materials is greater. If the bodies were absolutely rigid—that is, if they would not distort at all, the force of impact would be infinite so long as the weight and velocity of the bodies were appreciable.

That quality of a material which enables it to resist a shock or blow is called its resilience, or spring. It is not strength, which is measured in pounds, not distortion, which may be measured in inches, but it is the product of both strength and distortion, and is therefore measured in inch-pounds. That is to say, resilience, like work, can only be measured by a unit which includes both distance and force, as inch-pounds or foot-pounds.

A body weighing ten pounds and falling ten feet, or 120 inches, has stored in it ten times 120 or 1200 inch-pounds of energy, or it is then able to do 1200 inch-pounds of work on some other body. If this body should now strike a bar of cast iron, for instance, the iron must be able to develop more than 1200 inch-pounds of resilience, or spring, in order to absorb this energy without breaking.

Now, the resilience of a bar of cast iron in cross-breaking is one-half the product of the breaking load into the final deflection. That is, the load increases from zero to the breaking limit while the deflection is being caused, and the total work done on the bar is the mean or average load, multiplied by the total deflection.

If the load be measured in pounds and the deflection in inches, then the half product is given in inch-pounds.

If the bar be supported at its ends, and broken by a load in the middle, then the whole bar contributes to the deflection, and hence the resilience or resistance to shock of the whole bar is obtained. If we now divide the half product of the breaking load into the final deflection by the weight of the bar in pounds, the result will be the resilience of the material in inch-pounds per pound of iron.

This result is independent of the particular dimensions of the bar, but does depend on its form. For plain rectangular bars, of uniform size from end to end, the result should be the same when the same iron is used. A different result would be obtained for a round bar, but all rectangular bars of the same iron should give the same result, whether flat, square, or broken across in the direction of the greater dimensions.

By this rule no attention need be paid to the dimensions. Take any plain rectangular bar, of any length, and of any cross-section, so long as it is uniform from end to end. Break it by a load on the middle, and measure the breaking load in pounds, and also the deflection in inches. Take half their product and divide by the weight of the bar in pounds. The result will vary from 10 for the most brittle and worthless iron to 70 for the strongest and toughest. A result of 25 will correspond to the lower grades of ordinary foundry product, such as is used in water and gas pipes, while a result of 40 to 50 will correspond to the better grades of machine castings. Stove irons should give a result from 50 to 70.

With this rule, any foundryman could determine the quality of his own mixtures, if he only had a convenient machine for making cross-breaking tests, which would give both the breaking load and the deflection.

Such a device has been designed by the writer of the above, made to operate as an attachment to an ordinary pair of platform scales. It has been so designed because the weighing part of a testing machine is the principal source of expense.

TWISTED CAST IRON.—Rathbone, Sard & Co. of Albany, N. Y., recently produced some specimens of cast iron which manifest unusual properties. The specimens, as described by a New York paper, are pieces of metal about one inch in width, one-eighth inch in thickness, and some 15 or 18 inches in length. Some of these strips have been twisted so as to form spirals. Others have been wrapped upon coils. That cast iron can be made very tough and a certain amount of elasticity imparted to it is known to many of our readers, but it is unusual, to say the least, to find in stove foundries any metal which will bear such tests as here indicated. The twisting and bending is done hot. The company assures us that there is nothing in the metal in these specimens but a judicious admixture of good irons and the absence of old scrap. They make the assertion, further, that it represents their daily melt and that all the Acorn stoves which are being produced have their plates of the same metal that shows these peculiar tests of toughness. All this is undoubtedly of special interest to the trade. It is not to be understood that because the metal will bear a torsional strain of the kind indicated in the engravings it is still unbreakable, for, of course, there is a limit to its elasticity, but that it is stronger than many specimens of cast iron to be found in stove plates it is scarcely necessary to assert after an inspection of the samples which have been submitted.

A NEW COKE-MAKING PROCESS.—Mr. Kingsford of Brighton, England, has just invented a process for making coke while steam is being generated, which has been employed with satisfactory results at various chemical and other manufactories. Two boilers have been made upon this principle to test the working of the process. These boilers are constructed upon what is known as the elephant system, except that they have three bottom tubes similar to those of the Cornish boiler—that is, with an internal flue running the entire length, and provided with suitable openings for the admission of the gases into them. The ovens have openings in convenient positions, and through these the gases pass into the internal flues and are delivered into the lower of two chambers. They return under the lower shells to the opposite end of the boiler, and are thus delivered into the upper chamber, finally passing away into the chimney or uptake. These two boilers generate from 5000 pounds to 6000 pounds of steam per hour. The coal used for the purpose is small and suitable for coke-making. It can be cheaply purchased. It is stated that the product of this system—the coke—is worth as much as, if not more than, the coal at first employed. Thus the adoption of the principle is declared to secure the production of steam absolutely free of cost.

THE LATEST IN HORSESHOE MANUFACTURE.—The rolling-mill of the Chicago Horseshoe Co. located at East Chicago, Ind., has a 12 inch train of rolls, driven by an engine built by the Taylor Manufacturing Company of Chambersburg, Pa. The rolls are so arranged that the horseshoe bar is led from the final pass between two large vertical rolls. In the periphery of the upper roll are arranged at proper distances a series of teeth and projecting ridges which punch the bar for nail holes and also crease it. The bar then passes directly to the horseshoe machine to be shaped. On entering the machine the bar is pressed into the requisite curved form by a number of direct acting plungers operated by cams or eccentrics, and at the same time the heels are formed by another set of plungers. Saws placed below cut the shoes apart. This machine is so constructed that more shapers and saws can be added to operate on longer bars whenever an enlargement is deemed necessary, thus greatly adding to the capacity of the machine. The equipment of the works also includes a number of separate punching and shaping machines for turning out the Goodenough shoe which the company propose to manufacture. The works will probably be started within a few days.

DEFECTS IN THE WIRE NAIL.—The wire nail has now been long enough in the market to demonstrate some of its defects. It is found by experience that the head, which is flat, rusts off after about two years' exposure, thus rendering it entirely unfit for shingling or any other work which requires that the nail shall be exposed to the weather. This serious fault, together with the inferior holding power of the wire nail as compared with the cut nail, which has been demonstrated by the Government tests, make it an object of suspicion, and will materially limit the list of good traits that the manufacturers claim for it.—*Ohio Valley Manufacturer.*

SCIENTIFIC PROGRESS.

Is the Formation of Steam a Physical or Chemical Change?

Noah Webster, in his "Unabridged," defines "steam" as being "The elastic, aeriform fluid into which water is converted, when heated to the boiling point; water in the gaseous state." And that is about as good and concise a definition of the article in question as one could find in a day's search.

But the particular point is as to whether the steam is only water vaporized, or whether it has been converted into something else by the action of heat. In other words, is the formation of steam caused by a physical change or by a chemical one in the water? By a physical change is meant one which does not affect the molecules of the body acted upon, and does not take away or add any properties of which it may have been possessed.

A chemical change, on the other hand, is one in which the molecules are pulled apart and resolved into their original elements, or combined with something else so as to form a new compound.

A familiar example, as given in elementary books on chemistry, of a physical change consists in the pounding of a lump of sugar into a fine powder. Its form is changed, but it still remains sugar. Pour some sulphuric acid on the same sugar, and in a very short time it has been converted into carbon in consequence of the affinity which the acid always manifests for moisture—each molecule of the sugar having in its composition 22 atoms of hydrogen and 11 of oxygen. A chemical change has been effected.

Now I have tried hard to settle in my own mind as to whether the formation of steam is a chemical or physical change in the water. According to the rules, so far as they go, it is only a physical change both as to the pounding of sugar into powder and the vaporization of water by the application of heat. But suppose you continue the pounding of the sugar until sufficient warmth is evolved to cause combustion, and the heating of the water is continued until the molecules of steam are separated into their original atoms of hydrogen and oxygen.

What do you call it then? Therefore I ask if there is not good reason for advancing the idea that the formation of steam is simply a preliminary stage in a chemical change of the water?—*Power Steam.*

Loss of Light Through Windows.

Some interesting experiments have been undertaken by Herr Herzberg, with the co-operation of Herr G. Schulze, chief engineer of the Berlin works of Messrs. Frederick Siemens & Co., for the purpose of ascertaining the loss of light in passing through window glass of various kinds in general use. The experiments were conducted with a Bunsen photometer, in which two Argand gas-burners of equal illuminating power were placed at the two ends of the graduated bar. After equality of illumination of the screen had been established, a plate of the glass to be tested was interposed between one of the end lights and the screen, and the extent of the displacement of the latter thus necessitated for the re-establishment of equality of illumination on both sides gave the measure of the opacity of the glass. A simple translucent, but not transparent, glass showed a loss of 27 per cent of light. Cathedral glass, such as is used in stained-glass work as a basis, being clear but with a slight ground tint, showed a loss of 12⅝ per cent. Plain cathedral glass, with a white tint, also showed a loss of 12⅝ per cent. Plain white Rhenish "double glass" gave a loss of 10 per cent. Plain thin mirror glass obstructed 10 per cent of light. The two last, together with an interval of six centimeters between them, showed a loss of 21 per cent. Cathedral and Rhenish "double glass," together with the same interval, showed a loss of 23 per cent. A ground glass with cut stars, together with a white background, such as is found in house fan lights, obstructed 60 per cent of light. A new, clean piece of ground glass without stars, together with the dusty white glass background, as in the preceding experiment, showed a loss of 40 per cent.

THE CREATION OR DIFFUSION OF FOGS BY CONCUSSION.—A novel proposal for the dispersion of fogs has been made by a Swiss artillery officer, who has placed upon record his opinion that a phenomenon of this kind recently occurring under his observation was due to a discharge of some pieces of ordnance. This statement has been circulated in France and has elicited communications upon the atmospheric effects of artillery fire, leading to quite a different conclusion. It has been stated, for instance, that during the siege of Belfort, in the Franco-Prussian war, where an average of 1000 discharges of cannon per hour was registered for many days in succession, firing was frequently suspended on both sides, owing to the dense fogs which settled down upon the field of action. This observation would give ground for the supposition that concussions of the air near the surface of the soil, by interfering with the circulation of air bring about that congested condition of the atmosphere which is a necessary condition for the production of fogs. This conclusion leads further to the idea that not only the aggregation of houses in towns, preventing the passage of light breezes, determines the production of fogs in such localities, but also that the concussion of air due to the shocks of town traffic may operate in the same way. Further observations are desirable in regard to this matter; but now that the nature and causes of town fogs are so carefully studied with a view to their prevention and cure, it is desirable that every contribution to the elucidation of the subject, however apparently insignificant, should receive its due meed of attention, because if not conclusive in itself, it may possibly contain the hint of something that it would be misleading to overlook.

PHOTOGRAPHS BY TELEGRAM.—If some newspaper correspondent is not gulling the people by writing from New York to the Boston *Herald*, a chemist, electrical expert and inventor, living in New York, has originated a method of taking pictures of passing events by instantaneous photography, and then transmitting them by telegraph, to be reproduced in the columns of a distant journal within six or eight hours after the event occurs. The machine runs by clockwork and electricity. The newspaper reporter thus becomes his own photographer, telegrapher and artist. A patent was taken out some years ago through the patent office connected with this journal, by a citizen of San Francisco, for a device by which an entire newspaper page, with any number of engravings, could be transmitted by telegraph in a few minutes. There seems to be no limit to the wonderful power of electricity as connected with the telegraph. The latest effort in this direction is referred to in *Popular Science News*, as follows: M. Leon Esquine, a Mexican, it is stated, has perfected a marvelous invention in electricity and photography. By speaking in a photophone transmitter, which consists of a highly polished diaphragm reflecting a ray of light, this ray of light is set into vibrations, and a photograph is made of it on a traveling band of sensitized paper. Now comes the wonderful part. If the image of this photographic tracing is projected by means of an electric arc or oxynydrogen light upon a selenium receiver, the original speech is then heard. It is evident that there is no limit to the development of this peculiar combination of methods. This is very important, if true.

ELECTRICITY IN POWDER-MILLS.—The German technical journals have recently published some instructions as to the precautions which ought to be observed in powder-mills to prevent explosions attributable to electricity. In a large powder-mill in Germany an explosion lately occurred in the press-room. A workman engaged in pressing powder into cakes between sheets of ebonite, left his work during a thunder-storm. When the storm was over he loosened the press, and, on putting out his hand to remove the powder, a spark four inches long went through his body, igniting the powder and killing the man. The employment of insulating substances, such as gutta percha, ebonite, etc., is therefore considered as liable to lead to accidents. In one of the principal powder-mills of Germany the sulphur crushing machines are all put to earth, and since this precaution has been taken there has been no trouble from the mysterious explosions which had previously proven so troublesome.

HOW MOUNTAINS ARE MEASURED.—The hights of mountains are now ascertained by two methods—trigonometry and the barometer. The latter method, of late years, has supplanted the former, except where the mountains are inaccessible. Barometrical measurement was discovered by Pascal, the mathematician, in his experiments. He found that the hight of the mercury in the tube varied at different hights above the level of the sea, because of the difference in the pressure of the atmosphere. He judged from this that the indication of the barometer might be used to ascertain the hights of different elevations. The perfection now obtained in the construction of barometers, and skill applied to their use in observations, renders it possible to have elevations calculated with the greatest accuracy. These observations are conducted with much carefulness, two good barometers being generally used, the one at the lower and the other at the upper point of observation.

NOT AMERICAN BUTTERFLIES.—Edward Everett Hale says: "I was brought up to consider Charles I a saint and a martyr, and Oliver Cromwell a fanatic and a murderer, simply because the people who wrote the books which I read as a child, chose to think so, and lived in England. Why, as lately as when Agassiz first came to this country, he went into a Cambridge printing office, where they were printing a book of natural history. They showed him the sheets with some pride, and Agassiz said: 'Yes, I see. An American school-book with pictures of three butterflies, and not one of the butterflies was ever in America! That is the way to bring up children in a colony.'"—*Chicago Journal.*

DELTA METAL, which is prepared for market in ingots, plates, sheets, rods, wire, etc., is properly an alloy—an improved quality of brass—as hard, durable, and strong as mild steel, and of a beautiful golden color. When melted it produces sound castings of fine grain; can be forged and rolled hot and cold, and takes a very high polish. It is being largely used in London and elsewhere for all kinds of machinery, and for house, door, and other fittings.

GOOD HEALTH.

Stimulants and the Voice.

Tobacco, alcohol and fiery condiments of all kinds, says the *Contemporary Review*, are best avoided by those who have to speak much, or at least they should be used in strict moderation. Like tippling, the effect of cigarette-smoking is cumulative, and the slight but constant absorption of tobacco juice and smoke make the practice far more noxious in the long run than any other form of smoking. Our forefathers, who used regularly to end their evenings under the table, seemed to have suffered little from the well-known effects of alcohol on the nerves, while the modern tippler, who is never intoxicated, is a being whose whole nervous system may be said to be in a state of chronic inflammation. In like manner cigarette-smokers (those at least who inhale the smoke, and do not merely puff it "from the lips outward," Carlyle would say) are often in a state of chronic narcotic poisoning.

The old jest about the slowness of the poison may seem applicable here; but though the process may be slow, there can be little doubt that it is sure. Even if it does not kill the body, it too often kills or greatly impairs the victim's working efficiency or usefulness in life. The local effects of cigarettes in the mouth must also be taken into account by those whose work lies in the direction of public speech. The white spots on the tongue and inside of the cheeks known as "smokers' patches" are believed by some doctors with special experience to be more common in devotees of the cigarettes than in other smokers; this unhealthy condition of the mouth may not only make speaking troublesome, or even painful, but it is now proved to be a predisposing cause of cancer.

All fiery or pungent foods, condiments or drinks tend to cause congestion of the throat, and if this condition becomes chronic, it may lead to impairment, if not complete loss, of voice. The supposed miraculous virtues of the mysterious possets and draughts on which some orators pin their faith exist mainly in the imagination of those who use them; at best they do nothing more than lubricate the joints of the vocal machine so as to make it work more smoothly.

THE VALUE OF SINGING.—A recent writer in the Boston *Herald* advocates the practice of teaching singing as a means of preventing consumption. As Dr. Busey aptly says, if an hour a day were devoted to it in our public schools, there would not be the sad spectacle of the drooping, withered, hollow-chested, round-shouldered children. Vocal music is gymnastic exercise of the lungs by development of the lung tissue itself. The lungs in improved breeds of cattle, which naturally take little exercise and are housed much of the time, are considerably reduced in size when compared with those animals running at liberty. And so it is with the human race who lead inactive lives caused by civilization. Consumption generally begins at the tops of the lungs, because these parts are more inactive, and because the bronchial tubes are so arranged that they carry the inspired air with greater facility to the bases than to the tops. During inactivity a person will ordinarily breathe about 480 inches of air per minute. If he will walk at the rate of six miles an hour, he will breathe 3260 cubic inches. In singing this increases more than in walking, as to sing will require all the capacity of the lungs. Besides vocal-music exercise, there are wind instruments which all with hollow chests can use with infinite advantage. Give a young person a cornet, a clarionet or some such instrument, and by the time he has learned to play upon the same his deformity will have entirely disappeared.

SAVED BY HER STOCKINGS.—Her thick woolen stockings saved the life of Mrs. Burton of Middlebury, Pa. She was bitten by a rattlesnake, but the stockings absorbed the venom. The spot turned bright green. The writer of this paragraph, like all civilized specimens of the human race, once wore petticoats. While thus clad he was taken from his feet by a mad hog and received a violent shaking as if by a dog. When rescued, the skin had been broken by the action of the hog's teeth and blood was flowing from the wound. The virus was no doubt kept from the system by the garment in which he was clad, otherwise he might never have lived over 70 years since to write this paragraph.

WHAT IT IS THAT PULLS A PERSON DOWN — "It is not intellectual work that injures the brain," says the London *Hospital*, "but emotional excitement. Most men can stand the severest thought and study of which their brains are capable, and be none the worse for it, for neither thought nor study interferes with the recuperative influence of sleep. It is ambition, anxiety and disappointment, the hopes and fears, the loves and hates, of our lives, that wear out our nervous system and endanger the balance of the brain."

COMMON CAUSE OF DYSPEPSIA.—One of the most common causes of dyspepsia is eating heartily when the system is tired and jaded. When exhausted by either mental or physical work, we are usually ravenously hungry, and, of course, turn to food as the means of restoration. The fact is seldom appreciated that the stomach shares in the depression caused by overwork, and hence at such times is unable to perform its ordinary duty. The food taken then is but very slowly digested, and before the process is completed fermentation often takes place. If it does, the consequence is that we are in a worse state than if the food had not been taken, for the fermentation generates acids and gas, which in turn not only interfere with digestion, but excite other disturbances. In a very strong and healthy person the ill effects of eating when the system is much fatigued would not be so marked as in one below the standard of health. Very nervous individuals suffer from the habit, and if debilitated, they are quite sure to grow more so if it is persisted in. When very "tired and hungry," it is always best to rest for a time before eating, or to take some such simple "pick-up" as hot milk, which should be slowly sipped. That is very refreshing indeed, and usually meets the requirements quite as well as an alcoholic stimulant.

TO PREVENT RHEUMATISM.—We have entered the season when rheumatism is likely to be the most prevalent. After several months of warm weather, the systems of those who have not been fortunate enough to evade the heat, in shady places at summer resorts, are relaxed, weakened, and more or less choked up with waste, says the Boston *Herald*. Exercise, the great eliminator of waste material, is quite naturally neglected during the hot weather. And, what is equally unfortunate, those who exercise too little are sure to eat too much. So autumn finds them in a sluggish state, as we have said, with all the waste avenues more or less clogged up. That is a condition of things very favorable to rheumatism. Those who have a tendency to that disease should "take a stitch" now and free their systems from all injurious retained matter. They should live abstemiously, exercise freely, keep the skin active by frequent bathing, the bowels open with fruits, and drink water in large quantities. Water dissolves and washes waste matter out of the system; it is therefore an absolute essential where there is any impairment in the action of the kidneys, bowels or skin. He who applies this simple treatment, and takes proper care of himself otherwise, may feel quite secure from attacks of rheumatism.

A SIMPLE EXPERIMENT which will show how injurious is cigarette smoke inhaled may be easily performed by means of a handkerchief. After taking a mouthful of smoke, put the handkerchief tightly over the lips and blow the smoke through it. You will find a dark-brown stain on it. If the smoke is inhaled, and then blown through the handkerchief, there is very little stain, if any; consequently all that nicotine must remain in the lungs.

A GREAT CITY OF THE DEAD.—The total number of bodies registered as buried in cemeteries used by London is 1,276,875.

USEFUL INFORMATION.

HOW TO WASH MILK CANS.—In washing out milk-cans and pans, where there are quite a number of them, it is the general custom with many to pour boiling hot water into a few, allow it to stand there for several minutes, and then pour it into others and so on—one supply of hot water made to suffice for the cleaning of all. It naturally follows that the water soon loses much of its heat, and those vessels in which it is used last are very indifferently treated, and cold water would have been quite as serviceable in some respects. Whatever is used to hold milk should be boiled before it is called into service. Warm water may be sufficient for the removal of dirt, but neither that nor even boiling water used as described will clean cans, etc., as they ought to be cleaned. Milk is notorious for its absorbent powers, taking up bad odors and the germs that float in the air. It is also one of the best mediums known for the growth of such germs. Boiling water will kill such germs, if they remain in it long enough, but a hasty contact is never sufficient to destroy them or their spores—or seeds—which latter are very hard to kill. To clean milk vessels properly they must be filled with water and then be put in a hot oven or on the top of a hot stove to boil. And if boiled well for a few moments they are made safe; that is the only domestic way of making them so. One observer recommends the use of sal soda in washing milk vessels because it acts chemically upon fatty matters—grease—and thus helps to remove them and other materials which adhere to the vessels with them. In like manner the use of live steam to dry vessels after washing has the advantage of sterilizing them, *i. e.*, killing the bacteria by the highly heated steam.—*Boston Herald.*

SOME OF THE GOOD AND BAD USES THE POTATO IS PUT TO.—Science, says the *Mechanical News*, is constantly finding new uses for familiar substances and products. The humble potato has been thus elevated to a position of increased importance, quite beyond what is customarily ascribed to it. For instance, saying nothing of the numerous forms in which it is made serviceable in the culinary art, a recent writer mentions that in Germany spirits are made from it and exported under the name of "Stettin brandy;" that a good deal of French cognac has no real origin in the grape, but is, in fact, spirits of potato; that eau de cologne is extensively made from the same useful tuber; that after the farina has been extracted, the potato pulp is made into picture frames, boxes and toys; and finally, that the water expressed in the process is found to be a valuable scouring fluid. The man who makes two blades of grass grow where but one grew before has been accepted as the typical human benefactor; but he should rank no higher than the genius who makes one potato more useful to mankind than a half dozen were before his advent.

THE INMAN STEAMSHIP LINE.—It is quite well known that, notwithstanding foreign flags fly over most of the deep-sea vessels in the harbors of the United States, there is nevertheless much American capital invested in such vessels. There are several vessels with a foreign flag and foreign register which are constantly sailing to and from San Francisco and various foreign ports, which are, nevertheless, owned to a greater or less extent by San Francisco capitalists. The same is no doubt true of most of our large seaboard ports. Even the most extensive steamship line in the world—the famous Inman line of New York and Liverpool—is nearly altogether owned by American capitalists. An Eastern paper says: A majority of the stock in the Inman steamship line, to which the City of Paris belongs, is said to be owned by Americans. Andrew Carnegie is reported to be a large owner, and the late Mr. Thaw of Pittsburg was said to hold stock valued at $1,000,000. The editor of the Chicago *Tribune*, Mr. Medill, who was a passenger on the City of Paris on her recent fast trip, is reported to have explained that the ship and the results attained by it were due to American enterprise backed by American capital. He knew that the application of American inventions to the machinery of the steamship had increased her speed one knot an hour, and that *nine-tenths of the capital* of the Inman line was American money. A State Senator of New Jersey, Mr. Warwick, confirmed what Mr. Medill said of her ownership.

THE RECORD OF A STREET-CAR CABLE.—The following record of a street-car cable that recently wore out its life doing duty on the California-street road will be read with interest. It was first published in the *Pacific Lumberman:* The diameter of the cable when laid was one inch and a quarter, but 20 months of constant hauling and wear over the pulleys and through the grip thinned it down one-eighth of an inch. Its length was 17,513 feet, and its weight, 44,604 pounds. For nineteen hours a day it kept moving every day for 20 months, and as its speed was seven miles an hour, the distance it traveled was 79,800 miles. It transported about 6,000,000 passengers, or about six times the population of the State, and turned over to the company $300,000 worth of nickels, being at the rate of $15,000 a month, or $500 a day. As the total power of the road was 400-horse power, it may be calculated this rope was doing as much hauling while in motion as 200 horses, and as each car hauled by horses uses four teams a day, the daily work of this cable was equal to that of 800 horses, with a deduction, however, for the great power required to move 44,604 pounds of cable. The cable was composed of six strands of steel wire cables, each one containing 19 wires varying in size from six to eight wire gauge, and twisted around a stout hempen core five-eighths of an inch in diameter.

CENTERS OF POPULATION.—Within a circle whose radius is 500 miles around Chicago there are 21,914,947 persons, and 54,801 miles of railroad. A circle of the same radius around New York City embraces only 19,941,602 persons and 30,369 miles of railroad. A 500-mile circle around St. Louis embraces a population of 23,714,000, and reaches within a few miles of New Orleans. This fact of a larger population within easy reaching distance forms one of the claims which St. Louis puts forth as the proper place for holding the proposed international exposition of 1892. It will be observed that the 500-mile circle around New York contains the smallest aggregate of population of the three cities named, but neither of the others presents such facilities of communication with other nations, which forms a most important factor in fitness of locality for an international exposition.

A WOMAN MACHINIST.—A Belfast, Me., lady, who believes that woman is capable of performing much labor that is now exclusively done by men, has entered a machine-shop in that city, and is learning the machinist's trade. The proprietor says she takes hold of the work as readily as any apprentice he ever had, and does her work in a remarkable manner. With an apron covering her dress, she stands up to the lathe and does her work as though she enjoyed it.

A NEW DECORATIVE PROCESS.—The old process of decorating china is likely to be revolutionized by a discovery made by J. B. Bonnaud, a Frenchman. By his method it is possible to obtain in a few minutes the same artistic effects which cost the hand painter on china days of labor. Landscapes, groups of figures, and portraits are produced by this means on vases, plates and plaques, in their natural colors, even to the most delicate shades.

ENGINEERING NOTES.

THE RENAISSANCE OF THE CANAL.—We have heard a good deal lately about the abandonment of canals on account of the greater cheapness of railroad transportation, especially in the United States. No wonder our canals are being abandoned, for, such as they are, with their miserable towpaths, small cross-section, unstable banks and mule motive-power, they are relics of the days of the stage-coach, and it is high time they gave place to something modern. There will be a reaction here, as well as in England, some day in favor of canals, but they will be ship canals, with steam for motive-power, and capable of floating the largest vessels. The Nicaragua canal is the first one we need, to give us cheap transportation between the Atlantic and the Pacific. If the British and Canadian Governments can afford to spend hundreds of millions of dollars in building the Canadian Pacific railroad, in establishing docks at Esquimault, and in subsidizing steamships from Vancouver to China and Australia, what should not we be able and willing to do to tie together by water our eastern and western sea coast? The Erie canal has been one of the greatest causes of the prosperity of New York City and State. It is capable of doing yet more for both, and the most far-sighted and liberal policy should be adopted in regard to its enlargement. After the Erie and Nicaragua canals may come the Florida and the Cape Cod ship canals, on our coast; the James river and Kanawha canal, to connect the Ohio river with the Atlantic ocean; the Hennepin canal, to connect the lakes with the Mississippi, and the proposed canal between Lake Erie and Pittsburg, to connect the lakes with the Ohio. If it pays England to put a ship canal between Liverpool and Manchester, what would it not pay us to build these more important canals in America?—*Engineering and Mining Journal.*

A TUNNEL A CENTURY IN ITS CONSTRUCTION. An engineering work that has been a century in course of construction forms one of the most notable landmarks of engineering history. Its construction may also be said to be a fair exposition of the progress of that class of engineering during the past century. This tunnel has been but recently completed and is referred to by the Glasgow *Engineer* as follows: The tunnel, or adit, is at Schemnitz, in Hungary, its construction being agreed upon in 1782, with the object of carrying off the waters from the Schemnitz mines to the lower part of the Gran valley. The work, which is now complete, forms the longest tunnel in the world, being some 10¾ miles long, or about one mile longer than the St. Gothard tunnel, and 2½ miles longer than that of Mount Cenis; the hight is 9 feet 3 inches, and the breadth 5 feet 3 inches. This tunnel, which has taken so long a period to bring to a completion, has involved an expenditure of about £1,000,000, but the saving to those interested, in being able to dispense with water-raising appliances, amounts to a large sum annually. A fact of no little interest in carrying out this project is that, though the latter generation had greatly the advantage in the matter of machinery for accomplishing such work, the cost of labor was greatly in the former's favor. The original contract was for the completion of the tunnel in 30 years, at a cost of £7 per yard run, and for 11 years the construction was carried on at that price. Public events, however, interfered with the progress of the work, as well as enhanced the cost of labor and materials, the cost per yard eventually exceeding £20.

THE GREAT BEAR RIVER CANAL, in Utah, for the construction of which $2,000,000 has been provided, is expected to be one of the most extensive irrigation works in America. To get the river along the side hill along Bear river canyon and out on to the plain near Plymouth will necessitate moving 220,000 cubic yards of solid rock, 19,000 yards of loose rock, 1,528,000 cubic yards of earth, and digging 1200 feet of tunnel. This canal will irrigate 200,000 acres in Salt Lake valley, and 6,000,000 on Bear river, increasing the value of the land to $50 per acre, while fencing, building and tillage are expected to double this valuation in a few years. Bear lake is in Southeastern Idaho. The reservoir for this canal covers 150 square miles, and the canal will secure the irrigation of a territory extending to Ogden.

RAILROADS IN CHINA.—China is starting apparently on an area of extensive railroad construction. Bids have been received by the Government for constructing the first section of a railway from Peking to Chinkiang, which means a very large expenditure both for construction and equipment.

THE GIGANTIC PROJECT in France for connecting the Mediterranean with the Atlantic ocean by a grand ship canal through the center of that country, seems to be taking shape more surely than ever since the failure of the Panama canal. The French people are irrepressible.

THE VOLUME OF NIAGARA.—The volume of water pouring over Niagara Falls at an average stage of the water is estimated in weight at about 563,000 tons per minute. In comparison the amount of water in the recent flood at Johnstown was but a pint cupful.

Passing Events.

From all over the coast there are complaints of the dryness. Streams have failed more or less all over the Pacific Slope. A great many quartz-mills have had to close down or hang up some of their stamps. The river-bed miners, however, are having a good season for their branch of the industry.

The announcement that the Big Bend tunnel enterprise is a failure by reason of the cost of removing boulders from the bed of the river is not credited either in Butte county or here. It is stated that 20 men have been clearing $7.50 per day to the man for the company, working in a very inexpensive manner. The enterprise has hardly been given a fair trial thus far, notwithstanding the sensational dispatches sent from the East.

There is some trouble in this city with the molders in the foundries, but the foundrymen are adverse to making any concessions to the men and will stand together in the matter of resisting any unreasonable demands.

There have been some fears concerning the miners who are wintering on Forty-Mile creek, Yukon river, Alaska, but J. G. Davis, who has recently come from there, says the men are comfortably housed and have plenty of provisions to last all winter.

The Water Dispute on the Carson River.

Our Virginia City, Nevada, exchanges are devoting considerable attention to the dispute over the water question now going on between the farmers on Carson river and the owners of mills on the same river. At this distance from the field of dispute it looks very much like the farmers stand in their own light when they attempt to control the waters of the river to the detriment of mill-owners. The farming community is dependent upon the mining industry, for without the latter there would be no profitable market for the farm product, and therefore farming lands on that river would be uncultivated. The millmen, through Hon. Francis G. Newlands, in a commendable spirit, have offered a compromise that will do away with all future disputes and give all in interest an ample supply of water the year round. The compromise offered is for the mill-owners and the farmers to each contribute so much money for the building of reservoirs for the storing of water for use during the dry season. This is a fair and just proposition. It goes without saying that with ample water-power not only all the mills now built could be run, but others could be built and run the entire year. The dropping of all the stamps would give profitable work to a larger force of men in the mills and mines, and the more given employment the more products of the farm will be consumed.

The farmers should not look at the subject from a one-sided selfish standpoint, and they must concede that the millmen's action is dictated by a spirit of conservatism grounded on the broad plan of the greatest good to the greatest number. They must also recognize the fact that the millmen are not overanxious to kill the goose that lays the golden eggs, which is better illustrated in their recently reducing the mill charges $1 a ton. This reduction in mill charges is without doubt very important to the mining industry at Virginia City, for it will admit of large quantities of low-grade ore being worked, which means the giving of employment to larger forces of men. This spirit of enterprise, looking to the more profitable working of the mines, should be met by the farmers in aiding by all means in their power the securing to the millmen throughout the year all the water-power possible through the building of reservoirs. In doing this they place the mining industry, upon which they are dependent, upon a surer and more stable footing.

Annual Assessment Work.

The bill introduced into Congress by Senator Stewart of Nevada, changing the date for the annual assessment work on unpatented mining claims, did not become a law. But at the same time there is no law which compels the miner to put off that work until the 1st of January. If the work is done now it will save considerable trouble and inconvenience. It is foolish to wait until December when the snow is on the ground in the mountainous regions. A great deal more can be accomplished now for the same expenditure of labor and money. Frozen ground is not much easier to work than rock.

The men who intend to hold their claims must do this work within the year, according to law. It was a necessity to fix some stated period and date; but the work can be done at any time in the year before that date. There is nothing at all gained by waiting until the last moment, but on the contrary there is less accomplished, and more discomfort, in waiting until the dead of winter.

Of course, many miners only do this work because the law requires it, but they should remember there is a gain to them in performing it, since it leads to a certain amount of development on the claim. Every year when this annual expenditure work is going on we hear of strikes in claims. Any man may have this same luck. If the law provided that the work must be done by October, it would be done; there is no reason for not doing it in that month, law or no law. It will only be a short time now before the snow flies on the mountains, and those who take time by the forelock can have the laugh on their procrastinating brethren of the pick.

THE Rae process of amalgamating ore pulp has been introduced in the Occidental mill.

That Big Gold Bar.

Our friends of the *Montana Mining Review* accuse the "mining papers of California" of seeking to belittle the big gold bar sent East by Col. Broadwater by alluding to it as worth about $100,000. The *Review* says: "The facts in the case are that Montana's gold bar, the product of only three mines for one month's run, and which was worth exactly $101,385.50, is the largest gold bar ever cast of which there is any authentic history. It is but natural, of course, that California should feel jealous of the stripling Montana, used as she is to being lovingly alluded to as the 'Golden State.'"

The PRESS is probably alluded to, since we gave the approximate value and dimensions of the Montana bar, but also gave the exact value and dimensions of a gold bar cast in California some years since, the latter being the larger.

The *Review* is mistaken in its claim that the Montana bar was the largest ever cast "of which there is any authentic history."

The writer of these paragraphs was one of many persons in San Francisco who saw the big bar which was made from gold of the North Bloomfield mine. Its weight was 511½ pounds troy. The length was 15 inches, width 6 inches, and depth 7 inches. It contained 630 cubic inches of gold, worth about $19 an ounce, the total value being $114,000—the largest bar ever made.

As according to the *Review's* own account the Montana bar was worth $101,385.50, it cannot be called the biggest one ever cast, when we have "authentic history" and personal observation of one made here worth $114,000. Moreover, the California bar was made from the product of one run of one hydraulic mine, while the Montana bar was the result of the product of three mines.

There was no attempt by the California mining papers to belittle the Montana bar. Attention was simply called to the fact that its claims of being the biggest bar ever cast were incorrect. On the strength of this mistake this same paper heads one of its articles, "Montana, the Golden State." Yet the statistics of production of precious metals show California a long way in the lead still as a gold producer, both annual and total. For instance, California produced in gold alone last year $12,750,000, while Montana produced at the same time $4,200,000 in gold. It is true, Montana exceeded in total production of precious metals, but was way behind California in gold, as the figures show. The statistics were taken from the report of the director of the United States Mint, those for California having been prepared by Israel Lawton of the United States Mint at San Francisco, and those for Montana by Spruille Braden in charge of the United States Assay Office at Helena.

While Montana comes next to California in the annual product of gold, it does not yet come up to one-half the product of California.

The State of California has produced since its mines were discovered, up to the end of 1888, according to the U. S. Mint statistics, a total sum of $1,221,260,550 in gold alone. When some other State or Territory can come up to that "billion" mark, not counting the couple of hundred millions beyond, it can take from us the title of "The Golden State." Thus far none of them have come anywhere near it, not even Nevada, whose total product comes next to that of California.

Montana is showing a most magnificent product of precious metals, and is leading all her sister States and Territories at present, just as California once led, then Nevada, and then Colorado. It was only last year that Montana took first place. But there is something doing in mining outside her borders. There is no need of any misrepresentation for her to hold her proud position. She neither made the biggest gold bar, the biggest annual gold production, nor the biggest aggregate gold production. These honors belong to California. Montana has honors enough of her own in precious metal mining without need of claiming those that do not belong to her. Let her strive to hold first place as many consecutive years as California did, which will be quite a little undertaking.

ANOTHER effort is being made by Pioneers and Native Sons of the Golden West to purchase and preserve what is left of Sutter's Fort. The fort and land surrounding it belong to Benjamin Merrill of Chicago.

Mines on Railroad Grants.

A decision has recently been made by the U. S. Supreme Court in the matter of the application of two Montana mining companies for patents, which is calculated to excite some alarm among prospectors and miners. By the decision referred to the adverse claims of the Northern Pacific Railroad Company filed against the applications for patents made by the mining companies are successfully maintained. Of course, acting as a precedent, the decision will bar all other applications for patents to mineral lands within any of the sections of land included in the grants made the railroad company by the United States. Under the decision, title to every unpatented claim located along the main line of the Northern Pacific railroad is seriously affected, and the only relief obtainable is through congressional action.

In this State also, as well as in some others, this question of mineral or railroad lands is going to create trouble. Only this week there is an instance which came up before the Register and Receiver of the Land Office at Sacramento. The land in controversy was on the Georgetown divide, El Dorado county, and embraced 32,860 acres which was originally returned by the Surveyor-General as mineral land. The Central Pacific Railroad Co. subsequently listed the land, but the Government refused to issue patents for it, basing its refusal on the return of the Surveyor-General. The late contest was to decide whether the land was mineral or agricultural in character.

A large number of witnesses were examined, but there was no evidence produced that the land was mineral in character, except 2860 acres, which the railroad company relinquished. The other 30,000 acres were decided to be agricultural lands, and if the Commissioner of the General Land Office affirms the decision of the local land office, as he undoubtedly will, the railroad will receive a patent for the disputed land.

Little by little the area available for the prospector is being narrowed, and by and by most of the mining ground will be within agricultural boundaries or those of a railroad grant.

Cable-Road Patents.

The American Cable Co. of New York has commenced suits against the cable railroad companies of this city, claiming that under the Thompson patents the roads here are infringers. They claim that the Thompson patent covers the general principles of cable roads as well as tube, slot, grip, cars, etc. There are some hundreds of separate patents in cable-road appliances, most of which belong to the Pacific Cable Co. by purchase. The Abel Thompson patent was issued Oct. 1, 1872, just 17 years before suits for infringement were commenced. It was never tried, and its term of existence has expired. In effect, Thompson's idea was to run a locomotive in a subway or tunnel connecting it with a car on the street above, by a bar or chain, through a suitable slot.

This has never been done and probably never will be. The idea of running an endless cable in tubes or tunnels is entirely different in every way. Thompson's "claims" in his patents are as follows:

First—The tunnel below the railway track and street provided with rails for an independent locomotive engine and a longitudinal opening through the top of the tunnel for the connection that comes from the locomotive to the car.

Second—A tunnel made of transverse trusses open at the upper portion and connected by longitudinal bars, etc.

The first of these claims covers the idea of moving the cars by a moving locomotive, while cable cars are propelled by a stationary engine through the medium of an endless cable. The second claim, however, is more to the point, for it covers the general features of the tubes or subways in use on all cable roads. It is this claim which forms the basis of the suits. While it does not mention yokes, such as are used, the construction is in effect a yoke. Such construction may have been used before, however, for conduits, sewers, etc. The cable companies will have to prove either that Thompson's invention was anticipated or that they do not infringe the patent.

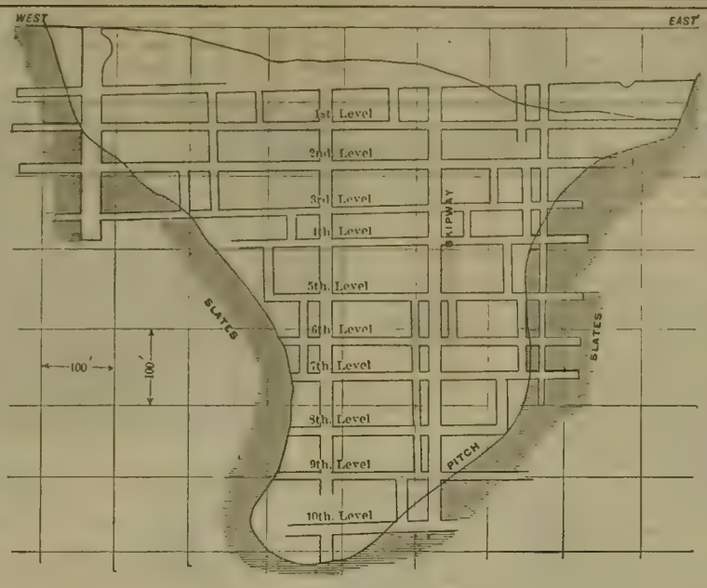
THE prospectors who have been in the mining fields of the islands adjacent to New Guinea have returned with discouraging reports.

Rock-Filling in Mines.

In last week's PRESS was given some account of the use of rock-filling in the Menominee range mines, Michigan, with a drawing of the West Vulcan mine, showing the general position and pitch of the ore deposit.

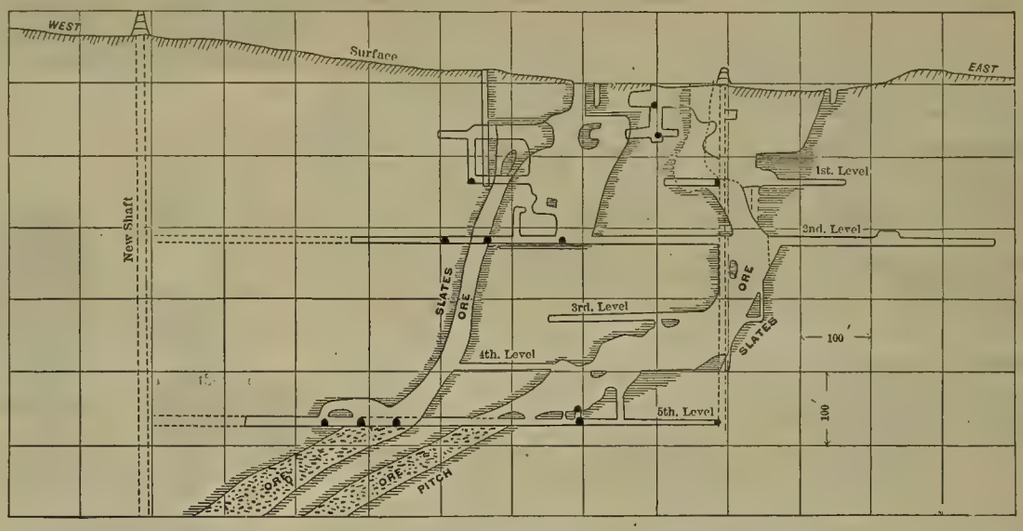
The accompanying drawings show the method of the rock-filling used in place of timbering. From the shaft "*A*," a drift cuts the ore body and 25 feet into the footwall of firm jasper slates. From this point a rock tunnel is driven in the footwall east, as shown on plan, to shaft "*B*." Along this rock tunnel ports are made at intervals of about 100 feet into the ore body. From these ports the mining of the ore begins on the bottom of the ninth level.

The first cut of this ore is mined about eight to ten feet high, and the spaces from which the ore has been removed are filled with rock. This rock-filling follows the mining and affords absolute safety and inflexible support to the walls of the mine. The broken rock for filling is conveyed down the winzes *B*, and the ore through the shoots *D*, which are built up as fast as the filling is made upward. It will thus be seen that the tunnel in the footwall secures absolute safety to the mainways of each level; it is out of the crush range in any event. The winzes or rock-mills are also ventilators, and greatly improve the sanitary condition of the mine.



The ore body is, under this system, attacked by the miners on double face at each portal *C*, from the main rock-level or tunnel in the footwall. The mining by sections upward is simply a repetition of the first eight or ten feet, the rock-filling following the mining work and filling the spaces from which the ore has been removed as rapidly as room for the mining operations will permit.

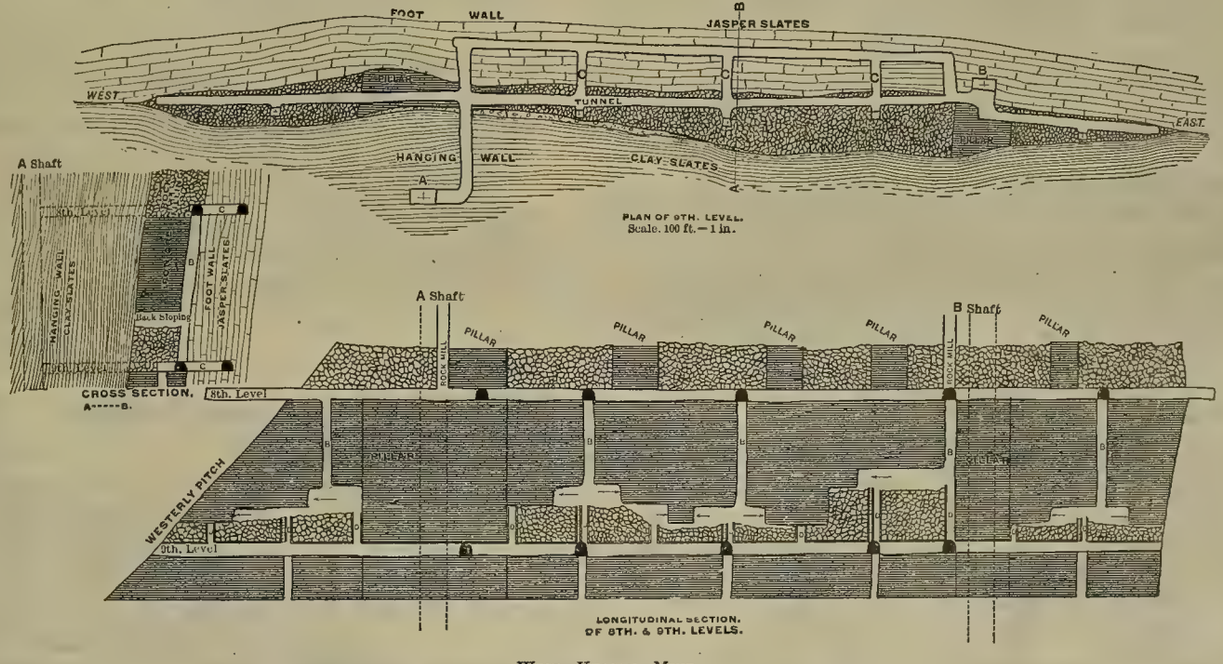
Some timbering will be required occasionally in this rock-filling, especially in sustaining the filling in upper levels, as it is approached from below in removing the last cut of ore.



It may be noted here that this rock-filling system has not been evolved from any special progress in the mining art, or in the line of its economy over the Nevada system of timbering, but has been compelled by the absolute necessity of the case in West Vulcan and all other mines in this range where it has been introduced.

It may be said that sufficient work has not been done to submit an accurate statement of the relative expenses of these two systems.

However gratifying this comparison would be, if it indicated economy on the side of the rock-filling, yet this is not the vital factor governing the change of method from timber to rock, but rather the latter is a compelled requirement to secure the stability of the hanging-wall of the mine. And further, it may be pointed out that such a statement at any time would not afford a permanent basis of comparison, from the fact that the magnificent pine forests of this section of Michigan are fast disappearing under the great drain for these mines and Eastern markets, so that the timber-supply is becoming year by year enhanced in value by scarcity and lengthened haulage. It is, therefore, a constantly shifting factor of expense in mining operations.



QUINNESEC MINE.

LONGITUDINAL SECTION.

EAST VULCAN MINE.

WEST VULCAN MINE.

METHODS OF MINING IN THE MENOMINEE RANGE, MICHIGAN.

The rock, on the other hand, is inexhaustible; and in spite of some little variableness in the cost of breaking it up and sliding it down into the mine, is a much less fluctuating factor of expense than the wood for timbering. The cost of timbers and timbering, per ton of ore mined at West Vulcan during 1887, was 38 cents.

The cost of rock-filling, with its necessary use of some timbering, per ton of ore mined, is estimated at 20 cents per ton—14 cents for rock-filling and 6 cents per ton for the timbering required with rock-filling. These estimates require verification by a few years of actual work. It may be pointed out here that the rock filling affords a permanent support, which is not liable to decay as is the timbering system, and will not require renewals during the progress of the mine workings.

The great caverns of ore in the Norway mine compelled rock-filling about two years ago, so that Captain John Oliver of Norway was one of the pioneers in the application of this system.

The Chapin was also forced to use this rock-filling system to maintain the walls of its great ore deposit, and was the first on this range to apply it.

Many of the mines, with firm walls and at moderate depths, continue to use the timbers in steadying their works, but the rock system must commend itself rapidly to all these mines from its great safety, stability and facility for exhaustive mining.

There are other important factors in connection with the general application of this system of rock-filling. The location of the shafts or slopes to the mines is one. The first planning of these slopes or skip-ways placed them in the ore body, requiring large pillars of ore for their maintenance. Where the ore is of moderate thickness (10 to 15 feet), this method is not so open to criticism; but when the ore body is 20 to 50 or 100 feet thick and rather soft, it has serious drawbacks in the great pillars of ore

which must be set apart for this purpose, and in their tendency to crumble, especially in the event of a creep or crush, which follows in a greater or less degree in exhaustive mining.

The use of skip-ways in the footwalls, or the sinking of shafts in the hanging-walls, are matters of the greatest importance in assuring safe and economical mining. It has been shown that slopes or skip-ways in the ore body are open to serious objections in large deposits of ore.

It is quite possible to sink the slopes or skip-ways *in the footwall*, especially when this is composed of firm jasper-slates. They could be driven in the footwall, and a sufficient distance under the plane of the ore, say 10 to 20 feet, so as to assure a permanent rock tunnel under all conditions of creep or crush. But this system has some exceptions, as in the case of the East Vulcan mine, with its ore body flexed and pitching, as shown in the longitudinal section. It will be evident that a slope or skip-way in the footwall slates of an ore body so placed would have been impracticable. But there are many deposits where a slope or skip-way could be driven in the footwall of an ore deposit, and be readily made to conform to the flexures met, in ordinary cases, in these footwalls.

This method would be costly at first, but it would ultimately be found to assure great safety, and permit exhaustive mining, since no pillars would be required for its protection.

This East Vulcan mine, after passing through the early stages of mining, adopted the vertical shaft for winding and pumping. It is now 500 feet deep. At 400 feet deep the ore body pitched rapidly westward, requiring a long rock tunnel from the shaft to the ore body. It will readily appear that with the continued westward pitch the lengthening rock tunnels at each level could not be maintained, as their increasing cost would debar their use. Hence, in this case, after testing the pitch of the ore body, it was concluded that a new shaft, 800 feet west of the old one, should be put down. Work on the new shaft is now in rapid progress. It is designed to produce the tunnels in the levels of the old workings, until they reach the new shaft, to assure good ventilation, and also to explore the intervening mining ground.

This new shaft will pass through the ore bodies and reach a point at which its levels or rock tunnels will become too expensive if the present westward plunge of ore continues. But it is also probable that the ore body will change its present rather flat pitch. In any case, it is evident that sinking this new shaft in soft slates will be much less expensive than continuing the old shaft with its increasing lengths of rock tunnels in jasper slates.

This case has been selected as affording an example that has furnished an abundant series of perplexing mining problems to its managers.

Mining Bureau Museum.

The following are among the recent contributions to the museum of the State Mining Bureau:

Barcenite (antimonate of mercury), a rare mineral, Huitzuco, Mexico, from J. W. Maxwell.

Crystallized stibnite, San Benito Co., Cal., Chas. Bronson.

Very fine specimen of linarite from Cerro Gordo, Inyo Co.; Wm. Crapo.

Ore from the Taylor mine, Death Valley, Cal., very rich in gold and silver; R. B. Taylor.

Pectolite, Tehama Co.; J. A. Heslewood.

Loadstone (natural magnet), Fresno Co.; R. Reynolds.

Fiorite, from the "Old Faithful" Geyser, Yellowstone Park; H. L. Hosmer.

Native antimony, Kern Co.; A. Blanc.

Columbite, Fresno Co.; R. Reynolds.

Specimens from the Superior gold mine, El Dorado Co.; Geo. H. Goddard.

Quartz with included rutile cut and polished, from Mokelumne Hill; Sam Sonnenfeld.

Manganese ore, said to be in large quantity and accessible, Mendocino Co.; R. H. Sinton.

Vanadinite, Arizona; Prof. Wm. P. Blake.

Native copper, Arizona; native silver on kaolin, Arizona. D. L. Mosgrove.

Zinc ore—sphalerite—Crow creek, Shasta Co.; S. S. Sweet.

REDUCING THE COST OF MINING PATENTS.—We maintain that it is just as much the duty of the Government to survey the mining sections of the country as it is to plat agricultural lands, and that if the mining portions were sectionized and subdivided the cost of surveying mining claims would be materially lessened, by enabling applicants for patents to connect the corners of their claims so many feet, in whatever direction it may be, from such section corners as are most accessible. A plat of the ground could thus be obtained at nominal expense, and numbered and filed in the Land Office, giving the location on fractional section, township, range, etc., and publication of intention to prove up and enter the claim should then be made the same as is now required on agricultural land, the cost of such being less than one-half of present charges. After publication, the applicant proves ownership and compliance with the law, pays for the land and receives his patent, the same as on an agricultural claim.—*Homer Mining Index.*

Mines and Prospects.

In the Colorado Mining Exchange, which has commenced operations so auspiciously, says the Denver *Tribune*, the directors have made a new departure by listing some of the stocks and heading them on the bulletin board on 'Change as "prospect stocks," the object being to let the public know when they are buying a stock which represents a mining property in which the value is prospective, and which stock is being sold for the purpose of raising money for development, as against a stock representing a mine which is paying dividends or even running expenses.

Although we are a mining State, it may be that the general public is not thoroughly versed in these distinctions and differences of mining properties, and in view of the revival in mining interests which now seems likely soon to become general throughout the United States, it may not be amiss to give our views on the subject.

In "prospects" there are various grades of value.

The prospect-hole, or discovery shaft or tunnel, sunk or driven ten feet only below the surface, and showing a good breast of ore on a lode which has developed and paying mines on it in other claims on the same lode, is a promising prospect; if the same one had, say from 100 to 300 feet of tunnel or shaft, showing the same ore continuously, and mill returns of the ore taken out in driving such tunnel or sinking such shaft showed it to be pay ore, it would be a still more valuable and promising prospect.

A big mining property, again, which had produced largely in the past, but in which the workings showed all the pay ore to have been extracted, and in which it would be necessary to drive further or sink deeper to discover more pay ore, is also in our opinion another class of prospect, and should be sold or listed as such. No worked-out mine should be sold on its past record at a value represented by the amount taken out of it.

The value of a mine is represented by what is in it, and not what has been taken out of it; and the value of a prospect is represented by what, according to good and careful judgment, may be or is likely to be in it.

The term "mine," speaking in a general way, covers a vast amount of various underground work and is extremely indefinite, but as used in searching for and extracting the precious metals and in contradistinction to prospects it means underground workings in a mineral property which has a certain amount of pay ore "in sight," *i. e.*, which is blocked out on four sides and can be measured and sampled, and its value reckoned, the same being generally known as "reserves of ore."

On the other hand, a big property which had produced large quantities of pay ore in the past, and which, while it had no ore blocked out or in reserve, had pay ore in the breasts of levels or bottoms of shafts, would still be considered a mine.

There are thousands, probably hundreds of thousands, of good prospects owned by individuals who are unable to put up the money the expenditure of which shall prove them to be mines.

Thousands of these prospects have been held for years in this embryo state, and will continue for years to come in the same way, unless through the medium of a well-conducted mining exchange the public comes to their rescue.

Notes About Butte, M. T.

The deepest mine in camp is the Lexington, 1400 feet.

The best timbered mine in the camp is the Parrot.

The largest hoisting engine in the camp is the Mountain Consolidated.

The handsomest, and as capable an engine as there is in the camp, is the Mountain View.

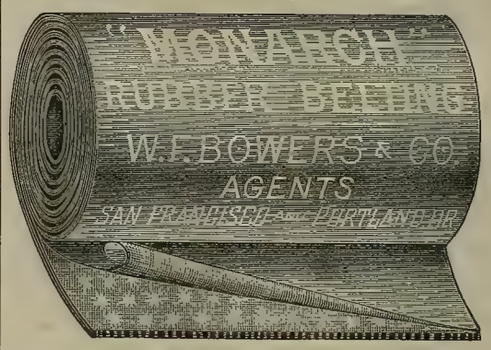
The mine containing the most timbers is the Anaconda.

The neatest little engine-room is at the Bluebird.

The cleanest engine-room is the one kept by M. C. Riley at the Lexington mill.

The fastest hoisting engine is at the High ore.

The smallest cars used on a cage are at the Wake-Up-Jim.



The flat cables are used at all the big mines with the exception of the old Colusa.

The new hoisting engine when erected at the Harris & Loyd new shaft will eclipse them all.

Stulls are used in some of the copper mines of this district, but in the large mines mostly square sets are used and few stull pieces.

The silver mines use stulls mostly in timbering their mines, though some square timbers are used in the Bluebird and Alice.—*Butte Inter-Mountain.*

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

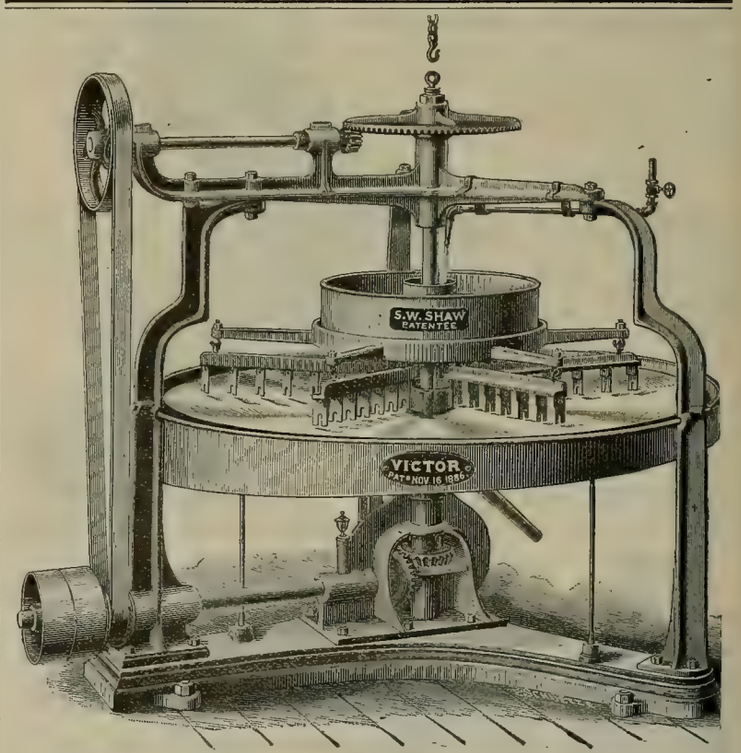
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use.



It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

227 First Street, San Francisco, Cal.

THE VICTOR CONCENTRATOR

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,

17 and 19 Fremont Street, SAN FRANCISCO.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING SEPT. 24, 1889.

411,572. — OBSTETRICAL INSTRUMENT — C. D. Bobo, Nevada City, Cal.

411,492. PUNCH—Jabez Draper, Stockton, Cal.

411,493.—BOOK REST AND EASEL.—John Ducker, Santa Rosa, Cal.

411,496.—ELECTRIC RAILWAY—Geo. B. Fraley, S. F.

411,434.—STEAM BOILER—A. Grant, Los Angeles, Cal.

411,500.—ROLLER-BEARING—R. W. Hent, S. F.

411,627.—STOCK-FEEDER — B. Walton, Crompton, Cal.

411,630.—CABLE-GRIPPER—H. M. Wrede, S. F.

The following brief list by telegraph, for Oct. 2d, will appear more complete on receipt of mail advices:

California—Philip Somers, San Francisco, vehicle axle; David L. Smith, San Francisco, fruit-drier: Carl Jaening, assignor of half to M. Pauly, San Francisco, hinge; George A. James, San Francisco, photographic printing-frame; John D. Keller, San Francisco, wind-wheel; William H. Lamrock, coyote exterminator; May E. Harrington, Oakland, mustache guard; James B. Harrison, San Jose, derrick; John M. Finch, Crockett, assignor of part to J. R. Cross, San Francisco, G. Hilley, Vallejo, and F. Miller, Marysville, separator; Albert Henry, Crescent City, elevator safety device; Johannes P. Becker, San Francisco, safety gas cock.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable prices, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC RAILWAY.—Geo. B. Fraley, S. F. No. 411,496. Dated Sept. 24, 1889. Considerable difficulty has been encountered in the construction of sub-electrical ways in properly insulating the conductor and in maintaining it parallel with the roadway, so that the trolley-wheel shall always travel in contact with it. In Mr. Fraley's invention this conductor is made of wire or cable, formed in sections of any suitable length. The patent covers certain details of construction which overcome the difficulties referred to.

BOOK-REST AND EASEL.—John Ducker, Santa Rosa. No. 411,493. Dated Sept. 24, 1889. This book-rest or support and easel consists of a vertically adjusted shank or standard with a fixed holding socket, a swivel-arm projecting from said standard and having a second arm adjustable upon it, an adjustable support suspended from the outer end of this arm, and in connection therewith a device whereby a book may be held open to any degree, and the leaves easily held in place when turned. With this the inventor employs a supporting easel by which the whole device may be secondarily supported from the floor and made more rigid when desired.

PUNCH.—Jabez Draper, Stockton. No. 411,492. Dated Sept. 24, 1889. This is an improvement in metal punches. It is especially applicable to carriage and other small work and for punching small plates not exceeding one-fourth of an inch in thickness, but may be increased in size for larger work if desired. The depression in which the die is secured is made of such length that the die can be reversed in it, the die having two holes of different sizes made through it, so that these two holes in the die will correspond with the different sizes of punches, which are used by simply reversing the die without other adjustment. The patent covers a number of details of construction.

South Yuba W. & M. Co. vs. Rosa.

Following is an abstract of the Supreme Court decision in the Nevada county suit entitled South Yuba Water & Mining Co. (respondent) vs. Delovico G. Rosa (appellant):

Water Rights—Foreign Corporations—A demurrer to a complaint that a foreign corporation has not filed a copy of its articles of incorporation in the office of the County Clerk of the county in which property in dispute is situated, properly overruled. Nonsuit on same ground properly denied.

Held, a failure to comply with Section 299 C. C. can only be made available as a defense by special pleading where complaint contains no averment upon the subject.

Held, the requirements of Section 299 of the Civil Code do not apply to foreign corporations.

Held, the riparian rights of the defendant as a homestead claimant are subject to the prior appropriation of the water passing over defendant's lands, the same being public lands of the United States, the defendant not having at the time obtained a patent therefor.

THE "Indian mine" excitement at Monterey has subsided, and the Carmel valley continues to hold the secret of the lost mine.

Mining Personals.

W. C. Price is superintendent of the Bell Isle, Tuscarora, Nev.

John F. Blandy of Prescott is Territorial Geologist of Arizona.

H. W. Cotha is superintendent of the Grand Prize mine at Tuscarora, Nev.

Wm. Pierce is foreman of the Hale and Norcross mine on the Comstock.

Sup't J. W. McGowan of the Senator (Arizona) mine is on the way back from Chicago.

Robert Sherwood, the capitalist and mine manager, has returned from his European trip.

The mineral cabinet of Wm. N. Kelly of Prescott, A. T., is said to be the finest in the Southwest.

H. M. Levy, president of the Savage and Hale and Norcross Mining Companies, is visiting the Comstock.

Col. S. H. Lucas thinks the Alamo district, Lower California, is the richest gold-quartz camp on this continent.

L. Hamilton, superintendent of the Chollar and Potosi, went back to the Comstock from this city on Tuesday last.

F. M. Murphy is superintendent of the Congress (Arizona) mine, where they have one of the finest mills in the Southwest.

A. J. Rose, Jr., prominently connected with the mining interests controlled by Hobart & Hayward, left for the East Wednesday.

Superintendent Weir of the Granite Mountain, Montana, has been making very extensive underground developments in that property.

Fred. E. Murray, superintendent of Big Bug properties (Arizona), is specially pleased with the developments on the Boggs and Hackberry mines.

Last week Mr. Phil Shenon, a well-known Montana mine-owner, sold a group of gold mines at Bannock, M. T., to the Carlisle Mining Co. of London for $175,000.

Mr. Arthur F. Wendt is in charge of the construction of the great Huanchaca plant, South America. The mine is at an elevation of 13,600 feet above sea level.

C. M. Hagadorn, who is heavily interested in mining on Hassayampa creek, is in Prescott, Arizona. His superintendent, Frank Dolph, is slowly recovering from a spell of sickness.

Albert Barber, superintendent of the Barber Mining and Milling Co.'s property at Calico, and for many years prominent in mining circles, was found dead in his bed last Wednesday. The cause of death is probably apoplexy.

James H. Crossman, assistant of the State Mineralogist, is now in San Bernardino county examining the various mines and mining districts. He will be in that section of country for some months.

On October 7th John Dunnicliff of Nevada City will leave San Francisco for Alaska, where he will put up sulphuret works for the Treadwell mine. George G. Allan of the Nevada foundry has the contract to supply the iron for the works.

Major McLaughlin of Oroville, who was one of the projectors of the Big Bend tunnel scheme, in which Dr. Pierce of Buffalo, New York, and others have put in about $2,000,000, does not credit the recent statement that the enterprise is a failure.

D. T. Hughes, a well-known mining man of this State, who has been engaged during the past two years in superintending the development of an extensive property in the Republic of Colombia, returned to this city last week. A number of English and American companies have already established extensive works at different points, which are now being operated with much success. The Orita and Malpaso hydraulic mines have paid well from the start, and in dividends have almost reimbursed shareholders on the original investment. The heaviest outlay of American capital has been made at the Bocaneme mine, located near Tolima, in the central range of the Andes. This property, which is of great prospective value, has been incorporated in New York, A. Harpending, formerly well known in local mining circles, owning the largest portion of the stock. Labor is cheap, the peons employed receiving from 75 to 80 cents per day, and timber of all kinds is plentiful and cheap. The route to the mines is by steamer from New York and thence up the Magdalena river a distance of 550 miles to Unga. The mines are then 18 miles distant over a good road.

FOSSIL DEPOSITS.—The Princeton college expedition to the John Day lake region, Oregon, report having dug up about two tons of bones of curious animals. Among them were little three-toed horses hardly larger than donkeys, rhinoceri, camels, peccaries, a great assemblage of large and fierce cat-like, dog-like and hyena-like animals, not to mention hosts of little rabbits and squirrel-like creatures. The animals of this time were all rather small, the largest being the entelodon, a beast not unlike the hippopotamus in size and general appearance. As the list shows, this assemblage has a very oriental character. This wonderful museum of buried worlds has been sealed up by subsequent lava floods, and is now accessible only on the sides of canyons and valleys, where streams have cut down through the overlying masses.

THE dynamos and other generating apparatus on the Sutro tunnel level of the Chollar incline are being overhauled by an electrician in order to have them in readiness as auxiliary power for operating the Nevada stamp-mill when water is available, which it probably will be before the 1st of November.

Reservations for Reservoir Sites.

The report of the Commissioner of the General Land Office shows that due recognition has been made of the Government work for irrigation now in progress under the auspices of the Geological Survey. The report shows that the following reservoir sites in California have been withdrawn from settlement:

Clear lake, Lake county, together with all the lands situated within two statute miles of the borders of the said lake at high water.

Independence lake, Nevada county, together with the lands bordering thereon. The lands included in said site are situated in sections 2, 3, 4, 5, 8, 9, 10, in township 18 north, range 15 east, the quarter of section 32, and sections 33, 34 and 35, in township 19 north, range 15 east.

Donner lake, Nevada county, together with lands adjacent. The lands included in said site are situated in sections 10, 11, 12, 13, 14, 15, 22, 23, 24 of township 17 north, range 15 east, and sections 7, 8, 15, 18, 19, 20 of township 15 north, range 16 east.

Webber lake, Sierra county, together with lands bordering thereon. The lands included in said site are situated in sections 20, 21, 22, 27, 28, 29, 32, 33, 34, township 19 north, range 14 east, M. D. M.

The Commissioner prints extended extracts from the reports of Surveyors-General of various States and Territories bearing on the subject of irrigation. The Surveyor-General of Nevada speaks encouragingly of the prospects for this State in case the Government's irrigation scheme is carried out, and deprecatingly of the conditions now existing in that State with relation to the annual rainfall and the necessity for the adoption of some system of irrigation.

Major Powell, Chief of the Geological Survey, is reported to have said that the arid land that can be irrigated and made productive in the States and Territories visited will amount to over 100,000,000 acres. The work of the Senate committee will be a preparation of a report upon the advisability of Congressional appropriations for surveys in the arid districts.

Your Own Photographer.

The Latest Fad in Stations and Hotels.

We are soon to have nickel-in-the-slot photograph machines in all the railroads and hotels, for a company has been organized in New York and the machines are being manufactured. The lens is so placed in the machine that it comes directly in front of the face of a person of ordinary hight. If the subject is too tall to get a reflection, he can sit down on the screw stool that is provided with each machine, and if too short he may attain the required elevation by mounting a pair of adjustable steps, which are also included in the patent. Back of the lens is the plate chamber, containing about 400 plates, on which the photographs are printed. After the person to be photographed has tickled the neck of the machine with the necessary quarter, he is required to pull a cord. Instantly the shutter in front of the lens opens automatically, and at the same time a flash of powder throws the necessary light on the face. The lens prints a likeness of the face on the first plate back of it. This is rolled over two small wheels to the bottom of the chamber, where it is taken by a pair of rubber tapes, which, in their turn, conduct the picture through the developing, fixing and washing fluids, and finally push it out of the machine a complete photograph. The plates are of celluloid, and the photograph is vignetted on a white background. The likeness is made instantaneously and the process is completed in less than two minutes. On each side of the lens is an arm extending out from the machine. On these arms are placed sample photographs showing one-third, one-half and profile views. The subject selects the view that suits him, and while he is looking at it a likeness is made of his face in a similar position. The machine thus arranged affords six different positions. Some of the railroads have applied for the machine, and by its use can make their "not transferable" thoroughly effective. The mileage ticket can no longer be passed around the family, for the photograph of the person who buys it can be pasted on it, and thus stop its use by any one but the proper owner. The thing would be very handy in a bank to secure the likenesses of rogues who secure payment on forged checks. There are hundreds of ways in which the machine can be used, and they are not confined to thief-taking.—*Boston Herald.*

Assessment Notices.

Lapanta Consolidated Mining Company.
Location of principal place of business, San Francisco, California. Location of Works, Hawthorne Mg. Dist., Esmeralda Co., Nevada.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 2d day of October, 1889, an Assessment, No. 2, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 2d day of December, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. STADTFELD, JR., Secretary.
Office, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

And in accordance with law, and an order of the Board of Directors, made on the 13th day of August, 1889, so many shares of each parcel of such Stock as may be necessary, will be sold at public auction, at the office of the Company, 303 California Street, room 11, San Francisco, California, on TUESDAY, THE EIGHTH DAY OF OCTOBER, 1889, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, 303 California Street, room 11, San Francisco, California.

AMERICAN MINING AND STOCK CODE

"KELLOGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded postpaid on receipt of price by

DEWEY & CO.,
220 MARKET STREET, SAN FRANCISCO.

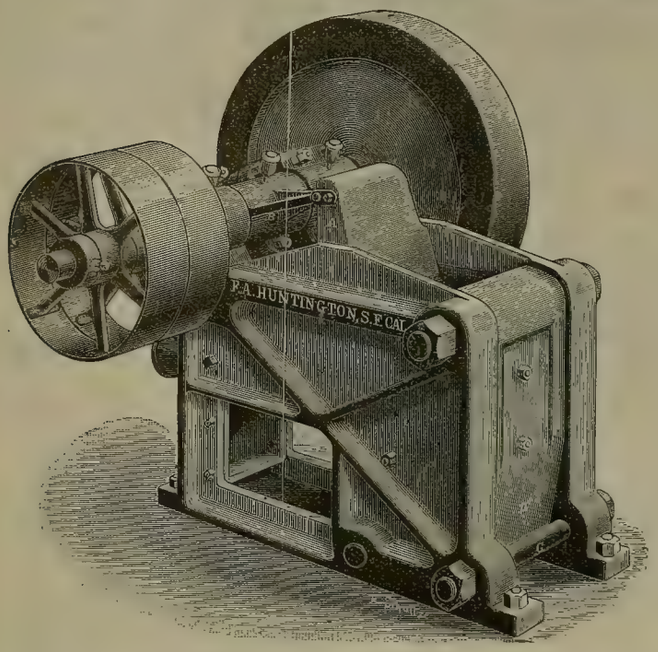
ATTENTION, MILLWRIGHTS!
A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill-owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, post-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

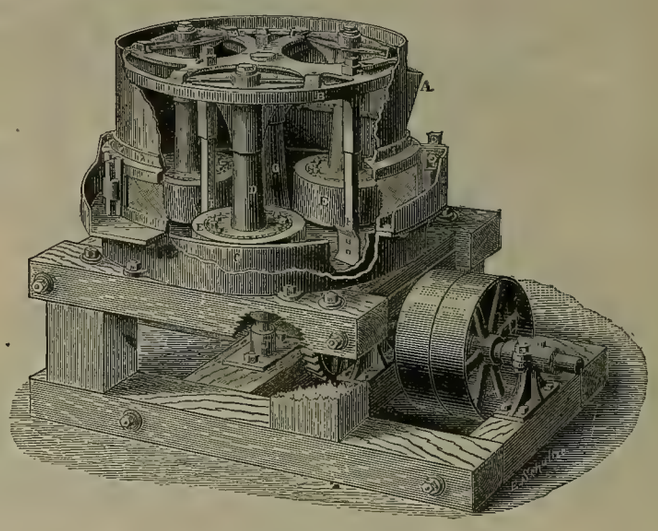


California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 220 Market St., San Francisco Elevator, 12 Front St

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.



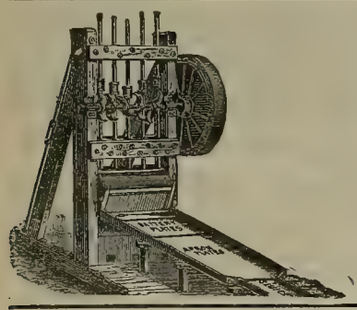
PRINCIPAL OFFICE, 213 FIRST STREET, SAN FRANCISCO.

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.



The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of **JOHN TAYLOR & CO., Corner First and Mission Sts.**

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal, E. G. Denniston, Prop'r.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

Over 800 in Use in all Parts of the World.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

120 FIRST ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 3, 1889.

General trade is improving. Iron-workers and foundrymen report more orders. Money is fairly easy, with remittances nearly equal to the call for crop purposes. The active money market at the East and a higher range of interest cause more coin to be remitted to New York. By the last steamer from Australia $1,777,317 was received, with more to follow.

S. H. Brooks, Assistant Treasurer United States at San Francisco, reports cash on hand Sept. 30, 1889, as follows:

United States Notes	136,609 00
National Bank Notes	13,805 00
Gold Certificates	101,710 00
Silver Certificates	125,815 00
Gold Coin	40,378,123 00
Standard Silver Dollars	17,863,244 00
Fractional Silver	6,436,414 00
Minor Coin	4,002 70
Total	$65,059,722 70

The shipments of silver from the Sub-Treasury into the interior of the State and elsewhere for the month were as follows:

Standard Dollars	$266,630
Fractional Silver	76,620
Total	$343,250

The dividends disbursed for the month of September compare as follows:

	1888.	1889.
Banks	$112,500	$120,000
Gas and Water Co.'s	123,300	128,500
Insurance Co.'s	6,000	14,500
Powder Co.'s	27,000	27,000
Street R. R. Co.'s	15,000	17,500
Mining Co.'s	231,250	253,500
Miscellaneous Co.'s	81,875	97,750
Totals	$601,925	$658,750

MEXICAN DOLLARS — There was a good demand throughout the week for shipment by the outgoing steamer to China. The price paid is quoted at 75¾ to 76.

SILVER—The local market has held very strong at an advance for shipment by the outgoing steamer for China. As high as 94 cents was paid. Silver is very scarce and can only be secured by bidding up, and even then all requirements cannot be met. The market at the East and in Europe shaded off some, but the tone is said to be strong. The recent decided advance in Russian roubles has a favorable effect on the market.

The local mint is in the market for silver, but the bids are below the market prices.

QUICKSILVER—Receipts the past week aggregate 100 flasks. The market is reported dull and easy. The scarcity of water in the mining districts is against consumption.

BORAX—Receipts the past week aggregate 800 ctls. The exports aggregate 601 ctls. to New York. The market is firm at steady prices.

LIME—Receipts the past week aggregate 4245 barrels. The exports by sea aggregate 350 barrels to Honolulu. The home demand continues strong.

LEAD—The market is without essential change. Exports the past week aggregate 3002 lbs. to Victoria, B. C.

TIN—Exports the past week aggregate 22,675 lbs. plate and 8387 lbs. pig to Victoria, B. C. The imports aggregate 1282 ingots from Australia. The market is strong at full figures. European advices are uniformly of a bullish character.

COPPER—A shipment of 53,300 lbs. of copper cement was made the past week to New York. For refined copper there appears to be a steadier tone, as if the late troubles are being amicably fixed up. The consumption at the East and in Europe increased during the recent decline.

CHROME ORE—A shipment of 391,375 pounds was made the past week to New York. The market is reported unchanged.

IRON—The market is quoted higher for both spot and to load. The stock here in first hands is placed at about 500 tons, with very little to arrive. The consumptive demand is freer. Imports the past week aggregate 800 tons of pig. Foreign advices report a strong and active market, with several Governments large buyers.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow.	Sept. 25, '89.	Sept. 4, '89.
No 1 Coltness	65s 6d	64s

" Glengarnock	60s 6d	56s 6d
" Dalmellington	50s 6d	50s 6d

Coal imports the past week aggregate as follows: From Tacoma, 2300 tons; Cardiff, 937; Australia, 18 954; Coos Bay, 1950; Departure Bay, 1400. Total, 25 531 tons. The market for Australian forward shipment is quotable higher, as is Liverpool steam and Greta. For spot coal, cannel, egg hard, and Greta are higher. The tonnage on the way to this port aggregates about 232,000 tons, against 197,000 tons at the same time last year. But the tonnage on the way to the Southern ports is much less, which makes the total tonnage about the same as it was last year. The demand with us is quite active for spot, to arrive, and loading. The call appears to be more of a consumptive than of a speculative character.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

SANDY BAR M. CO., Sept. 30. Capital stock, $5,000,000. Directors—Wm. T. Robinson, S. Heringhi, Wm. Kreling, Thos. A. McGowan and Jas. F. Leahy.

CITY WATER CO. OF SANTA CRUZ, Sept. 30. Capital stock, $500,000. Directors—Chas. B. Ludwig, Chas. Hervey Jackson, Frederick R. King, E. H. Rixford, C. K. Bonestell.

GLENN M. CO., Sept. 30. Location, Shasta Co. Capital stock, $1,000,000. Directors—Matthias Ault, J. S. Fields, A. C. Hammond, Benjamin Clark and Frank Korlick.

GRANGERS' COLONY, Oct. 2. Object, purchase and sale of real estate. Capital stock $150,000. Directors—A. S. Barnes, Eugene Anderson, Robert Husband, J. G. Whittington and Geo. T. Prescott.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Sept. 26, $2600; Mt. Diablo, Oct. 2, $6398; Cons. California and Virginia, Sept. 28, $59,582; Blue Bird, 24, $16,144; Alice, 24, $26,512; Butte & Boston, 24, $22,912; Lexington, 24, $17,888; Hanauer, 27, $2525; 28, $2350; Crescent, 30, $2025; Hanauer, 30, $5500.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MINING SHAREHOLDERS' DIRECTORY.

Mining Share Market.

The market for Comstock mining stocks the past week was of a decidedly mixed character. The general tone was weak up to yesterday (Wednesday) under strong bear points put out by the inside through "decoy ducks." With the weak points thoroughly circulated, the manipulators by cross orders eased off prices, thereby securing stock from outside holders. They have also been assisted by the well-grounded belief that the financial statements of the mining companies to be published on next Tuesday will be bad and give ample excuse for more assessments. By those who are in position to know it is asserted that the executors of the Sharon estate have been and are still selling stock; but this is either through with or will be soon. All the stocks sold are said to have been carefully taken in by the pool. This is claimed to have caused the break in the Gold Hill stocks in last August. Those who are usually well informed on the movements of the market for the Comstocks are quite bullish and confident of much better prices, based on manipulation first and merit afterward. It this should prove correct, then outside holders of stock who do not expect too much will have an opportunity of selling out and netting a good profit on their investments. In outside stocks there has been a small upward move in the Quijotoas; but the Bodies and Tuscaroras hung heavy at about blackboard prices. Eureka Con. has been inactive, but the tone appears to be strong.

From the Comstock mines the news begins to be of a more important character, yet everything points to several weeks before actual or best results can be known. The starting of a west crosscut on the 800-foot level in Crown Point is undoubtedly done to cut at this depth the ore found on the 700-foot level. On the latter level the finding of the ore allowed the manipulators to make a successful deal. Another west crosscut is to be started on the 900-foot level. The work going on in Belcher and Overman is very important. The west drift in Yellow Jacket is being pushed ahead as fast as possible. The west crosscut on the 300-foot level of Con. Imperial is in over 60 feet, and in ore, but the lode is broken. The indications are good as work progresses farther west. Mining men are watching with renewed interest the work going on in the Ward shaft. Still more important work leading from the shaft is to be inaugurated at an early day. This work will open up to better advantage Alpha, Bullion, Potosi and Chollar. The work going on in Alpha is being closely watched. In Hale and Norcross they are in good ore on the 400-foot level. This mine has large quantities of ore out ready for crushing as soon as the rains set in. As for that, several other mines have large quantities of ore ready for crushing as soon as the rains set in. From Best and Belcher, Gould and Curry, Ophir, Mexican, Union, and Sierra Nevada, advices are difficult to get, which makes knowing operators look for something important soon in that direction. From the outside stocks the news continues uniformly good from the Tuscaroras and Quijotoas, with only deadwork from the Bodies. Were it not for the fear of assessments it is thought stocks of the mines in the two first districts would do better on present showing.

The stock market opened to-day weak under realizing sales and short selling. After the Call prices were lower, but the tone was steadier. Important work in Challenge, Confidence and Yellow Jacket is to be commenced within a few days. The pumping out of the water in Crown Point and Belcher to about the 2100-foot level will be commenced in this month.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

THE New Mexico Exposition was opened on Monday. The display of minerals from the mines of the Southwest is said to excel in point of richness the Denver display.

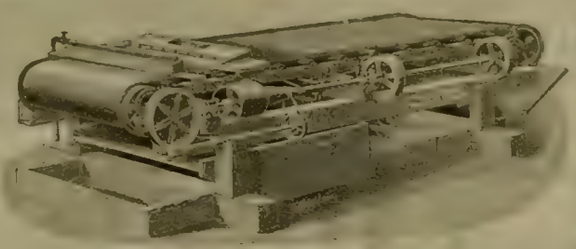
THE AMERICAN NEWSPAPER ANNUAL, published by N. W. Ayer & Son of Philadelphia, is one of the reference-books that we keep constantly within our reach, and would find it hard to do without. We have learned to look with pleasant expectations for its yearly coming, and we welcome the issue for 1889—the tenth of the series—which received the finishing touches toward the close of August, and has just come to hand. Besides containing a catalogue of all newspapers and periodicals published in the United States and Canada, arranged alphabetically by States and (within each State or Territory) by postoffices, with much information as to each one in detail, it gives a terse description of every State, Territory and county—area, character of soil, chief crops, manufactures, etc., and separate lists of class publications (*e. g.*, agricultural, religious, medical, etc.), with various tables which we cannot even enumerate. It makes an octavo of over 1000 pages and is cheap enough at $5, carriage paid, to any one who has frequent need to consult such a volume.



THE Colorado River Placer Mining Co. has been organized to work 100 acres of dry placer ground about 12 miles above Yuma, near what were formerly known as the Pot Hole placers, on the Colorado river. The ground has before this been worked on the dry-washing plan.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

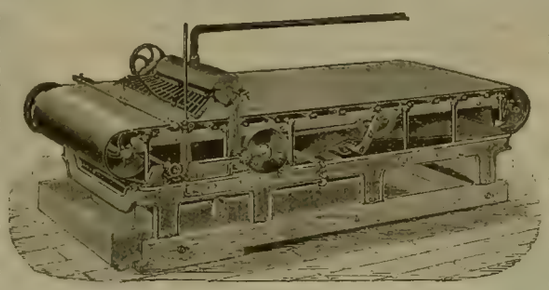
There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1887.

DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.



"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanner or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

One 3½x18 ft. Air Receiver.
The above are in first-class condition and will be sold cheap. For price apply to the PAYMASTER MINING CO., Yuma, Arizona Territory.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

B. E HENRIKSEN'S
PATENT
Automatic Safety Clutch
For ELEVATORS.

Simplest, Strongest & Most Reliable.

Constructed upon Scientific Principles.
Operates and Sets Automatically and Ever Ready for Service.

Entirely free from all springs, pawls, triggers, governors and other unreliable parts likely to stiffen, corrode or gum up.

ALWAYS IN FULL SIGHT, BUT NEVER REQUIRING ANY ATTENTION.

Has been practically tested in six actual elevator accidents and saved 51 persons from injuries and death.

SILVER MEDALS awarded by the Mechanics' Institute in 1880, 1882 and 1883. SEMI-CENTENNIAL GOLD MEDAL awarded by the American Institute of New York, Dec. 3, 1887. Apply to

Books on Working Ores.
BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ores without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 166 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco, Cal.

VALUABLE BOOKS

—FOR—

SHEET METAL WORKERS.

The Sheet Metal Worker's Instructor for Zinc, Sheet Iron, Copper and Tin Plate Workers, and others; Geometrical Problems; Practical and Simple Rules for describing the various Patterns. By Reuben H. Warn, Tin Plate Worker. With Boiler Making, Mensuration of Surfaces and Solids, Rules for Calculating the Weights of Different Figures of Iron and Steel, etc. Elaborately Illustrated. 8vo $3.00

A Practical Workshop Companion for Tin, Sheet Iron and Copper Plate Workers. Containing Rules for Describing various kinds of Patterns used by Tin, Sheet Iron and Copper Plate Workers; Practical Geometry; Mensuration of Surfaces and Solids; Tables of Areas and Circumferences of Circles; Japans, Varnishes, Lacquers, Cements, Compositions, etc. By Leroy J. Blinn. 160 illustrations. 12mo $2.50

Galvanized Iron Cornice Workers' Manual. Containing Instructions in laying out the different Miters, and making Patterns for all kinds of Plain and Circular Work. Also Tables of Weights, Areas and Circumferences of Circles. By Chas. A. Valle. Illustrated by 21 plates 4to $5.00

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

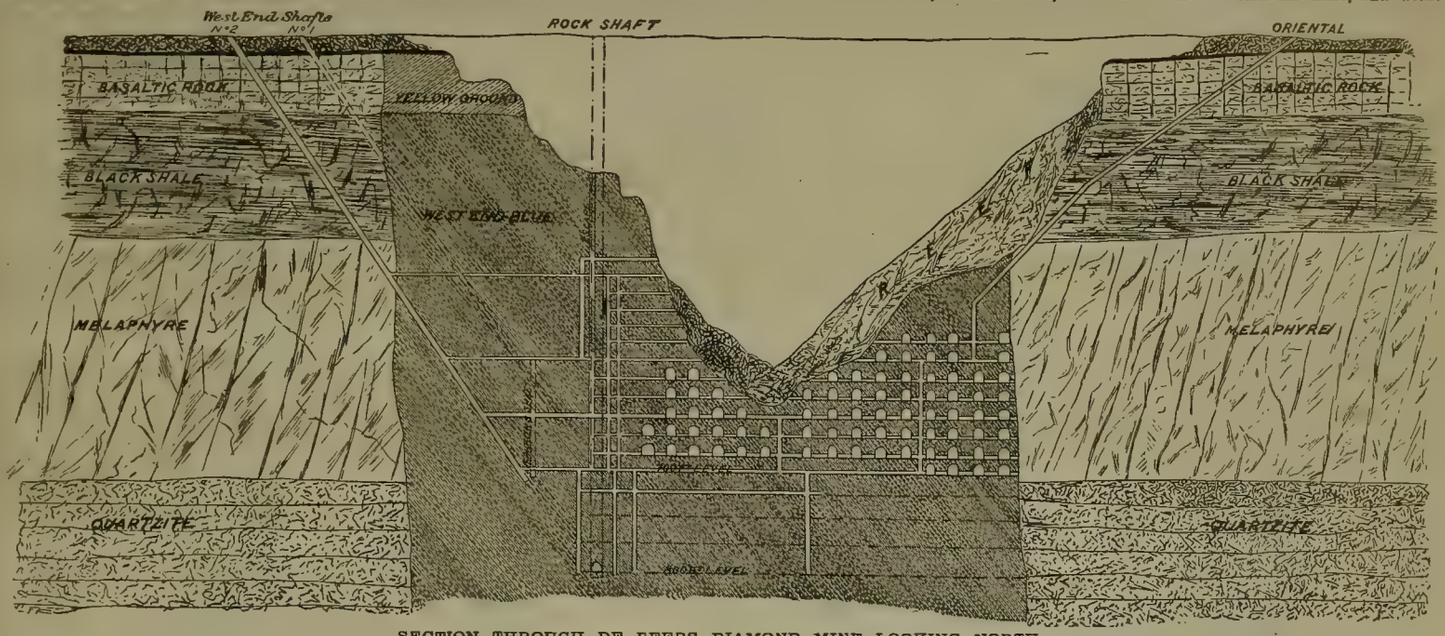
Diamond Mining.

The De Beers consolidated diamond mines, South Africa, made a profit last year of £448,000. The company have paid £5,300,000 for the Kimberley, another adjoining mine, and also own several other claims in the consolidation. They have about 12,000,000 loads of "blue" (diamondiferous earth) in two levels, and altogether have the very finest prospects.

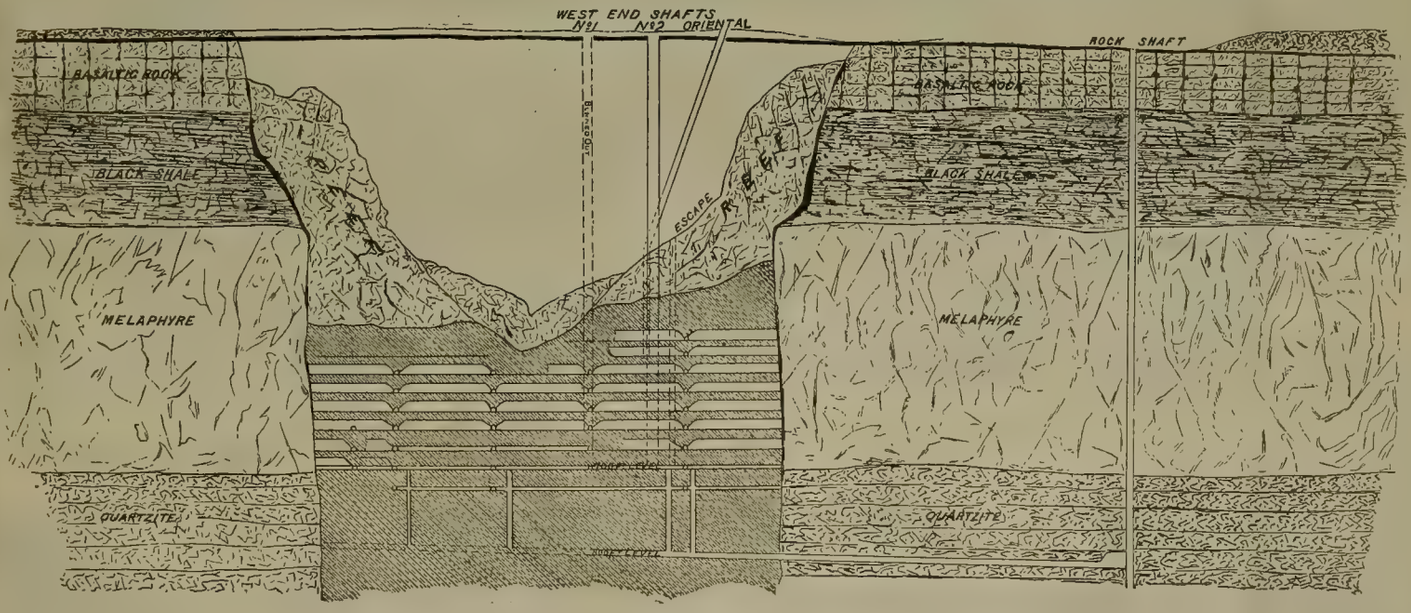
Mr. Gardner F. Williams, well known as an accomplished mining engineer of California, is in charge of these diamond mines as general manager, and is highly esteemed by the company as the right man in the right place. In his last annual report Mr. Williams describes the system of working the mine which he has inaugurated. Plans and sections of the mine are herewith given.

The plan of the 685 foot (or 700) level represents the present system of tunnels. The plan of the 800-foot level represents the system which Mr. Williams has laid out for the future working of the mine. By the latter system a considerable amount of tunneling will be saved and the tramming made less difficult.



Now that they have opened up levels below that portion of the mine formerly worked by the United and Victoria companies, and which had crushed in, they are able to work more systematically. The system which Mr. Williams has laid out is to work the levels back from the surrounding hard rock, in sections or levels 30 feet apart, forming, as it were, terraces, each upper level being worked back in advance of the one below it.

By this method there can be no danger of a general collapse of the underground works, as all the levels remain solid, with the exception of the tunnels. Only a few galleries at a time will be driven on each level, and the pillars between these will rest upon solid blue below. As they rob out the roof of the galleries and pillars other galleries will be excavated, and thus the work will be carried on until the blue ground on each level has been taken out. As the upper levels are being worked out, new ones will be started below.



The system of mining now being carried on in the De Beers mine can be continued to any reasonable depth without increasing the cost, except that of hoisting and pumping, which will naturally increase with depth. Many of the ablest mining engineers of Europe and America have visited the mine, and without exception have expressed opinions favorable to the system of work and the permanency of the mine.

The amount of "blue" hauled during the year was 225,658 loads through No. 1 incline, and 719,048 through No. 2 incline. They drove, among other work, 13,954 feet of main tunnels.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Yuba County.

Working Gravel By Drifting.

EDITORS PRESS:—'Tis but a few years since Yuba county was well and favorably known as a gold-producer, her rich gravel-banks and river-bars turning out over $35,000,000 of the yellow dust. Scarcely had the full measure of her prosperity been attained, when the anti-debris decision came down upon the hydraulic mines of this section and closed the entire enterprise. The miners who had paid Uncle Sam his price for mining lands, and backed their faith in the Government by investing thousands of dollars and years of toil in this speculative business, suddenly found themselves bankrupt, though owning millions. For a time they lived in and on the hope that in some way the matter would be adjusted and the mines be allowed to resume operations; but, as the months went by and the years came on without any measures of relief, they finally abandoned all hope of Government aid and settled down to a belief that gravel mining was doomed.

But man must live, be he a miner or rancher, and in time the "giant" was stored away as a relic of bygone (prosperous) days, and shafts put down to test the average character of the gravel. These showed that the first 60 feet above bedrock ran $2 50 to $30 a car. The cement gravel was crushed in batteries, but the result was not satisfactory, the rusty character of the gold preventing its free amalgamation. In consequence the miners felt that it was useless to battle against fate and endeavored to reconcile themselves to the inevitable. Then Wheaton Bros. and some Marysville people leased some mining ground on a royalty of 20 per cent and tried another process. The cement was crushed in a rock-breaker and then ground, polished and amalgamated in an arastra. By this old-time Mexican method the gravel was made to pay handsomely, though worked by shaft with all the attending expense. By reason of the steel-like character of the diorite bedrock it was found that a bedrock drift could not be run for less than $40 a foot; in consequence the drifts were run about eight feet above the bedrock and the gravel for 60 feet shaped out. About 80 miners are employed at $2.25 a day in supplying the arastras with gravel. When compared with the work of a hydraulic, the contrast is apparent at a glance.

Leaving out the section at Timbuctoo, the ridge at Smartsville is 1½ miles long, with a face of gravel 500 feet high and a thousand wide. On this bank the hydraulic could in one day do more work and produce a greater amount of gold than a thousand men, as the mines are worked at present. The present limited method is meeting with success, and in consequence Smartsville is taking on airs and looking "right smart" over the possibilities of the near future.

Mr. Ayer of Lowell is at this time visiting the section, which leads the miners to believe that they will soon resume operations on an extensive scale on the Excelsior. That this section can produce a large amount of gold for many years to come is evident. That which the hydraulic would have accomplished in a year may take a century to accomplish, and in this way many reap a benefit which with the hydraulic method would have gone to a few.

It is estimated that owing to the rusty and light gold of this deposit, the early miners did not realize over 60 per cent of the gold contents of the gravel. By the present arastra process the loss is almost nothing. Within another year the entire channel will be worked, and where but a few men were employed by the old hydraulic process, hundreds of miners will be needed to sink drift and timber in the mines as at present conducted. In consequence, Smartsville can look forward to a steady advance and a prosperous future.

E. H. SCHAEFFLE.

AN ONYX MINE.—Onyx mining is an industry about to be added to the already long list of the resources of this section. There is a very large ledge—a mountain of it—located about 20 miles northeast of Nipomo in the upper Huasna valley. It is the property of Kesseler Bros. of San Francisco, who are just commencing operations in the way of opening up and developing the mine. A contract for building a wagon-road to the mine has been let, and work will proceed on the same at once. The outlet will be at Arroyo Grande, to which point the stone will be hauled and shipped for San Francisco, to the works of Messrs. Kesseler Bros., for manufacturing into such articles as it is used for. It is said to be a very fine grade, and pieces large enough for mantels and table-tops can be sawed out. The mine is now opened in three different places, two showing white onyx and the other red. We are not advised as to the value of the stone from this particular mine, but the gentlemen handling the property are said to be experienced judges, and they consider it a big thing, owing to the immense quantity and accessibility of the mine. That they are preparing to ship in large lots and going to considerable expense, is sufficient to show that the enterprise is an important one and likely to yield good returns.—*Nipomo* (*San Luis Obispo Co.*) *News.*

The Irrigation Surveys.

Though the Senate Arid Lands Committee has made its flying circuit and is now presumably preparing its review of the situation to be presented at the opening of the next session of Congress, the actual surveys are now going on in Nevada, Utah and Idaho, and will ere long be prosecuted in the more westerly regions of the Pacific Coast. It is possible that some may have thought that the observations and bearings of the Flying Committee would constitute the data upon which these measures for the development of the country would proceed, and some have wondered how such cursory examination could yield any trustworthy conclusions. It is nat ural enough that such apprehensions should arise, and to allay them it is perhaps well to remark that the Visiting Committee only intended to get a few general ideas on the subject upon which they might recommend that the Government devote some of its surplus cash to a systematic investigation of the subject. No doubt they saw enough to warrant them in this and consequently it will not matter particularly if they did not see and hear all that the people wished to present to them. The work of the Flying Committee will serve its purpose, and the full and careful examination by Government experts will follow.

Some idea of the manner in which the work is being done can be obtained from statements made by ex-State Engineer Hall to a reporter of the *Chronicle*. Mr. Hall is supervising engineer of the arid land survey for the Western grand division, which includes the territory west of the Wasatch mountains, divided into five divisions, each in charge of a division engineer. He has just returned from a tour of inspection through the divisions of Nevada, Utah and Idaho, where he has better familiarized himself with the work done and planned and the progress made. In those divisions and in California surveying parties have been in the field for nearly three months. Mr. Hall gives this paragraph concerning the character of the work performed:

"There have been three surveying parties in the field in Nevada—one of five or six men, and part of the time two parties in Utah, and two parties of about 20 men in Idaho. In Utah investigations have been directed toward the study of irrigation as it is now practiced, the gauging of streams and sources of water supply. In Idaho the water supply has been studied on a large scale and preliminary surveys made for its distribution over the valley of the Snake river in the southern and southeastern part of the Territory. This valley is nearly 500 miles long and from 30 to 60 miles wide. All except the extreme upper portion is now an arid waste, but it has a salubrious climate, a fine soil, and irrigation would turn these great desert plains into a teeming country capable of supporting a great population. In the extreme upper end Mormon and other settlers have established small systems of irrigation, but the rest is practically all Government land, which has now been withdrawn from settlement. There are large and undetermined acres which have been covered by lava flows, but there are immense areas of fine soil with a topography favorable to irrigation, comprising probably from 5,000,000 to 7,000,000 acres, now worthless. This could not be redeemed except by the direct action of the Government or by the efforts of a great aggregation of capital. Altogether it is probably the best section of the country for the successful application of the arid lands law. The cost of irrigation works, though very large, would be small compared with the cost in similarly large sections and as compared with the value of the land redeemed."

This particular branch of the work, though large, is of course only part of the whole, but it gives an intimation of what the possibilities of increasing the productive area of the country are. It is a vast work, and, as Mr. Hall says, at the rate of progress made this year, the completion of the surveys would take several years, but of course a force could be put in the field which could complete the work next year. Some definite surveys have been made so far this year, and a preliminary study of the whole field, which will be a basis for intelligent future operations. The showing at the end of the season will be highly encouraging as a whole. Reports in some districts will be disappointing, but in some expectations will be exceeded. The wisdom and practicability of the law will be fully demonstrated.

The rapidity of the progress of this work depends upon the appropriations to be made by the coming Congress. Director Powell of the Geological Survey, who has general charge of the whole matter, will submit estimates of the cost of the work. He will also, we understand, include the examination of soils and waters to determine their fitness for production. This work should always attend the irrigation surveys, and was undoubtedly contemplated in the Act creating the Geological Survey, which provided that its duty should be the classification of the public lands.

This comprehensive and accurate work offers a field for the expenditure of a little of the surplus money now in the Government Treasury, and certainly no wiser use could be made of it. It is simply doing on a large scale what every land-owner does in his own business—that is, using the surplus profits from his good land to reclaim and make productive some waste part which needs improvement to become productive and yield a profit upon the investment in its amelioration. The great West should be a unit on this subject before Congress, for it holds the key of turning our so-called deserts into populous States; and the East should also earnestly approve it, for such improvements will give field for the investment of surplus Eastern capital and for the happy settlement beneath our own flag of the surplus Eastern population. We can conceive of no subject which now better merits generous treatment at the hands of the Government.

Underground in the Granite.

No mine of prominence in the country, says the Phillipsburg *Mail*, has received less mention regarding its underground workings than the mammoth Granite Mountain, which today stands second to none of the great properties in Montana. Through the kindness of Superintendent Weir a *Mail* representative was shown through the wonderful developments in this property during the past week, and to say, after a thorough cruise through its various levels, that the Granite mine is only in its infancy, is not a bold assertion. It is true, and all connected with it most certainly recognize this fact. The ore body is deposited in such a manner that it has proven itself to gain strength with depth. In the 5th level there was an enormous quantity of rich ore taken out, and at a distance of 500 feet in on this level the vein cropped out to the surface. The 6th level showed a still stronger ore body, and cropped out 200 feet farther east than the 5th. The 7th shows a decidedly stronger and richer body than in the levels above mentioned, and they have run east and west on the vein 2300 feet in solid ore. To a casual observer it would appear that there was enough ore in this level alone to supply the mills for years to come, although no ore is being taken from this level at present, but several men are at work in it, putting in chutes and preparing for future operations.

The principal supply for the mills is at present being taken from the 9th and 10th levels. The 9th level is making the best appearance of any yet run in the mine, the ore body being stronger and richer than any previously operated. They are only in a few hundred feet in this level, but from general indications it will prove the richest part of the mine yet explored. Quantities of native silver have already been taken out, and it seems to become more abundant as the work proceeds. Judging from the way the ore body is looking now it will hold out several hundred feet farther than any of the other levels.

The tenth level has been run both east and west many hundred feet, and there yet remains enormous bodies of ore to be mined from it. They have run westward on this vein until they have now almost reached the dividing-line between the Granite and Bi Metallic properties, and that the two companies are working on the same vein remains no longer a doubt. The eleventh and last level in the Granite mine, at a depth of nearly 1000 feet from the surface, has only recently been opened up, and they are now drifting north for the vein under the seventh level west, and it seems that when the vein is reached from this point they will have almost an endless body of ore.

Coming to the surface, the most noticeable improvements have been made within the past few months. The engine-room has been enlarged for the accommodation of the electric dynamo and engine; a new and commodious blacksmith shop has been erected, where they now manufacture their own cars, with the exception of the wheels, which are made at Bowen Bros. & Thompson's Phillipsburg foundry, and they can forge pieces of iron equal in size and otherwise to work of that kind done in St. Louis. A new cage is now being built to take the place of the old one in the shaft, which Mr. Weir does not consider as substantial as he desires it to be. The storeroom is another most attractive place on the grounds. Without seeing it, no one can imagine or scarcely be told what an enormous stock of supplies this company carries to replace any part of the vast machinery that may wear out or be damaged by accident.

Not even the gentlemen who are best acquainted with the Granite mine can conscientiously place an estimate on a term of its future existence, and 20 years would not be considered too long a time for them to work out what can safely be said to be in sight.

FLUMES REMOVED.—The double line of wooden flumes, formerly leading from the California pan-mill to the Omega mill in Sixmile canyon, to convey tailings flowing from the latter, has been removed. The Virginia *Chronicle* says: Each line of these flumes was nearly three miles in length, constructed of two-inch plank, and, with the posts and braces to hold them in place included, contained 500,000 feet of lumber. The tailings that flowed through those flumes into the Omega mill reservoirs contained many millions in bullion, and during the years when the high-grade ore from the first bonanza discovered in the California and Con. Virginia was being crushed at the Sacramento, Mariposa, California and Nevada stamp-mills, there was a continuous stream 20 inches in volume and six miles in length of tailings—fairly blue with the metal they contained—flowing through the two flumes.

Land Office Business for the Year.

It is telegraphed from Washington that the annual report of Acting Commissioner of the General Land Office William M. Stone has been submitted to the Secretary of the Interior. In opening his report Commissioner Stone refers to the accumulation of business in the office which has been left over from former administrations and which was partly due to the increasing work of local land offices. The system in force, he says, was not promotive of a speedy dispatch of business, especially in the case of the Board of Review, created by Commissioner Sparks, which he abolished as a hindrance to good, safe and quick work in the office. Commenting on Mr. Sparks' "unfortunate and unwarranted suspicions that a widespread system of frauds prevailed," and Mr. Sparks' assertion that "the proportion of fraudulent filings to the total number of filings made and relinquished may be estimated in round numbers at 100 per cent," Mr. Stone says: "This wholesale arraignment of claimants on the public domain should not have been made without the most conclusive evidence to sustain it." The report goes on to say that no general misconduct on the part of Western settlers has been found. During the year 1887, 147 agricultural patents were issued, covering 11,791,119 acres of land, an increase over the preceding year of more than 3,000,000 acres. Mineral patents to the number of 913, covering an acreage of 17,096, were issued. There were patented for the benefit of railroads, under the law, 425,046 acres, and under swamp land grants to States, 259,721 acres. State selections under educational grants were approved to the extent of 133,350 acres, and lands to Indians were patented under various Acts to the amount of $158,390.

The total cash receipts of the office from the sales of land and fees were $9,270,225, a decrease of more than $3,000,000 as compared with the previous year. During the year surveys were accepted to the amount of 4,544,372 acres, principally in Dakota, Montana and New Mexico. Commissioner Stone calls attention to certain allowances made to deputy surveyors by the first Comptroller of the Treasury in the years 1886 and 1887, which, in his opinion, was grossly irregular, and a palpable usurpation of the powers and duties specially belonging to the Commissioner of the General Land Office.

The report refers to the unsettled condition of private land claims in New Mexico and Arizona, and the urgent need of Congressional action to settle titles in these Territories.

Referring to the Act of March 3, 1887, which authorizes the Secretary of the Interior to adjust each of the railroad grants, and, if any have been erroneously certified or patented, to commence proceedings to cancel them, the report states that of pending selections 21,660,846 acres have been suspended, awaiting action by Congress.

Attention is called to the fact that more than 80,000,000 acres of land have been claimed under the Swamp Land Act in various States, Florida alone, while having a total area of but 37,031,520 acres, having lists filed for 22,221,469 acres as swamp land.

"There can be no doubt," says the report, "that large quantities of land, amounting to millions of acres, have been patented to States erroneously as swamp lands, when, in fact, they were and are good agricultural lands."

The work of examining ex-parte mineral entries is said to be two and a half years in arrears.

The report recommends that when a homestead or pre-emption claimant receives a patent and mineral is discovered subsequently on his claim, his certificate of entry shall act as a bar to any mining claim upon a discovery made subsequent to entry.

The report recommends the repeal of all laws relating to public timber and the enactment of a general law—plain, concise, and unmistakable in meaning.

Fewer fraudulent entries have been made during the year than for many years past, owing to increased vigilance, but several cases are mentioned in the report where syndicates sought to obtain coal lands by fraudulent means, and in one case, had they succeeded, the commission alone would have amounted to $550,000.

The opening of Oklahoma is referred to as the most important event for several years in the administration of the Land Office.

A MINERAL PALACE.—Following the idea of corn palaces and blue-grass palaces, the city of Pueblo, Colorado, is to have a mineral palace. The framework of the building, after the manner of the other structures named, will be concealed outside and inside with ores of all kinds, mineral specimens, coal, iron, steel and copper. The interior will represent tunnels, drafts, shafts, smelters, etc.

THE Rae metallurgic process of amalgamating ore pulp has been introduced into the Occidental mill. By this and the "Boss" process combined, 90 per cent of the assay value of ore pulp is saved at the California mill.

THE LOST BOOK OF EUCLID FOUND (?)—It is asserted that a Sanskrit translation of the lost book of Euclid has been discovered at Jeypore, India.

California Yachts.

The yachts built for California waters differ somewhat from those in Eastern waters, owing to our climatic conditions. Here we have very rough water and very strong winds during the summer yachting season. Our boats have to be built very "able;" that is, they cannot be shallow "skimming dishes" adapted only for light breezes and smooth waters. Our rigs are small, for we can only carry about two-thirds of the sail area given to Eastern yachts. The light sails and balloon canvas which make the Eastern yachts so picturesque are seldom used here, for we do not need them. In the channel of the bay when the wind comes sweeping in through the Golden Gate, it blows from 25 to 35 miles an hour nearly every afternoon in summer.

To stand such winds and attendant sea we give our California yachts a good depth and good beam. There are few keel yachts, most of them having center-boards, for the waters in the upper and lower bays are shallow. The largest yachts have lead keels, adapting them for ocean cruising. But there are few convenient harbors along the coast, so that most of the yachting is done in the bay.

The illustration on this page is a photo-facsimile of a large center-board schooner-yacht just starting across channel. It is a spirited picture, taken from a good position, and shows the type of craft most in use in these waters.

ON THE BAY OF SAN FRANCISCO.

SEMI-SUBTERRANEAN RIVERS.—We have in Nevada several rivers that sink and then rise again—as the Reese—and some that flow underground long distances after ceasing to flow on the surface. Arizona and New Mexico also have several such streams, but in some countries the rivers have a vegetable covering instead of one of earth or rock. Captain John Page of the Argentine Navy mentions that the Upper Paraguay, as if absolutely lost for many miles, has been known to flow beneath a matted covering of living and dead vegetation several feet in depth. In the year 1858 one of these growths, under the influence of an extraordinary inundation, broke loose and drifted 2000 miles, bringing up at Buenos Ayres, with many animals and reptiles that had taken refuge upon it.—*Virginia Enterprise.*

THE industry of making paper from cottonwood pulp is rapidly becoming one of the leading manufacturing interests of East Portland, the logs being rafted down the Willamette river to the mill.

THE asbestos deposit at Pigeon mountain, San Diego county, is difficult of access, being at the edge of the Colorado desert. The company operating this deposit also own the mine at Elsinore, the two deposits being very dissimilar in their character. That of the former is known as the long-fibered variety, and is used in the manufacture of roofing, pipe and boiler covering, etc., while the Elsinore product is a short-fiber article, possessing peculiar properties which make it valuable in working up into paint, readily combining with the pigments that form the component parts of this article of trade. Asbestos paint, a strictly fire-proof coating, is very extensively used, especially in the West; protracted drouths render all woodwork exceedingly dry and susceptible to fire. The company, of which J. D. Hoff is the manager, have a valuable plant at Pacific beach, where they are turning out large quantities of the paint.

FREDERICK M. JOHNSON of San Francisco, says the Rogue River *Courier*, has secured a franchise to supply Grants Pass, in Josephine county, Southern Oregon, with a fifty electric-light arc plant to light the town and supply the city with water for drinking purposes and power for machinery.

AS S. ALSOP & SONS were boring a 7-inch well on a lot belonging to D Coy in the southwestern suburbs of Salinas, they struck a vein of natural gas at a depth of 81 feet. The gas was ignited and has been burning with a rushing, roaring sound ever since, the flame extending eight or ten feet from the top of the pipe. In boring the well, the first ten feet was through adobe and sand; then 56 feet of blue slush; then 16 feet of dark-colored gritty clay; then 18 inches of gravel in which the gas was struck. The pressure must be quite strong, as the gas is forced through 60 feet of water and mud before it reaches the surface.

THE *Century* has in preparation a series of papers on topics relating to "The Gold-Hunters of California." The articles will be prepared for the most part, as were the war papers, by prominent participants in the events which they describe. A careful search in California and elsewhere has already brought to light many interesting pictures never yet engraved.

FIR TIMBER is looking up. The tests required by the Northern Pacific railroad prove it to be stronger than oak. Users of dimension timber may go farther and fare worse.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR.—*Ledger*, Oct. 5: At the Amador gold mine the west drift at the 550-foot level has struck the ledge. A strong flow of water was the immediate result, too much in fact for the small pump in the shaft to handle. They have suspended operations in this direction for a few days, when the water is expected to diminish. About 80 men, all told, are employed about the mine. W. T. Robinson has returned to Amador county to stay. He intends to devote himself to mining on the Mokelumne river. The engine shaft at the Zeile mine broke Sunday morning, and it took until Wednesday to repair it, nearly all the miners being laid off in the meantime.

DRYTOWN.—Amador *Dispatch*, Oct 5: Sinking at the Drytown Consolidated is making good headway, averaging about 10 feet per week. A ledge 18 feet thick is in the bottom of the shaft, and is getting wider as the shaft goes down. Cosmopolitan is running along in its usual quiet manner, making preparations to furnish rock to the mill when completed. The mill is getting along very slow, owing to the fact that there are only four mechanics at work. At the Reeves mine, lumber is being delivered for an additional 10 stamps.

Butte.

THE PERSHBAKER MINE.—Oroville *Mercury*, Oct. 5: On the 15th of last May papers in an action entitled Wm. Singer, Jr., vs. N. D. Rideout, A. Abbott and Albert M. Johnson, were filed in the office of the County Clerk in Oroville. The complaint set forth facts stating that plaintiff held a vendor's lien of $10,000 against the Pershbaker mine, of which defendants are owners. The suit hung fire until Sept. 28th, when it was finally dismissed by the filing of a "Precipe for Dismissal" on that date with the clerk. The opinion is expressed by men who are conversant with facts concerning the mine that this last move shows conclusively that misunderstandings between litigants have been settled, and that matters will soon be adjusted upon a working basis. One or two suits are still pending in our court against the mine claimants, and while they are important in themselves, are not considered sufficient to prevent resuming the gold search. The Pershbaker mine is rich in the precious metal, and if work is resumed again in the old claim, times will liven up on Magalia ridge.

Calaveras.

BRYANT.—Amador *Dispatch*, Oct. 5: Col. W. T. Robinson returned from San Francisco last Saturday night. He says he is now prepared to resume work on the Bryant mine, near Middle Bar, and thinks he will in a short time also resume work on the Cleveland mine. The Bryant mine is located just across the river in Calaveras county, while the Cleveland mine is on this side of the river. The Col. seems to be confident that both these mines will prove to be good paying pieces of property as soon as they can be thoroughly developed.

DRIFTING.—Angels *Record*, Oct. 2: Sam Wood has several men at work upon a claim a short distance from the Old Right Borrer mine at Indian creek. His aim is, if possible, to strike the pay chute on the west side of the old claim. A shaft has been sunk and the miners are drifting in hopes of making the discovery. If they find the original strata, and it keeps up to its standard for richness, we will no doubt be enabled to herald the discovery of an uncommonly rich mine.

Mariposa.

SCHROEDER MINE.—Mariposa *Gazette*, Oct. 5: Capt. Diltz is ardently engaged with the new road which he has planned to extend from his mine to the Merced river, at his mill-site, passing by the Buena Vista and Schroeder mines. The Captain has nearly completed the road as far as the Buena Vista. From that point to the Schroeder mine he proposes to make use largely of the road, such as it is, which Mr. Schroeder now uses. With some alterations and improvement in the grade and direction, avoiding the steep hills, the Captain expects to reach the Schroeder mine.

Mono.

GREEN CREEK DISTRICT.—Bridgeport *Chronicle-Union*, Oct. 2: The locators of mining claims on Green creek held a meeting agreeably with a posted notice, for the purpose of organizing a mining district. The district is bounded as follows: Commencing at a place on Virginia creek, Mono county, California, commonly known as the crossing of said creek, between Dogtown creek and the Old Mono Diggings, and running thence in a northwesterly direction to what is commonly known as the place where Tinkum's sawmill stood, on Robinson creek, below the Twin lakes; thence through the Twin lakes and up the channel of the Twin lakes creek to the summit of the Sierra Nevada mountains; thence in a southeasterly course along the summit of the mountains to a place near the headwaters of Virginia creek, where the Virginia creek trail crosses the said summit; thence in an easterly course along said trail to the middle of the waters of said Virginia creek, and thence down the middle of the channel of said creek to the place of beginning. A large number of locations have been made, and all who have visited the district believe there is a bright future for it at no distant day. Very good ores, assaying into the hundreds, are daily brought to town, or sent to the assayer at Bodie, and the district is attracting attention.

Napa.

THE KENTUCK MINE. — *Calistogian*, Oct. 2: Lumber, supplies, etc., for use at the Kentuck quicksilver mine in Cinnabar district, the coming winter, are being taken there from Calistoga. The company has finally decided upon a course to pursue in reopening the mine. First, excavations were made in the old tunnel, but it was found to be too badly caved and work was stopped. Then a new incline was started at the side of the old one, but work was discontinued there and the old incline was reopened several feet—down to where plenty of cinnabar was in sight, but the incline caved badly and it also has been abandoned. Last week work was commenced on a shaft through which the mine will be opened and worked. It will be continued down to where the ore is now known to be, a distance of 65 feet. A furnace—contrary to the old methods employed at quicksilver claims years ago—will not be constructed at the mine until the owners know more about the amount of cinnabar that can be obtained there. But to assist in defraying the expenses of development, two retorts will be taken to the mine and kept in operation. About one and a quarter tons of ore can be run through the two in 24 hours, and the product will amount to a fair sum monthly, as the ore shows itself to be of very high grade.

Nevada.

MINING AN OLD MILLSITE.—*Transcript*, Oct. 3: Charles Adolph and Will Hart, who recently made $210 apiece in seven days working over the ground where Keith's custom quartz-mill used to stand, have obtained the privilege of working the site occupied by the Deadwood ten-stamp mill in Willow valley up to the time the building was burned down last year. The mill was constructed in 1856, and had been pounding away on quartz a good share of the time it was in existence. There is of course reason to believe that more or less gold was lost from the batteries, and Adolph and his partner will be disappointed if they do not recover a lot of it.

STRUCK THE BLUE LEAD.—At the San Jose mine near the Central House between this city and Washington, the long-sought-for blue gravel lead was struck on Tuesday last. There can be no mistake about it, according to Mr. Spencer, president of the company, who came down Thursday from the mine. The gravel is rich in coarse gold. Tens of thousands of dollars in money and several years of hard labor have been expended in prospecting the claim. The discovery will make a boom in gravel mining up there. It is in the same neighborhood as the Centennial claim, which is being prospected by State of Nevada men.

WILL RUN THE TUNNEL.—It has been decided as a result of the visit that President James, Supt. Richards and Wm. Davis paid this week to the Centennial drift mine between here and Washington, to run a prospecting tunnel into the ridge, beginning at a point near the Nevada City and Washington road, and about a mile southwest of the present hoisting works. Work will begin without delay.

WASHINGTON DISTRICT.—Cor. Nevada *Transcript:* Washington is a lively burg. Many men pass through it up and down, to and from the mines on the river above. The mines are well worth seeing, if but to show in what a forbidding-looking country good gold-bearing quartz may be found. The Diamond D — formerly the Eagle Bird—has many men now working on top, busy cutting out lumber, carrying it over a mile on their shoulders and using it in the repair of their flume, which hangs like an air line, seemingly across the face of the winding cliffs. The sills are being doubled by alternating every old sill with a new one. To do the work, carpenters must hang suspended in slings mid-air. Farther up the Meadow Lake ledges and their intractable ores are being experimented on from time to time. This part of the county now offers great inducements to prospectors. Some veins that were almost barren on the croppings have turned out handsomely on the dip. For example, the Yuba mine betters itself as it goes down.

Placer.

REVIVAL AT OPHIR.—Placer *Herald*, Oct. 5: The mining situation in the Ophir district is improving daily. Residents say the prospect has not been so encouraging for years, and predict lively times in the old camp. The district has been from the early days noted for its rich quartz mines. The chief reason why capitalists have been shy of investing there for the last ten years or more has been the lack of confidence, begotten of former failures. During the last year confidence has been gradually growing through the successful working of the Hathaway mine by the Valentines, the success of Charlie Reed in the St. Lawrence, the continued good pay in the Moore mine belonging to the White boys, and the late rich strike of A. Shurtleff in the Crater. Mr. Shurtleff has taken out $500 rock, but no excitement followed and nobody seemed much surprised simply because it was in Ophir, where the same thing had happened scores of times before. The Crater is an old mine. It has just the same history that neighboring mines have. It has been abandoned time and again, and now Mr. Shurtleff has taken hold of it and has found richer rock than its former owners ever dreamed it possessed. The Bellevue is another mine that has a history similar to that of the Crater. It is one of the oldest mines, having been located in 1855 and known at that time as the Union Co. mine. W. Pellow has owned the mine for quite a number of years and has taken out considerable money at times. During this last winter he bonded it to J. McCaw and N. Curtis, experienced and practical miners. Mr. McCaw began work in May by sinking a shaft. They have since sunk four other shafts 70 feet in depth. The work of cleaning out the old slope has been under way for several weeks. Everything has been made secure to the water level. This slope is 280 feet deep and is filled with water to within 70 feet of the surface. They are preparing to hoist. The boiler is in position, and a pump with a capacity of 6000 gallons an hour is on the ground. The hoisting works will be in working order by next Monday. Charley Reed is quietly working away in the St. Lawrence. This is another old mine. He came into ownership in 1886. Since then he has sunk five shafts besides starting two tunnels, the second being the working tunnel and is 350 feet in length. This tunnel follows a stringer in the footwall for a distance of 160 feet to a point where another stringer came in from the northeast. These two stringers continue, the one above the other, to the end of the tunnel. They are gradually approaching each other and probably will become one a few feet ahead, judging from the indications. These stringers or ledges are from eight inches to a foot in thickness, and at the head of the tunnel are separated by a layer of syenite a foot in thickness. Mr. Reed has now uncovered and ready for taking up an area about 40 feet square of the lower ledge which reaches in a solid sheet down to the floor of the tunnel, and is inclined at an angle of about 33 degrees. He will soon begin to take it up and will follow the ledge to the surface, which is about 175 feet above. He is now working the upper ledge. The quartz is arranged in layers and is known as "ribbon" rock. For the last 160 feet the lower ledge has been very rich, the assorted rock paying $200 per ton and the common rock yielding from $20 to $25 per ton. The ore is hard and contains iron and galena sulphurets. These sulphurets are sent to the Oakland smelting works. He will build a mill at the mouth of the tunnel and thus save the cost of hauling.

RICH GRAVEL.—Placer *Republican*, Oct. 3: The May Flower miners have found both the north and south veins of the Orono channel, which shows that it comes in from the east. The gravel is proving very rich. A trial crushing of 64 tons just made resulted in $7.62 a ton.

Plumas.

WEST ELIZABETH MINE.—Greenville *Bulletin*, Oct. 2: From Mr. Kerr, once a resident of this place, who, with Mr. Miller, was here from Johnsville last Saturday, we learn that the West Elizabeth M. Co. is developing a very important property about six miles from Johnsville, between Poplar and Nelson creeks. The work on this property under the quiet but able superintendency of Mr. W. J. White, has been prosecuted for the past four years. First at an elevation of over 6000 feet, a tunnel 625 feet long was run. Striking sediment and pipe clay in this, a second tunnel was begun, 150 feet lower down. This has been run into the ridge 1250 feet. A few days ago, a raise of 47 feet was completed, tapping a large ancient channel. Mr. Miller says he is yet on the rim, the bed being five feet lower than at the point where the channel was tapped. The gravel yields good pay, and the gold shown us indicates that the mine will yield $20 to the car of gravel. The face of the tunnel is under a lava cap about 400 feet thick. The company owns four claims, which cover between three and four miles of the channel which can be successfully opened at three points. It makes a large proposition, and one that will doubtless yield large profits to the owners, if they go ahead and open up the property as it should be. It is claimed that this development opens up a new field of mining in that locality. It has been asserted that such channels do not exist at an elevation of 6000 feet, but this development proves to the contrary. Doubtless this ancient riverbed will be traced many miles, and numerous good gravel mines developed on its line. The work done thus far has been very successfully directed by Mr. Miller, and it is of a very substantial character. He is the right man in the right place.

Sierra.

WIDE AWAKE. — *Mountain Messenger*, Oct. 5: Wm. and Fred Bosch were in from the Wide Awake mine last Monday and report the new tunnel in 380 feet, and that 200 feet more will end the contract. It is expected that the company will then be in pay gravel.

LOGANVILLE.—H. P. Parker, from Loganville, reports the water all out of the mine down to the 400-foot level, and will begin taking out ore in a few days, no mishap preventing.

GRAVEL.—Sandy Kenn has sunk a shaft back of his house and is taking out gravel. There seems to be a large body of gravel that is expected to pay well for working. It was about 30 feet to bedrock. He is now drifting in new ground and ought to get considerable gold, as the ground under the town paid well in early days.

SIERRA CITY.—The rock taken from the Chipps mine to the Marguerite mill is panning out well. The Buttes Saddle Back Co. is still packing rock to the Kentucky mill. They are giving the mill a good overhauling. The Buttes mine has closed down all below No. 3.

Shasta.

OLD DIGGINGS DISTRICT.—Redding *Free Press*, Oct. 5: R. G. Hart and R. G. Hart Jr. have returned from Sacramento and are again conducting the destinies of the Texas mine, which is developing into a valuable piece of property. There are now three quartz-mills running in the Old Diggings, which is more than ever before. Developments of a startling nature may be expected soon—discoveries that will astonish the natives. Walker Bros.' new mill is about complete, and will soon be in operation. It is one of the finest mills on the Pacific Coast. The rock-breaker is a 9x15 Blake, 150 tons capacity in 24 hours, and is run by a special engine.

SOLD.—Redding *Free Press*, Oct. 5: It is reported that two young men recently sold a mine near Delta for $15,000. Dr. Walk has a location near the one sold from which he expects great things.

OAK RUN.—Wm. Morley sent us some quartz from Oak Run this week that contains free gold. He has no doubt a valuable mine.

SILVER.—We saw ten bricks of silver bullion, valued at $7000, piled up on the sidewalk in front of the Bank of Shasta County Thursday, the product of the silver mine on Iron mountain. Another lot will come in on Monday, when it will all be shipped to S. F.

NEW RIVER.—All the mines in New River, save the Ridgeway, have shut down for the winter. The Ridgeway is owned by a Co. which is able to prosecute work under the disadvantages imposed by winter, if necessary, and is perhaps the only Co. in the district so equipped. Most of the other companies are working leased properties.

OLD DIGGINGS.—Frank Panter, Lawrence Garrecht and Young, owners of the Mammoth mine at Old Diggings, are a happy trio. Tuesday night, after letting off a blast, they picked up chunks of quartz glistening with free gold—very rich. The ledge is five feet wide and 275 feet under ground. This mine is located near the Central, and the discovery will greatly add to the value of both properties.

COAL.—H. H. Briggs of Redding has located a promising coal mine between Clover and Dry Clover creeks, and has bought 160 acres of land, on which the mine is located, from Mrs. Webb of Millville at $4.50 per acre. A. W. Norton of the Napa tannery is interested with him, and Fred H. Deakin and E. Frisbie have a location near by. Briggs has partially developed his ledge, and experts claim that the coal will make 80 per cent gas.

GOLD.—J. W. Armstrong has made a curious yet valuable discovery of mineral-bearing rock near the mouth of Sulphur creek, near Reid's ferry. At this place a precipitous hill juts out which can plainly be seen from Redding. Mr. Armstrong was descending from the hill not many days ago when he slipped, and to save himself from falling he caught hold of a ledge of rock, which giving way so easily excited his suspicion, and looking at the piece remaining in his hand, he discovered that it was well sprinkled with gold. An assay was made which went as high as $80 to the ton. Armstrong, B. Jones and a gentleman named Jennings are interested in the find, and the Ottawa Reduction Works have on hand two wagon-loads which they will test. The rock, if rock it be, is very rotten in character, and does not in any way resemble gold-bearing quartz.

NEW MILL.—Shasta *Democrat*, Oct. 2: The Walker Bros.' new mill on the river opposite Copley will start up this week. It is said to be one of the best milling plants in the county. Harrison Fox and son have struck a rich prospect near French Gulch. The Trinity *Journal* says the new find bids fair to develop into a good property.

NORTH STAR.—Considerable machinery has been shipped from here lately for the North Star mill, which is to be erected by the North Star Mining Co. on East Fork, Trinity county. Frank Young and partner, of the Mammoth mine, Old Diggings, are driving ahead with their lower tunnel which is in 16 feet of ore. In its present stage of development there is an immense body of ore in sight. A half dozen or more mining men, representing foreign capital, have been in and out of Redding the past week or ten days, all of whom seem to take considerable interest in the mines of this county.

Tuolumne.

A RICH MINE.—Tuolumne *Independent*, Oct. 5: If rumor is correct, and we have no reason to doubt it in this case, Messrs. Frank McCann and John Summers have struck a very rich mine. The mine is situated above Summersville, and what was once a 20-inch vein has developed until it now measures from five to seven feet, the rock of which shows free gold and plenty of it.

SUMMERSVILLE ITEMS.—The New Albany mine, formerly owned by Dr. Walker of Sonora, has been sold to a San Francisco company for the rumored sum of $30,000. Mr. W. G. Whorf is superintendent, and Mr. Whitto of Sonora is foreman. Under their supervision a full force of men is pushing the work forward with great diligence, and everything has entered on a flourishing condition. In connection with the mine, the company is making extensive preparations for a new boarding-house, sleeping apartments, etc. Messrs. Long and Gibbs have taken their departure for the Pinenut mine, situated on Turnback creek.

NEW ALBANY.—*Union Democrat*, Oct. 5: The new owners of the New Albany mine have gone into possession and are making arrangements to work it on a large scale—such as the well-established character of the mine deserves. We understand that the purchasers are ex-Gov. Perkins, Capt. McDonald and Millen Griffith of San Francisco. It is in charge of Mr. Whorf as supt. The present condition of the mine is most satisfactory and justifies the firm opinion always held as to its merits by its late owner, Dr. John Walker. The vein on the chute in the north end of the mine is some 15 feet in width and of high-grade ore.

HYDE.—Heavy pumping steam machinery is now being put on this mine by the new owners who lately purchased the property. The main working shaft is to be carried down and the mine prospected by levels. The machinery has capacity for 1000 feet in depth.

KANAKA.—This mine, near Groveland, has been sold to New York parties. It was brought to their attention and reported on by Mr. Louis Blanding. There are several mines in the county now under inspection for purchase, and the indications are that they will all be taken by strong parties and active operations soon started on them.

NEVADA.

Washoe District.

UTAH.—Virginia *Chronicle*, Oct. 5: During the week extracted and milled 320 tons of ore showing an average assay value of $17.20 per ton. Bullion valued at $6172 shipped to Carson Mint. Concentrates on hand valued at $7000.

NORTH OCCIDENTAL. — Continue stoping ore from the 450 level.

SIERRA NEVADA.—On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 229 feet. Formation, porphyry with some water.

UNION CON.—On the 1465 level the north lateral drift is advanced 471 feet from the south line, continuing in porphyry and clay.

MEXICAN.—On the 1465 level the north drift from west crosscut No. 1, 200 feet in from the lateral drift, is advanced 444 feet, continuing in porphyry and lines of quartz with some water.

OPHIR.—On the 1300 level the east crosscut from the shaft station, to connect with the top of the raise above the 1465 level east drift, is extended 172 feet, face continuing in porphyry showing streaks and lines of quartz.

CON. CAL. & VA.—The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650 and 1950 levels. Continue to stope ore of good quality from the point of connection between the northeast drift from the top of upraise No. 2 above the 1600 level. On the 1600 level continue to extract ore from ground bordering the south drift from the Ophir line on the sill floor. On the 1650 level: The stopes on the 7th and 11th floors above this level continue to yield the usual quantity of ore of fair quality. During the week 1085 tons and 250 pounds of ore were shipped to the Morgan mill, 1314 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $26.50. Shipped during the week bullion valued at $59,582.85 to the Carson Mint. Bullion valued at $111,111.57 shipped to San Francisco.

BEST & BELCHER.—On the 550 level, west crosscut No. 1 is extended 37 feet. Formation, porphyry and clay with streaks of quartz. On the 1000 level the northwest drift is extended 305 feet. Formation, porphyry.

GOULD & CURRY.—On the 300 level all work during the past week has been on repairs. On the 400 level west crosscut No. 1 is extended 370 feet. Formation, soft porphyry with streaks of quartz.

EAST SIERRA NEVADA.—The 520 level south drift is out 90 feet and continues in porphyry.

ANDES.—Quartz is still showing in 350 level explorations.

SCORPION.—The 520 level south drift is showing porphyry and quartz.

SAVAGE.—Continue to extract ore of good quality from the 500 level. The south drift from the Gould and Curry to connect with the Savage north drift is advanced 60 feet.

HALE & NORCROSS.—West crosscut No. 1 on the 300 level has entered vein porphyry. No. 3 continues in hard quartz assaying from $7 to $10 per ton. Driving south on the 1200 level.

NORTH GOULD & CURRY AND EAST BEST &

BELCHER.—The northwest drift to connect with the North Gould & Curry workings is out 35 feet, and yesterday entered fine-looking quartz.

POTOSI.—The 850 level south drift has entered a hard porphyritic formation.

IMPERIAL.—An east drift from the winze bottom below the 300 level to connect with the Imperial shaft is out 50 feet. The west crosscut continues in low-grade quartz.

ALPHA.—The 500 level west crosscut shows seams of low-grade quartz. The shaft is down 70 feet below the 500 level.

CONFIDENCE AND CHALLENGE.—The joint Imperial 500 level west drift is out 690 feet from the Yellow Jacket shaft.

YELLOW JACKET.—The 500 level west drift is out 690 feet. Daily ore shipments average 50 tons.

OVERMAN.—The south drift from the winze bottom is out 65 feet, the face in clay and quartz carrying fair-grade ore. The incline raise is up 85 feet and continues to show quartz and porphyry in the top.

CROWN POINT.—The 700 level south drift is out 275 feet, the face in porphyry. Drifting north from the 600 level east drift. Cleaning out the winze below the 900 level north drift. The 1000 level southeast drift is opened 225 feet.

BELCHER.—No. 1 east crosscut from the winze bottom on the 1200 level continues in low-grade quartz. The 200 level west crosscut continues in porphyry and clay. The 1000 level west crosscut is in low-grade quartz.

SEG. BELCHER.—The 1100 level east crosscut is in 290 feet, and is still in low-grade quartz.

SILVER HILL.—The 160 level northeast crosscut has entered quartz and porphyry.

CALEDONIA.—West crosscut No. 2 is in 32 feet, and continues in porphyry.

JUSTICE.—Crushed 224 tons of ore assaying about $26.18 per ton. Stopes looking well.

ALTA.—Crushed 319 tons of ore, assays showing a value of $29 per ton.

NEW YORK CON.—The raise above the 800 level west crosscut continues in ore.

Columbus District.

A POSSIBLE REVIVAL.—Inyo *Independent*, Oct. 5: There is good prospect for a big revival of business at Candelaria. The English Co. which own the water works and a 30-stamp mill, are negotiating for the purchase of the Holmes mining property. There is strong probability that the sale will be made, and if it is the camp will boom again. Candelaria is far from being a dull camp; as it is, about 170 miners are now employed there, and that means a good deal of business.

Osceola District.

THE PLACERS.—Cor. Nevada *Transcript*, Oct. 4: Osceola is in the eastern part of White Pine county, Nevada, and situated on the western slope of a range of mountains which divide Snake river from Spring Valley, fronting on Spring Valley, and at an elevation of 1200 feet above the bed of the valley. The Osceola gravel mine is situated about one mile below the town. It empties into Spring Valley and dumps at an elevation of about 300 feet above the valley level. The owners of the mine have been fortunately foreseeing enough to have entered and obtained a patent for a large extent of this valley as desert land, for dumping purposes. The mine is worked by the hydraulic process under superintendency of J. H. Marriott, a native of Nevada City. It is indeed a valuable piece of property, as the gold is certainly here, and the owners are on the eve of reaping a good harvest. Our monitor is one of Hoskins' 15-inch, with a seven-inch nozzle in use, owing to the scarcity of water. Up to the present time they have had only about 500 inches of running water in the best time of the season, but by the aid of a reservoir they manage to have a stream for the monitor, at this date, for about two hours each day. The ground is very rocky and was evidently an old river channel. The gold is coarse and of fine quality. The company are now employing about 40 men in constructing a ditch which they confidently expect will furnish some 2000 inches of water during the general water season, and sufficient to keep the mine running from nine to ten months in the year. The ditch will be about 16 miles long, four feet on the bottom, six and one-half feet on top, and two and one-half feet deep. There will be about five miles of flume. The ditch and flume will vary in grade from 16 to 30 feet to the mile, as the very rough country over which it passes may necessitate. Some three miles of the ditch are completed. The flume will be of a very substantial character—about the same as the flume of the Milton company's ditch.

Pioche District.

ANOTHER STRIKE.—Pioche *Record*, Oct. 2: On Thursday the Black ledge was struck on the tenth level of the Raymond & Ely mine, at a point about 1000 feet from the shaft. When the Black ledge was entered on the twelfth level, as reported two weeks ago, its strike was noted, and a drift was immediately started on the tenth level, at the crosshead, which it was estimated would cut the ledge after running about 40 feet. Half that distance only was run when the ledge was found. The dimensions of the ledge at this point are not yet determined. A good quality of ore was taken out which can be easily smelted after roasting.

Safford District.

WORK RESUMED. — Eureka *Sentinel*, Oct. 5: Work is being resumed in Safford mining district near Palisade. A carload of machinery for hoisting works for the Onondaga mine in that district was received a few days ago.

Tuscarora District.

NAVAJO.—*Times-Review*, Oct. 5: The crosscut on the 350-foot level extended 12 feet; total length, 121 feet. The upraise, south end of the 350-foot level, extended 8 feet.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 16 feet; the face continues without material change. Main south drift, 100-foot level, extended 15 feet; total length, 195 feet.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 14 feet; total depth below the 400-foot level, 135 feet. The bottom is in very hard black porphyry. Water flow about the same.

BELLE ISLE.—North drift, 250-foot level, has been extended 5 feet; total length, 100 feet. Work at that point has been suspended for the present. The main west crosscut has been started up and advanced 5 feet.

DEL MONTE.—West crosscut No. 2, 100-foot level, extended 12 feet in vein; total, 20 feet. Opposite this crosscut, No. 2 east crosscut has been started; the face shows high-grade ore.

GRAND PRIZE.—The 500-foot level and station is being retimbered where necessary, and being put in shape generally. Mine boilers are now undergoing repairs. Development work will be started during the coming week on the 400 and 500 foot levels. Water is below the last-mentioned level, and being held there easily. Work on the concentrator is progressing favorably.

COMMONWEALTH.—An upraise has been made near the face of the north drift, 100-foot level, 225 feet north of shaft, exposing high-grade ore. East crosscut from north drift is in 17 feet, showing fine ore the entire distance. South drift from No. 15 chute has been advanced 10 feet, following good ore.

Union District.

THE ARIZONA MINE.—*Silver State*, Oct. 5: Reports from Unionville are to the effect that a 10-inch streak of black sulphuret of silver has been cut in the Arizona works on the south side of the mountain. Black sulphuret ore predominated in the Arizona in its palmy days, and there is no known reason why the mine should not come to the front again.

Wild Rose District.

CONCENTRATED ORE.—*Silver State* Oct. 7: The Paradise Valley Co.'s team arrived yesterday with 18,000 pounds of concentrated ore. The mill is now running day and night on ore that assays between $50 and $60 per ton from the battery.

Winnemucca District.

STRUCK SULPHURET ORE.—*Silver State*, Oct. 7: A small vein of sulphuret ore, which assays over $20 per ton, has been cut in the tunnel of the Winnemucca Mining Co., and the prospects for striking a larger vein are said to be excellent. Three veins which carry carbonate and chloride ores have been cut in the mine.

ARIZONA.

BLACK HORSE.—Arizona *Journal-Miner*, Oct. 3: Among the bullion-producing mines, or mines from which lots of good shipping ore has been taken, but about which very little has been said, is the Black Horse mine, in Hassayampa district, owned by W. T. Richardson and Charles Wallace. The property is opened up by three shafts, the main one of which is down to a depth of 70 feet. Another one has been sunk 20 feet, and a third 30 feet, all being on the ledge and in good ore. A 10-ton lot of the ore, worked at Cartmell's mill on Groom creek, a few years ago, netted the owners $1052, although the arrangements for saving the precious metal to any high percentage were very imperfect. The last ore taken from the mine was shipped to Pueblo, Col., for treatment and gave a return of $253 per ton. The ore that has been taken from the mine has more than paid for the development work done, and all the stoping that has been done is a block 28 feet in length by 20 feet high. The mine is located in a forest of pine trees, so that wood, as well as water, is in abundance right at the property. There is also in connection with it a good five-room house, shop, etc., in the way of improvements.

GOLD.—Prescott *Courier*, Oct. 2: Ed. I. Johnson and H. Waterman have lots of gold in a ledge, situated between Walnut Grove and Weaver. They took out nuggets worth $75 in a short time and had a sack full of free gold ore, worth in the neighborhood of $500. Silver King shaft, Groom creek district, is about 96 feet deep; ledge, 2½ feet thick; ore increasing in richness. This mine belongs to the Kansas City M. & M. Co. The president, Mr. Smith, will return here to-morrow. Col. Boaz selected this mine for the company. The Waco mine, Walker district, will now be worked by two shifts of miners. It is close to the Dixie mill. John S. Jones said, yesterday, that he would shortly start the Standard mill, Groom Creek. Jacob Henkle, owner of the Rapid Transit mine, Bradshaw district, has a 400-foot tunnel in that fine vein and intends to make it 800 feet before quitting. News of Johnson & Waterman's strike created quite a stir at Walnut Grove and Weaver.

COLORADO.

ASPEN.—Cor. Denver *Republican*, Oct. 3: The snow was enthusiastically welcomed by a great many people who firmly believe that it is a forerunner of increased mining activity. Aspen has certainly earned the reputation that it bears of being a "winter camp." It has taken all of its great forward steps during the winter months, and the winter that is now coming on promises to be more remarkable in this respect than any that have gone before. There are signs of great developments during the next few months, and the greatest confidence exists on all sides. Tourtelotte park has been improving very rapidly during the past few weeks. A well-known mining man stated to your correspondent that it is his belief that the park will produce more ore during the month of November than during any month of its past history. The two leases on the Camp Bird have before been spoken of. There is some disappointment about the grade of the ore found in the north-end lease, but it is looking well and the lessees seem to be satisfied with the outlook. The lessees on the south end are jubilant. A 300-ton lot is being delivered at the sampler, and it is believed that it will run over 70 ounces per ton. The Blazing Star, in the southwestern part of the park, has struck two feet of very good ore. The ore was found at a depth of 337 feet. Assays ran from 44 to 231 ounces, an average sample returning 68 ounces. The Mary and Edith, another Tourtelotte property, has opened pay ore. The contact was reached in this mine at a depth of 220 feet, but the mineral first found was of too low a grade to handle. A drift 35 feet long to the southeast has developed a two-foot streak of mineral running from 70 to 110 ounces, there being four feet of 20-ounce ore in connection with it. This property is principally owned by Denver parties, M. J. McNamara and J. E. Bates being heavily interested. Richmond hill is attracting much attention. The discovery in the Little Annie has before been spoken of. The first lot of ore shipped from it was pretty carefully selected. It returned 75 ounces per ton. This was so good that the lessees tried shipping the whole product of the ore streak, some five feet thick. It was not supposed that this would go over 30 ounces, but the return on the five-ton lot was 51.2 ounces. This demonstrates that the mine is paying beyond all doubt. The ore cannot be economically mined through the present works, and the shipments will be small until the west shaft is driven down to the contact. The J. C. Johnson, in which two new rich ore bodies were recently discovered, has opened still another. This is in the fourth level. A 100-ton lot from the latest find has been sent to the sampler. It is expected to return considerably more than 100 ounces per ton.

BRITISH COLUMBIA.

THE CARIBOO MINES. — Kamloops *Sentinel*, Oct. 2: Dr. T. J. Jones visited all the mines in the section during his recent visit to Cariboo, but gave more particular attention to the Island Mountain and B. C. Co.'s property. The Island Mountain was first visited; in it there are four tunnels. The lower one is now 200 feet in the ledge, and averaging three feet in width, and all well mineralized ore. There is now on the dump, at a low estimate, 600 tons. The next tunnel, Johns tunnel it is called, is now in 211 feet, and averages 5 feet in width. On the dump there is 1000 tons of good ore. The Enterprise tunnel is in 420 feet, the ledge being about six feet in width. This tunnel is within about 800 feet of the Johns. All operations on the Island Mountain are at present suspended, although there are over 2000 tons of good ore on the dump and the oxidized ore to be found there would alone be sufficient to pay all running expenses and leave a profit besides. Besides the ore on the dump, there is enough in sight to last a year. If put in running order, the mill—a ten-stamp one, with four concentrators, a large crusher and all the most modern machinery—would realize a profit of $100 a day. The Graphite is another very promising ledge, also owned by the Island Mountain Co. The Graphite is seven feet wide on the face, and the tunnel is in 64 feet. There is about 180 tons of ore on the dump, and the operations here also are for the time being suspended.

DAKOTA.

CARBONATE.—Deadwood *Pioneer*, Oct. 3: A force of men is employed on the Lardner water-ditch that supplies the Caledonia mill with water. They are repairing the large dam on Upper False Bottom creek, and are going to erect another bed-rock dam at the forks of False Bottom creek and put in a powerful steam pump to elevate the water into the ditch. This will insure a large supply of water even in the driest season. Several men are at work sinking a shaft on the Little Iron lode adjoining the Spanish R property. They are now down between 40 and 50 feet. Work goes steadily forward in the Albe mine, adjacent to the Iron Hill. Drifting from the bottom of the shaft will commence in a few days. This mine has shipped several cars of rich ore at different times and has good prospects. The Seabury-Calkins Consolidated Mining Co. on yesterday finished the shipment of six cars of ore to the Kansas City smelter. This ore averaged about $60 per ton in gold and $5 in silver. There is considerable more high-grade ore ready for shipment. The Spanish R Co. continues shipping ore to Kansas City, averaging about three carloads of ore per week. Work is now going on in the 100 and 170 foot levels, and some very rich soft carbonate ore is being taken out. Great difficulty has been experienced in getting teams sufficient for transportation to Whitewood. C. A. Peckinpaugh, formerly employed in the Deadwood Reduction Works, has charge of the hoisting engine, and Geo. Furner of Deadwood is book-keeper.

IDAHO.

CRUSHING.—Idaho *World*, Oct. 1: Capt. Smart finished a crushing of ore this week from the Mountain Queen mine at Grimes' Pass, at the head of Muddy, and the result was fully equal to expectations. The ore was crushed in Morrell's mill in Lewis' gulch. Four or five thousand dollars have been put in this mine in development. The ledge is 30 feet wide—all ore—some high grade and some low grade, but averaging well. The chances are more than favorable for a sale of this mine, as well as the Ohio, a short distance north of Placerville. Present indications are that the Ohio will equal or surpass the Gold Hill Co.'s mines, which have for over 20 years been among the best paying mining properties in the Territory, and still paying as well as at any time since operations began. There are three veins in the Ohio—one four feet, another ten feet, and one wall not reached, and the other from eighteen inches to two feet. The ore, by a mill test, averages $15 per ton. The pay continues from 500 to 800 feet in length.

EMMA & LAST CHANCE.—Wardner *News*, Oct. 2: The concentrator of the Emma & Last Chance Co., the capacity of which has been increased from 50 to 120 tons of ore per day, was started on Thursday, Sept. 26th. The new machinery is in place and all is complete with the exception of some woodwork on the Evans tables. This will be finished next week, when the entire plant will be in operation. The works now in use consist of four jigs, two sets of rolls and one crusher. The automatic feeder, invented by A. S. Denaugh, works to a charm. The building is most admirably arranged, and for compactness and completeness in every detail it has no superior in the country. When every department is in working order, which will be ere the expiration of next week, the output of concentrates will average from 20 to 25 tons per day.

TIGER.—Three eight-hour shifts are constantly employed in the shaft of the Tiger, which is now down 100 feet. The highest grade ore yet found in this mine is at present being extracted in this working. The vein is from six to eight feet wide. Drifting is progressing in levels Nos. 1, 2 and 3, and stoping proceeds as usual. It is feared that a scarcity of water will compel a temporary suspension of operations at the mill, until an engine can be procured. The company has a boiler in place, but as the concentrator has been run successfully by water-power, no engine was provided. The mine never looked better than at present, and enough ore is in sight to keep the mill running an indefinite period.

LOWER CALIFORNIA.

ALAMO.—Cor. San Diego *Union*, Oct. 3: Over 200 mining properties have been denounced in this district within a radius of five miles, and possession has been given by the Government to the owners of nearly 50, while others are undergoing preparatory development. Four or five small mills are already in operation, and two or three others will soon be on the ground, and all, I believe, aim to run night and day. The principal mines are on the northeast slope of Santo Tomas mountain and in the valley west of the town. Several are located on Alamo peak, and others are being worked to the north of that mountain in Mexican gulch. The whole country is of a granite formation, interrupted by trap dikes. The quartz veins are often well defined, and large quantities of iron ore are associated with the quartz and is especially auriferous. Large specimens of iron ore were taken from the Encantada mine that were rich in free gold. This iron ore is characteristic apparently of the district and forms a considerable portion of the paying ore that is mined. Six of the best mines in the district were sold for $30,000 to the English capitalists who succeeded the International Co. of Mexico, and we are informed that ore of a very high grade was already exposed in them sufficient in quantity to more than cover their cost. Wages vary from $3 to $4 per day, Mexican silver; those who work above ground usually receive $2 per day, while those working in tunnels or shafts receive $4 per day. Board is $1 a day at the restaurants, none of which may be said to be first-class. Few American miners will seek Alamo for work at these prices. Even at the prices, many were out of work, and men were leaving daily, some on foot in search of work, with the nearest prospect of employment 35 miles away. As yet the mines are merely prospects, none of them having been developed to any depth much beyond 50 feet. The character of the formation is unfavorable to the idea of the mines proving of permanent value. Granite is usually looked upon with more or less suspicion, but the abundance of auriferous iron ore is a good indication, and there are some other features peculiar to the district that lead one to watch the future developments with interest.

MONTANA.

RED LION DISTRICT.—Phillipsburg *Mail*, Oct. 5: A camp which promises a good deal for the future is that now known as the Red Lion, located about 1½ miles east of Georgetown. This camp is comparatively new. The Red Lion Mining Co. was organized last March, and has since been operating in a very satisfactory manner; but not much was accomplished until the middle of February, when an ore body came in sight that assured them success, and they at once commenced the construction of a ten-stamp mill, which was completed and put in operation about four weeks ago. This property was first opened up by Henry Schnepel and others in 1869, and the old arastra used in those early days for treating the ores is still on the ground. These parties were not successful in their operations, and after sinking two or three shafts and some $30,000, they abandoned the camp, and it remained unmolested until the past year. The first development done by the present company was on shaft No. 2, which was sunk down 60 feet, where the big ore body is deposited. They then drifted east on the ledge and connected with shaft No. 3 by a raise. This was done principally to get pure air in the shaft, which has already become quite pungent. The drift was then run in an easterly direction on the vein, and is now in 100 feet from shaft No. 3. The ore body averages six feet in width, the entire distance, and nothing but solid ore has yet been taken out of these diggings. The company is soon to build a shaft-house, and when that is completed, it is the intention to continue sinking the shaft. The ore is decomposed quartz, averaging about $12 in gold, and requires but little labor in breaking. At the mill they take off a nice quantity of amalgam from the plates every day. On the west side of the gulch, in a direct line between the Red Lion and the Granite mountain, about one mile from the Red Lion and 2½ miles from the Granite, is the Diamond, another very promising property. The Diamond Co. has a crew of men sinking a shaft that is now down 50 feet, and they are already getting out some very rich gold ore with indications of soon reaching a large body. Old miners and all who have visited this section say the future prospects for this camp are the best to be found anywhere in Montana, and with the same amount of work and expense it is now making the best showing of any property ever opened up in the Territory. They have an abundance of water and timber close by.

NEW MEXICO.

DEVELOPMENT WORK.— Silver City *Enterprise*, Oct. 4: The Mamie Richmond, of Hillsboro, has been closed down, followed by the usual number of miner's liens on the property. The Deep Down mill was sold in St. Louis recently for $540. Of course this was subject to the Davidson & Co. attachment for $6000. A settlement has been effected by Davidson & Co. taking a one-eighth interest in the property. Work will soon be resumed in the mine. The owners of the Flower Queen mine, near Cook's Peak, have shipped ten carloads of ore to various reduction works. These ores have run about 30 ounces in silver, 30 per cent lead and 30 per cent zinc. This character of ore makes it undesirable to lead smelters, and the owners have determined to send a quantity to Swansea and Freyburg for reduction there.

UTAH.

BULLION PRODUCT.—Salt Lake *Tribune*, Oct. 4: The week has been a fair one in mining matters, with about average output of ore and bullion. The receipts in this city for the week ending the 2d were to the value of $122,623.13 in the aggregate, of which $78,337.55 was in ore and $44,285.58 was in bullion. For the previous week the receipts were $50,326.46 in bullion and $60,799.29 in ore, a total of $111,125.75. The product of the Ontario for the week was from ore sales, $14,884.93; bullion, 18,735.17 fine ounces; an approximate total of $33,620.10. The Daly output for the week was in ore sales, $5823.61; bullion, $20,354.83; a total approximately of $26,178.44. The Horn Silver election occurred on the 1st, the old board being re-elected. No local reports come from the mine or its operations. Fine bar receipts in this city during the week were in value $1300; gold bar, $3500; bullion, $24,860.58. The Hanauer smelter produced during the week bullion valued at $14,625. Ore receipts in this city during the week were to the value of $41,343.55 by Wells, Fargo & Co. and $36,994 by McCornick & Co., including $2025 Crescent.

MECHANICAL PROGRESS.

LIMITS OF STEAM EXPANSION.—The following extract from a circular issued by the English builders of a high-speed engine said to run satisfactorily at 700 revolutions per minute and to develop 200 horse power, is interesting, since it attempts to confine the use of double and triple expansion to certain limits: If the boiler pressure always exceeds 70 pounds, it is worth while to use a compound engine; if as high as 150 pounds, a triple-expansion engine. If the engine exhausts into a vacuum, the corresponding pressures will be about one-fourth lower. The extent to which the steam may be expanded with advantage depends upon the boiler pressure. If the expansion is carried to more than a certain number of volumes, it is advantageous to divide it into two stages—*i. e.*, to expand partly in a high-pressure or small cylinder or cylinders and partly in a low-pressure or large cylinder or cylinders. With still greater expansion it is worth while to expand in three stages—*i. e.*, in three successive cylinders of increasing diameter, and so on But although there are great practical and economic advantages in the system of expansion in successive stages, there is no essential difference in principle between expanding, say, eight times, in a series of three cylinders, with a comparatively late cut-off in the first or smallest one, and expanding eight times in the largest of the three only, with the steam admitted to it direct and cut off at one-eighth stroke.

GLYCERINE IN TEMPERING. — Glycerine is found to possess many advantages in tempering steel and cast iron. The specific gravity of the glycerine may be varied between 1.08 and 1.26 at 15 deg. Cent. by adding water, according to the composition of the steel. The quantity of glycerine should be from one to six times greater than the weight of the pieces to be plunged into it, and its temperature may be varied from 15 deg. to 200 deg. Cent., according to the hardness of the metal. The harder the steel to be tempered, the higher should be the temperature of the glycerine. To increase the quenching power of the bath, various salts may be added. Thus, when a harder temper is required, protosulphate of magnesia may be added in quantity from 1 to 34 per cent of the liquid, or from ¼ to 4 per cent of sulphate of potassium. For a softer temper 1 to 10 per cent of chloride of manganese and 1 to 4 per cent of chloride of potassium may be added. The principal advantages to be derived from these methods are: 1. The temperature of the aqueous solution of glycerine may be varied within wide limits, the boiling point of pure glycerine being 290 deg. Cent. 2. Owing to the fact that solutions of glycerine dissolve most salts that are soluble in water, the quenching properties may be varied by readily dissolving in the bath such salts as suit the kind of metal to be tempered and the degree of temper required.

IS STEAM LOSING ITS GRIP?—There are motors—and motors, and the query is sometimes propounded, "Is the use of steam to be superseded by any other motor?" Sometimes it has seemed as if gas and compressed air and magnetism and electricity were, either one or all, going to dethrone the old king and usurp his functions, but he yet holds his scepter and reigns supremely in a hundred thousand engine-rooms. Other aspirants for public favor have been heard and tried, with more or less success, but the steam boiler and engine still hold sway in the machine-shop and factory, where their faithfulness to duty and mighty power have stamped them as trusted servants. It will take a long time to prejudice the trades against the use of steam—but the present generation will have passed away before it will be laid aside. The hand of the engineer and his inventive genius will be exercised to improve the boiler and engine until they reach the perfection of science, when there will be no necessity for their expulsion, for they will then have no superiors. The electric motor will have its sphere of usefulness; it will be popular for a thousand purposes, but it is doubtful whether it will ever become anything more than an auxiliary of the steam engine.

STEEL HOUSES NEXT.—A very favorable account is given in the French papers of the new system of building houses of steel plates, introduced some time ago by M. Danly, manager of the Societe des Forges de Chateleneau, and who has set forth the many advantages in an interesting and plausible manner, attracting considerable attention. M. Danly has satisfactorily ascertained that corrugated sheets of no more than a millimetre in thickness are sufficiently strong for building houses several stories high, and the material used allows of quite a variety of architectural ornamentation. The plates thus employed are of the finest quality, and, as they are galvanized after they have been cut to the sizes and shapes required, no portion is left exposed to the atmosphere. It is asserted that houses constructed in this manner are very sanitary.

A PERMANENT AND DURABLE JOINT can, it is said, be made between rough-cast iron surfaces by the use of mineral asbestos mixed with sufficient white lead to make a very stiff putty. This will resist any amount of heat, and is unaffected by steam or water. It has been employed for mending or closing cracks in cast-iron retorts used in the distillation of oil and gas from cannel coal. The heat being applied to the bottom of retorts, and the temperature of the iron maintained at a bright red heat, after a time the bottom of the retort would give way, the larger portion of the crack being downward toward the fire. The method employed was to prepare the mixture, and place it on the top of a brick, then put the brick on a bar of iron or shovel, and press the cement upward to fill the crack in the iron, holding it for some time until it had penetrated the cavity and somewhat set. Of course, during this operation, the lid was removed from the retort, so that no pressure of gas or oil forced the cement outward until set.

TO ESTIMATE BRICKWORK.—Readers in many branches of trade will be glad to know this method of estimating brickwork, which is obtained from an authority on the subject: Ordinary bricks are about eight inches in length, and with the mortar joint about half that in width, so that each brick on the flat will give a horizontal surface of about 32 square inches, or 4½ bricks will cover a square foot. As ordinarily laid, there are nine courses to every 24 inches, or 4½ to the foot. Four and a half courses, with 4½ bricks to the course, will give 20¼ bricks to the cubic foot. Waste, cutting and closer joints will easily require an allowance of 21 bricks per cubic foot, which will be found a very convenient figure for estimating the number of bricks required for a wall of given hight and thickness, as it thus becomes unnecessary to find the cubic contents of the wall, but merely to multiply its face area, or the product of its length and hight in feet, by seven-fourths of its thickness in inches, which, as the thickness is always some multiple of four inches, is a very simple process.

ZINC IN CONTACT WITH BRICKS.—Recent experience in Germany points to the fact that under some conditions sheet zinc, when in direct contact with brickwork, suffers from rapid corrosion. It appears that in building the Berlin City market halls some sheet zinc work which rested upon brick walls was deeply pitted at a number of places, and particularly where the metal was in direct contact with the bricks. Chemical examination of these showed that they contained as high as 1.14 per cent of soluble salts, capable of producing the destructive effects noted, and stimulated to more energetic action by moisture. The proportion of such salts will vary with different kinds of bricks, and in some there may be nothing to induce such corrosion as that here noted. It would be an advisable, and, in the end, a cheap precaution to avoid immediate contact of sheet zinc and brickwork by inserting a layer of roofing-felt or similar material.

IRON AND STEEL.—While the population of the United States during the past ten years has averaged about 4 per cent of the estimated population of the globe, the consumption of iron and steel in this country has averaged 30 per cent of the world's consumption and now exceeds 40 per cent. The consumption of iron steadily increases, notwithstanding the recent enormous reduction in its use for railway purposes. Both iron and steel are being used more and more widely every day in buildings, bridges and other structural work; and while the American product for 1889 will exceed that of Great Britain, it is not large enough to supply the home demand. One cause of the extraordinary growth of the iron and steel industries is the cheap conversion of iron into Bessemer steel and the ready adoption of steel to structural shapes for ships, bridges and buildings; into nails, wire, axles, springs, tools, shafting, etc.

A MACHINE TO SEW THE MOUTHS OF SACKS.—The Winnipeg *Sun* says that Robert Little, of Cypress River, has constructed a machine to sew the mouths of sacks when filled with flour. The bag is sewed with wire instead of twine, thus reducing the cost, and the work done is in every way as perfect. The bag being placed in position, by a single draw of a lever the wire is taken off spindles along the length of the machine in a groove, cut into lengths about an inch long, each length made into a staple, which is driven into the bag and clinched. The mouth of the bag is doubled up; thus the staple is driven through four ply of cloth. The staples are about an inch apart. The machine is all iron, and occupies a space about two feet each way.

PRESSED STEEL AT THE PARIS EXPOSITION.—The exhibit of pressed steel at the Exhibition is a good one, and shows, probably more than any other display, the tortuous shapes in which good steel can be worked without fracture. Immense boiler plates, tender frames and other engineering details are shown made from one single large piece of steel without perceivable fracture. There are works in this country which are prepared to do all kinds of this class of work.

TEMPERING COPPER, one of the lost arts, has been accidentally discovered, and tests of the quality of the copper thus treated have shown remarkable strength and wearing qualities. It will be especially valuable for the bearings and commutators of dynamo machines, and for journals of locomotives and cars. An establishment in Pennsylvania is now placing the metal upon the market.

SCIENTIFIC PROGRESS.

Surface Tension of Liquids.

Curious effects appear when liquids having different superficial tensions are brought together, and when solids containing volatile properties are thrown upon a liquid, writes W. H. Larrabee in the *Popular Science Monthly* for September. With two liquids that will mix, as water and alcohol or ether, the tension at the point of contact becomes null, and the lighter fluid spreads out over the other. This is followed, according to M. Van der Mensbrugghe, by a retreat of this fluid toward the point where it was dropped, in consequence of an increased tension given to that point by the cooling that follows the evaporation of the dropped liquid. If the liquids will not mingle, as when oil or turpentine is dropped on water, the drop spreads over the surface, forming a thin layer upon it which is marked by beautiful plays of colors.

M. Devaux exemplifies one of these effects by an experiment in which a tin boat, having a notch cut in the stern, is launched upon the water. On letting a drop of alcohol fall at the notch, the boat moves away as if driven by some repulsion. There is, however, no repulsion; but the tension astern has been destroyed or diminished, while that forward continues in full force to draw the boat onward. If a bit of camphor be substituted for the alcohol, its vapor has the same effect upon the tension, and the boat may be made to sail regularly, with considerable speed, for hours. The experiment is made more spectacular by furnishing the boat with a mast carrying a flag.

In another experiment described by M. Devaux, a few granules of camphor are sprinkled upon mercury, and breathed upon till a kind of lye is formed, when a multitude of long-tailed "tadpoles" appear swimming over the surface of the mercury. If, now, we breathe continuously from one side upon the mercury, the "tadpoles" will become more lively, and direct themselves against the breath, coming up to the very edge of the mercury.

The Flight of Insects.

A contributor supplies instances of the high speed attained by insects in their flight, many of them being able to outstrip swift birds. It has been computed that the common house fly in ordinary flight makes 600 strokes per second and advances 25 feet, but that rate of speed, if the insect be alarmed, may be increased six or sevenfold, so that under certain circumstances it can outstrip the fleetest race-horse. It is no uncommon thing to see a bee or wasp endeavoring to get in at the window of a railway train in full speed. and it is calculated that if a small insect can fly faster than a race-horse can run, an insect as large as a horse would be able to travel as fast as a cannon-ball. Leunwenholk relates an exciting chase, which he beheld in a menagerie, about 100 feet long, between a swallow and a dragon fly—among the swiftest of insects. The insect flew with incredible speed and wheeled with such address that the swallow, in spite of its utmost efforts, completely failed to overtake and capture it. A pigeon-fancier of Hamme, in Westphalia, recently made a wager that a dozen bees liberated three miles from their hive would reach it in better time than a dozen pigeons would reach their cote from the same distance. The competitors were given wing at Rhyhern, a village nearly a league from Hamme. The first bee reached home a quarter of a minute in advance of the first pigeon. Three other bees reached the goal before the second pigeon, the main body of both detachments finishing almost simultaneously an instant or two later. The bees, it may be mentioned, had been handicapped in the race, having been rolled in flour before starting for purposes of identification. According to Chabrier, the male of the silkworm moth travels upward of 100 miles in one day, and there are many of our British moths, as entomologists well know, which can cover long distances in an incredibly short space of time.—*St. James Gazette.*

WHY THE LEAVES TURN.—Why the leaves turn is a question that puzzles many people at this season of the year and is one that is well answered by an eminent botanist in *Field and Forest*, who says: The common and old-fashioned idea is that all this red and golden glory we see now is caused by frosts. A true and scientific explanation of the causes of the coloring of the leaves would necessitate a long and intricate discussion. Stated briefly and in proper language, those causes are these: The green matter in the tissue of a leaf is composed of two colors, red and blue. When the sap ceases to flow in the fall, and the natural growth of the tree ceases, oxidation of the tissue takes place. Under certain conditions, the green of the leaf changes to red; under different conditions it takes on a yellow or brown tint. This difference in color is due to the difference in combination in the original constituents of the green tissue and to the varying conditions of climate, exposure and soil. A dry, cold climate produces more brilliant foliage than one that is damp and warm. This is the reason that our American autumns are so much more gorgeous than those of England. There are several things about leaves that even science cannot explain. For instance, why one of two trees growing side by side, of the same age and having the same exposure, should take on a brilliant red in the fall, and the other should turn yellow; or why one branch of a tree should be highly colored and the rest of the tree have only a yellow tint, are questions that are as impossible to answer as why one member of a family should be perfectly healthy and another sickly.

INTERESTING EXPERIMENT.—It is well known that nickel loses its magnetic susceptibility when heated, and that this loss occurs at a very much lower temperature than in the case of iron. This property is shown very neatly by a simple piece of apparatus. A small copper disc is suspended by means of two hooks and a pair of threads from a support, so that it can swing in its own plane, forming, in fact, the bob of a pendulum. A small bar of nickel projects on one side from the edge of the disc, and opposite to this nickel bar is a steel-bar magnet fixed in a horizontal position in such a way that when the nickel is in contact with the magnet the pendulum deviates slightly from the vertical. The copper disc is blackened, in order that when heated it may cool again as rapidly as possible. When the apparatus is left to itself, the nickel is attracted by the magnet and remains in contact with it. When the nickel bar is heated by means of a gas flame, it almost immediately loses its magnetic susceptibility and ceases to be attracted; it therefore swings away from the magnet, in obedience to gravity. By the time that it is swinging back toward the magnet, it has become cool enough to have regained its magnetic susceptibility, and is, therefore, again attracted by the magnet, but it falls away again, almost immediately, owing to its being brought into the flame. If the flame is kept steady, the oscillation can be kept up for some ten minutes.

THE FIXED STARS, as is now well known, are not fixed, but have motions which are constantly varying their relative positions with each other. The familiar appearance of the "Dipper" in the northern heavens is gradually losing its shape, and in a few thousand years will bear no resemblance thereto. Even the North star is a moving body. It is quite well known that it does not occupy the exact position of the pole, but is approaching thereto. It is upward of a full degree from it. It will come within one degree of it about 1944 A. D., and will remain within a degree of the pole 300 years, making its nearest approach about 2102, when the declination will be 89 degrees, 32 minutes, 23 seconds.

ONE REMARKABLE COINCIDENCE of the great storm on the Atlantic Coast, recently, was found in the Upper Geyser Basin of the Yellowstone (Montana) National Park, which experienced several subterranean convulsions, followed by tremendous explosions. The great geysers, the "Giant" and "Giantess," were unusually active during the commotion, and others that were deemed extinct flowed freely. The connection between the Eastern storm and the Western hot-water ebullition will furnish an interesting study for the scientists.

WRITING AS A LOST ART.—Will the coming man write? asks the Atlanta *Constitution*. Not at all. There will be no more need of his learning to write than learning to spin. Writing will have become one of the lost arts, and a wholly unnecessary art, by the time the coming man appears. His writing will be done by the phonograph, which will be placed on his desk as pens and ink are now, and whenever he has a story, a poem, an essay, or a private letter to indite, he will simply talk into the phonograph and send on the plate which has recorded his words.

A REMARKABLE BERRY.—The "miraculous berry" of West Africa, the fruit of Sideroxylon dulciferum, was lately exhibited to the London Linnean Society. The soft, sweet pulp with which it is covered so affects the nerves of taste that sour substances—even tartaric acid, lime juice, and vinegar—have a flavor of absolute sweetness after it has been eaten. Living plants of this and of thaumatococus, whose fruit possesses similar properties, have been received at Kew Gardens.

MAMMOTH REMAINS IN SIBERIA.—The abundance of remains of the mammoth in Siberia is almost incredible. Middendorf reckoned that at least 100 pairs of tusks had been put upon the market yearly during the last two centuries, and from personal observation Nordenskjold is inclined to regard this estimate as too small. It thus appears that in recent modern trade useful tusks of more than 20,000 of these animals of past ages have been collected.

LIGHT AND LIFE.—An English scientist has been making experiments to determine the important part light plays in the development of animal life. A dozen tadpoles were confined in a box from which every ray of light was excluded. The result was that only two of them developed into frogs, and these were short lived. The others increased considerably in size, but never left the tadpole form.

ROCK CRYSTAL.—Pieces of rock crystal heated in a platinum tube and dropped into water fly all to pieces, but if a drop of melted crystal is allowed to fall into water, then, though there is a great commotion, it does not break, but remains clear.

GOOD HEALTH.

Disease of the Heart.

In diseases of the heart which persist for a long time and finally end—as a very large proportion of them do—in slow decline and a lingering death, dropsy always sets in. In the last stages it is a most intractable symptom, and adds greatly to the suffering experienced. In the treatment, physicians have been wont to depend largely upon a diet of milk, which, in cases where it is well borne and can be persisted in, always acts well. But there are many patients who, for various reasons, cannot be kept on a milk diet for any length of time. To some it becomes abhorrent after awhile, and others really cannot digest it properly, as simple food as it is. And besides that, a milk diet is unsuited to no small proportion of patients affected with cardiac diseases. We have reference to those who cannot be kept quiet, but insist upon being up and about, often in the open air, if not engaged in light duties. Prof. Germau See of Paris has long been engaged in study to learn what elements in milk rendered it such an admirable agent to stimulate the kidneys, increase the flow therefrom, and hence prove of such great service in dropsies. As a result of his investigation he is convinced that the one important element is sugar of milk. Acting upon that theory, he selected 25 patients with heart disease, in all of which there was more or less dropsy. To each he gave 100 grammes of the sugar of milk a day, dissolved in two quarts of water. In all these cases a marked effect upon the kidneys was felt within from 24 to 45 hours, and the dropsies diminished rapidly, and almost all such swellings disappeared altogether after a series of treatments, lasting from six to eight days. This discovery is likely to prove one of the most important which has been made in the medical world for years.

A REMINDER FOR FAMILIES RETURNING TO A CLOSED HOUSE.—The *Monthly Sanitary Record* gives the following hints regarding the dangers of vacated houses: A good many people will soon be returning to their homes after their summer's vacation, and we would caution them about the danger of returning to a house which has been closed for some time, especially when the house is connected with the public sewer. In all probability the water seal in the traps of the plumbing fixtures will have become evaporated, and the air from the sewer permitted to fill the house. The germs of typhoid fever or other disease thrown into the public sewer may possibly be carried into the house in this way. It has frequently happened that typhoid fever has broken out in a family recently returned from a vacation of several weeks, and in all probability the disease has been caused in this manner. Families about to return to an unused house should have some one open all the doors and windows and thoroughly air the house for several days before their return, and also with buckets or hose to flush out the entire plumbing system of the house, thus filling all traps and cutting off communication with the sewer. Let no one neglect these simple precautions; they may possibly prevent the sickness or death of some member of your family.

EXECUTING BY ELECTRICITY.—London *Iron* sums up the difficulty which must attend executions by electricity in the following manner: Every particle of the nervous tissue is polarized, and polarization causes each particle of matter to revolve on its axis, which means the stretching of the nerves out of all proportion, and consequently the most intense pain. But the great fault with execution by electricity is that it is almost impossible to ascertain just how strong a current will kill a man instantaneously and yet not be a barbarous mode of killing. If the current be but a few volts stronger than that required to instantly execute a certain person, the consequences would be terrible. It would disfigure the body beyond recognition, and would disintegrate every portion of the corpse. Should the current be just a trifle too weak to execute a person, it would throw him into a trance so death-like that it is probable that the body would be buried alive.

A REMEDY FOR PRICKLY HEAT.—Olive Harper, in a recent article, gives the following remedy for prickly heat, and a hint or two as to what to do when the festive mosquito plants his tiny bill in your flesh: I have just discovered that if any person subject to prickly heat in summer will bathe the places in a weak solution of saleratus water and dry them with a soft cloth, and afterward powder them with a powder made of equal parts of fuller's earth and rice flour, he will have perfect ease. It should be done night and morning in the hot weather, and if a mosquito bites you, don't try any heroic remedy, but simply apply a little cold cream, which somehow overcomes the poison and irritation when nothing else will. I have seen children that were nearly wild with the irritation of many mosquito bites, calmed in a moment by the application of cold cream.

DANGER IN THE RUSSET SHOE.—The Boston *Express* says the russet shoe, which greets the eye everywhere, has been found to be a regular little arsenal of poison. In order to give the leather its peculiar color, chemicals of a very poisonous character are used. When the shoes become wet, the skin, unless thick stockings are worn, absorbs some of this poison. Pimples and blotches in yellow color are formed, and at times become quite painful. Physicians at first were puzzled by the eruptions shown them by patients, but after studying the matter, they imputed the cause of the trouble to this dainty pet of the fashionable people.

THE MOST IMPORTANT FUNCTION OF UNDERGARMENTS.—It is a great mistake to suppose that the material of which a garment is made is the most important consideration in selecting warm underclothing. The way in which the fabric is prepared and manufactured is of more vital importance as regards heat or coldness of the body than the actual material. A light garment with large meshes is more effective against cold than a close, heavy one. Whatever an underveat may be made of, its real value as a protector from cold depends upon its ability to inclose within its meshes a certain quantity of air. This is indeed the most important function of undergarments, viz., to encircle the whole body with an envelope of warm air, and a vestment that does not keep a continual layer of warm air next to the skin is of very little use.

IMPORTANT IN FUMIGATION.—Dr. Squibb of Brooklyn (*Medical News*) in a recent address on sulphur fumigation in the prevention of infectious diseases, directed attention to the important fact that, in the absence of moisture, the penetrating power of sulphurous acid gas is only slight, and for this reason there should be an abundance of aqueous vapor in the apartment in which the sulphur is burnt. Boards of Health neglect to emphasize this fact, which is not known to the laity. The *Medical News* recommends that water be kept boiling in the room in which gas is being generated. Dr. Squibb also called attention to the relative uselessness of chlorine gas as a disinfectant in the absence of aqueous vapor.

NERVOUS HEADACHE.—Dr. Batrom has lately employed common salt in the treatment of nervous headache, and Dr. Nothnagel has recommended the same in the treatment of epilepsy. Dr. Cerne attributes his success in the treatment of the first affection with this remedy to an increase of the hydrochloric acid of the gastric juice. In a case of gastralia and headache, or "brow ague," in which the treatment simply consisted in augmenting the quantity of salt in the food, he noticed that the dyspeptic symptoms and stomach pains disappeared entirely.

DEATH FROM AN INSECT'S STING.—A short time since C. Mignard, a compositor of Hoboken, N. J., was stung on his lip near the nose by an insect. He rubbed the spot with his finger when it itched, and his face swelled terribly. He died on Sanday last and it is thought that the lead from the type which he handled poisoned him.

USEFUL INFORMATION.

BUYING AND KEEPING ICE.—It may be a useful hint to housekeepers that the cheapest way to buy ice is to get 100 pounds at a time. Properly managed, it will last a week, even for a large family, and be sufficient for all requirements. When the price of ice is 35 cents a week for the daily serving of eight pounds (the smallest quantity served), the cost of a piece weighing 100 pounds is 40 cents. It is plain to be seen that for the additional 5 cents you get nearly double the quantity of ice. The man who delivers it will carry it down cellar for you, place it where you wish and crack it in four pieces if requested to do so. It should be wrapped first in a piece of old muslin or linen, and then in a dry blanket. If you have no ice-chest, it can be kept in a large tub, but it must rest on something which will raise it three or more inches from the bottom of the tub, so that it will not lie in the water which will drip from it—inverted flower-pots will do. A piece of carpet, an old blanket or several thicknesses of a large newspaper should be thrown over the top of the tub, to keep out all the air possible. The tub should be emptied, scrubbed and wiped as dry as possible once a week at least. After bringing up a piece of ice for the refrigerator, see that the remainder is well wrapped up. If the piece you have brought up should be too large to go into the ice-chamber, be careful not to waste any in cracking. It is a good plan to measure the length and width required, and then break the piece as near the size as possible, remembering that the larger the piece of ice, the less it melts; also, that if the ice-tank is kept filled, the better the ice will keep. If you have not a good pick, a strong knife-blade and a hammer will crack the ice without splintering it, as so many picks do.—*August Table Talk.*

RAPID ELEVATORS.—The swiftnes with which passengers are carried—if "shot" is not the more appropriate word—from lower to upper floors of buildings in elevators of the latest construction is not a little trying to the nerves of unaccustomed travelers. There is presumed to be, however, no sacrifice of safety to speed. The *Northwestern Architect* remarks: "Speaking of the Eiffel tower, it may not generally be known that two of the elevators used therein are of American make; the others were furnished by M. Edoux of Paris. The French elevators have speed of 200 feet per minute, while the American has just double that, or about 400 feet per minute. This is not a high rate of speed for an American elevator, one having been timed to a speed of 126 feet in 6½ seconds, a rate of 1163 feet per minute, while a working speed of from 500 to 700 feet per minute is not an uncommon rate. Nothing like this has been seen in Europe, however, and, no doubt, many who ride in the Otis elevators at the Paris Exposition will quite lose their breath on the trip. The Exposition will undoubtedly do much to popularize the elevator abroad, and should it create a demand for the American machines, so much the better for our elevator builders."

THE CARE OF TINWARE.—Many women spend a good deal of time in trying to keep tinware bright by scouring it with some kind of powder each week. This is a poor plan, as the less scouring tinware receives the better. It removes the outside coating, and though it be kept looking bright by hard labor, it will never look as well as if it were washed in clean, hot suds. To be sure, when the tin is stained the stain will have to be removed by scouring, but only enough should be done to remove the stain. Kerosene and powdered lime, the lime very finely pulverized, is claimed to clean tinware nicely, and wood ashes is also recommended for the same purpose. A better powder may be made of the soft white cinders that are usually thrown away. After sifting the ashes from the stove, pick from the cinders all the soft, white ones. They must be soft enough to crush into a powder between the thumb and finger, and after crushing up fine they are ready to be used. First wash and wipe the tin clean, then with a flannel rub it over with the powder. It is so fine that it does not scratch or wear off the coating and gives the tin a beautiful polish. Never use lye on tinware; it will ruin it. Keep an old toothbrush for getting into the seams around the handle and rim. Never put vinegar, tomatoes, or any acid substance in tin. When tins are new, first fill with boiling water and let stand for a little while before using. To mend holes in tinware, use putty, putting it on the outside.

THE pine fiber business seems to be fast rising to an important industry. It is now stated that the American Pine Fiber Company, Wilmington, N. C., has effected an organization. The authorized capital is $1,000,000, and the object of the corporation is to manufacture textile fabrics, such as matting, carpeting, burlaps and bagging, from the fiber of the straw of the long-leaf pine. The company has purchased all the patent rights and the plant for making fiber owned by the Acme Manufacturing Company and in operation at Cronly, N. C., and will largely extend the operation of these works. The present annual capacity of these mills for the manufacture of pine fiber bagging is 500,000 yards, but the new machinery that will at once be added will more than double the capacity.

FRENCH POLISH FOR HARDWOOD DOORS.—For French polish for hardwood doors: 1. Shellac, 3 pounds; wood naphtha, 3 pints. 2. Shellac, 2 pounds; powdered gum mastic and gum sandarac, 1 ounce each; copal varnish, ½ pint; spirits of wine, 1 gallon. Mix, and shake cold till dissolved. It will be useful to many of our readers to know how to apply a French polish. This is by means of shellac varnish, using a rubber, after smoothing the surface with finest glass paper. Place the work opposite the light to see the effect of varnishing. Operate the rubber with circular motion, lifting it vertically and finishing it off at margin. Three coats are sufficient. Finish with alcohol and oil.

AUTOMATIC ADDING SAVINGS BANK.—The automatic adding savings bank will surely prove a success, especially with the young people. The bank is so constructed that it keeps an account of its contents, is made to receive one cent, five cents and ten cents, respectively, and opens automatically. Every time the deposits amount to one dollar, if the owner so desires, he may leave the one dollar, close the door again, and it will reopen every time another one dollar is deposited. It adds by merely dropping coin into a slot; one cent, bank registers to one dollar; five cents, to ten dollars; ten cents, to ten dollars; and will readjust itself every time these amounts are reached.

SMOKELESS POWDER has excited so much interest in Germany that the Emperor of Germany has, as a token of his satisfaction, promoted Colonel Kuster, the inventor, to the rank of Major-General, and made him a present of 50,000 marks (£2500). And now comes a report from the English Ordnance Department saying that smokeless powder has proved a humbug, as it will not retain its normal explosive quality under prolonged field service.

THE EIFFEL TOWER is not only an engineering but a financial success. The shareholders have now received back three-fifths of their capital, and it seems as if the entire share capital will be paid off before the termination of the exhibition, thus leaving the remainder of the 20 years for which the concession is obtained to earn interest on money which the shareholders can employ at the same time in other fields of enterprise.

THE TELEPHONE IN FRANCE.—The French Government has notified every telephone company in the country that the Government will take possession of the lines within 12 months. The service will then be furnished the public at cost.

ELECTRICITY.

New Uses of Electricity.

Among the most recent uses to which electricity has been applied, we note the following: A process has been patented in England for bleaching paper pulp by electricity. Esparto grass, hemp, flax, straw, jute, and other vegetable fibrous pulp materials are used in the manufacture of paper, by means of a solution of common salt in water or any other chloride solution decomposed by the electric current generating in it halogens such as chlorine, a cheap oxidizing and decolorizing agent equal to the most energetic solution of bleaching powder. The paper pulp is treated in bleaching tanks, where the electrolyte is raised to its proper degree of bleaching power by the action of oxygen or ozone in its nascent state, in combination with chlorine and hydrogen circulated and maintained at the required chlorometric standard by the influx of freshly electrolyzed solution to replace the corresponding quantity of exhausted electrolyte which flows out of the tank by a pipe, and also of a large peroxidized anode and a spongy lead or carbon cathode, through which an electric current passes.

"Electric Gas."

The announcement which is made that several electricians at Springfield, Massachusetts, are hard at work perfecting a process for manufacturing illuminating and fuel gas by electricity, has created a deep interest in the matter, and the outcome will be eagerly awaited, especially by every one engaged in manufacturing enterprises. The new process, it is said, consists in converting oil into vapor by means of heat created by passing an electric current through some foraminous metal, which offers serious resistance to the current so that it is heated to a very high degree. The oil that is preferred for the purpose is crude petroleum, though other similar volatilizable substances will answer. The greatest advantage claimed for this new gas—already designated as "electric gas"—is, of course, its cheapness. Seventeen cents per thousand feet is the maximum estimated cost, and thirteen cents the minimum. Then the apparatus is neither bulky nor complicated. It is asserted that a generator no larger than a common office desk, and very easy to manipulate, will supply gas for light, heat and power for a very large factory.

Applied to Spectacles.

Another of the innumerable developments of electricity now made is that of electric light in surgery. Spectacles (to be used in surgical operations) are lighted by means of a small electric lamp. The lamp is so arranged as to send a beam of cool light on the part to be examined; meanwhile the rims of the spectacles exclude the outside light from the observer's eyes.

WHERE WAS ELECTRICITY FIRST USED?—In reply to the questions by a correspondent, where was electricity first used, and who first sent a telegraph message? the New York *Sun* makes this reply: Thales, a Greek philosopher, who lived 600 years before Christ, is said to have known the electrical properties of rubbed amber. Otto von Guericke, in 1647, constructed the first electrical machine. Franklin, in 1748, killed a turkey by electricity, and roasted it on an electric jack before a fire kindled by the electric spark. Perhaps this was the earliest actual use of electricity. As long ago as 1747 electric shocks were sent over short distances. Relson, in 1794, by using thirty-six wires, one for each letter or character, sent messages over small distances. Morse simplified the telegraph, using only one wire, instead of from thirty to thirty-six wires. His first public message was, "What hath God wrought?" This was on May 24, 1844. Two days later the Democratic Convention in Baltimore nominated James K. Polk for President, and Silas Wright for Vice-President. Mr. Vail, Morse's assistant, telegraphed the news to Morse at the capitol. Morse told Wright, and the convention was astonished to get a dispatch from him declining the nomination. The convention wouldn't believe it, and sent a committee to Washington to get reliable information. This was doubtless the first news telegram sent.

QUEER ANTICS CAUSED BY ELECTRICITY.—The queer antics caused by electricity, which is coming into common use everywhere, are of daily occurrence. One of the latest happened recently at Evansville, Ind. During a heavy storm, a number of electric light and other overhead wires were blown down and crossed, and the electric fluid started out to make things lively about the streets. Sparks were hissing and sputtering in all directions; the fire department was called out, and unaware of the exact state of things, a number of firemen, civilians, and horses were knocked over by electric shocks. Finally a messenger ran to the electric-light station, which promptly shut down, when over a dozen persons were found lying about unconscious and were restored with difficulty, two of the firemen at last accounts remaining in a precarious condition. It is such little occurrences as these which make the firemen and the general public alike distrustful of the overhead wires, look they ever so innocent.

A JAPANESE UNIVERSITY.—The Imperial University of Tokio has 138 professors and teachers, all but 16 being Japanese. This year's students number 788.

TABLE OF CONTENTS.

EDITORIALS. — Diamond Mining, 279. Passing Events; The Sutro Tunnel; Academy of Sciences; Chalcedonic Pebbles: Mines and Miners on the Yukon, 286. Foundry Notes; Astronomical, 287.
ILLUSTRATIONS. — Section Through De Beers Diamond Mine, Looking North; Section Looking West, 279. Plan of De Beers Mine, 700-Foot Level; New System of Working De Beers Diamond Mine, 800-Foot Level, 287.
CORRESPONDENCE.—Yuba County, 280.
MISCELLANEOUS.—The Irrigation Surveys; An Onyx Mine; Underground in the Granite; Flumes Removed; Land Office Business for the Year, 280. California Yachts; Semi-Subterranean Rivers, 281.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 282-3.
MECHANICAL PROGRESS.—Limits of Steam Expansion; Glycerine in Tempering; Is Steam Losing Its Grip; Steel Houses Next; To Estimate Brickwork; Zinc in Contact with Bricks; Iron and Steel; A Machine to Sew the Mouths of Sacks; Pressed Steel at the Paris Exposition, 284.
SCIENTIFIC PROGRESS.—Surface Tension of Liquids; The Flight of Insects; Why the Leaves Turn; Interesting Experiment; Writing as a Lost Art; A Remarkable Berry; Mammoth Remains in Siberia; Light and Life; Rock Crystal, 284.
GOOD HEALTH.—Diseases of the Heart; A Reminder for Families Returning to a Closed House; Executing by Electricity; A Remedy for Prickly Heat; Danger in the Russet Shoe; The Most Important Function In Under-Garments; Important in Fumigation; Nervous Headache; Death from an Insect's Sting, 285.
USEFUL INFORMATION—Buying and Keeping Ice; Rapid Elevators; The Care of Tinware; French Polish for Hardwood Doors; Automatic Adding Savings Bank, 295.
ELECTRICITY.—New Uses of Electricity; Where Was Electricity First Used; Queer Antics Caused by Electricity, 285.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 292.

Passing Events.

The Milton hydraulic mine, Nevada county, is about to be worked in the same manner as the North Bloomfield—by running the tailings into old excavations, so more of them will go into the mass.

The reports from the Alamo camp, Lower California, are encouraging as to its permanency. At first considered exclusively a placer camp, it is developing into a first-class quartz district, and the mines are yielding very satisfactorily.

There is quite a little local excitement up about Ellensburgh, in Washington. Within the past week some 200 locations have been made in the new placer-fields north of the city, and a hundred locations in the new coal-fields north of the city. The new coal mines show larger veins than those at Roslyn, where 1000 men are at work.

Suits are about to be commenced against the president of the Sutro Tunnel Co. by the stockholders, involving very large amounts of money. Among other things connected with the suits will be a restraining order forbidding the Comstock mining companies paying the royalties. The matter is referred to at length in another column.

Timber Claims and Mines.

We have several times called attention to the fact that much mineral land was being taken up by agricultural claimants in this and other Pacific Coast States. The difficulty is that no one, unless directly interested, cares to go and swear to the mineral character of the land. The applicant has only to swear that to his knowledge there are no mines or minerals on the land. This is very easy for one to do who knows nothing of mines or minerals, and most of them can do it with a clear conscience. Agricultural claimants seldom have any knowledge of the mineral character of land. The patents therefore issue unless some one owning a mine or claiming mineral ground enters a contest. When these contests are made and the mineral character proven, of course no agricultural patent can issue. Nevertheless a large area of land has been taken up in the manner referred to, contrary to the desire or intention of the Government.

Of late another plan has been adopted by a class of men who are trying to take up mineral ground as timber land. They are entering this as timber land with the idea that, if no contest is made by mineral claimants, they will be able to take it. An instance is given by the Shasta County *Democrat*, which says: "The miners and prospectors of Squaw creek mining district are considerably exercised over what appears to be an attempt of a few schemers to scoop in a large area of mineral land in that district by entering it as timber land. Upon the mountain divide between the head of Squaw creek and that of Clear creek there is considerable pine timber, situated around what is known as Bohemotosh mountain. A company of Oaklanders have surveyors in the field running lines preparatory to locating timber claims thereon. This belt of country is also a mineral zone, which contains rich gold and silver quartz veins, and in which there is a number of promising prospects now being developed. Last week a couple of prospectors placed mineral affidavits on the land, the affidavits setting forth that the land is more valuable for mineral than anything else. In fact, that whole township is a mineral belt, a fact to which a hundred or more miners are willing to make affidavit, and which they ought to do before it is too late. Whatever timber there is ought to go with the mineral that is well known to be there. The Government should by all means preserve the timber for the benefit of the mining interests of that region."

Chalcedonic Pebbles.

We have received from H. Kelley of Adin, Modoc county, some chalcedonic pebbles, closely resembling the nature of an opal. Some of these have been ground and polished, and the surfaces are very beautiful. These are not true opals, but should have a value nevertheless.

Years ago opals of this same kind were found at Mokelumne Hill, Calaveras county, and there was considerable excitement about them. F. L. A. Pioche, a capitalist of this city, became interested, and it was thought at one time that large fortunes would be made from the opals. They had some value as gems, but were not fine enough, though many of them were rather good. Those Mr. Kelley sends us are of the same nature. When the pebbles are ground and polished they are very handsome, but do not have the luster of fire of the true opal. It would seem, however, that the best of these should have some little value as beautiful stones. These specimens are from the fields near Adin, Modoc county.

EUREKA-RICHMOND.—Thomas J. Reid, the surveyor appointed by the Eureka Consolidated Mining Company to investigate the alleged encroachment on their territory by the Richmond people, has filed his report. Ore has been extracted across the dividing line at different points on the sixth level of the Eureka, the excavations ranging from 10 to 50 feet. He estimates the value of the ore extracted at about $40 per ton, but has not yet calculated the quantity.

A VALUABLE ledge of sandstone for building purposes has been found on the ranch of S. D. Paxton, six miles from Ukiah, and it is said to be found in immense quantities.

THERE are only 31 men in all employed in the Bodie Con. and Mono mines at Bodie.

Mines and Miners on the Yukon.

Some uneasiness has been felt about the miners who are to winter on the Yukon river, Alaska, and its tributaries, especially those on the Stewart river and Forty-Mile creek. It was thought they were short of supplies and suffering would ensue. Chas. B. Sperry has just arrived from the various camps along the Yukon, having started from Stewart river, 1800 miles up the Yukon. This river, he believes, is the coming mining center. It runs through a fine bottom, from three to ten miles wide, and anywhere in the gravel color can be found. The only places where it pays to work are the points of bars, where gold is lodged along the edges. The only time the bars can be worked to advantage is during low water. The best average is sixty days' work. The hardier vegetables may be raised on the Stewart river bottom. In the fall Mr. Sperry went to Forty-Mile creek, 120 miles below the Stewart river, and looked it over. From there he went to Seventy-Mile creek, which is 50 miles below. He did not like either place, and returned to Stewart river and wintered there with only nine men. This was two years ago and the winter was a mild one.

The third year he spent on Stewart river until July 1, 1888, when he left on account of the destruction of a wheel which he had built for raising water.

The only mines that are paying at Forty-Mile creek are the potholes in bedrock that are filled with blue mud, carrying coarse gold. This has to be worked under the ice early in the spring or through the winter. Besides these the Bonanza and Franklin gulch mines are paying better and better every year, for the reason that they are getting the moss and timber off the ground and the frost is getting out.

The spring was passed on Stewart river in building wheels. Three large wheels were put up for the purpose of working low-grade dirt off high banks, but owing to the frost in the ground they were all failures. The most extensive prospecting being done in the country is at the head of Stewart river by McDonald & Ellis. The first prospect ever struck above the falls, 240 miles up Stewart river, was late last fall, when they picked gold outside of a gravel flow. Great hopes are entertained that these parties will strike places which it will pay to mine.

There are now about 250 miners on the whole of the Yukon, and even if the Alaska Commercial Company should be unable to get any supplies up the river there will be plenty of time for all the miners to get to the mouth after it is too late for the steamboats to get up. The story of starvation and scurvy among the miners is without foundation. There is a surplus of food supply, as the country affords plenty of moose and caribou meat, which can be bought of the Indians for a song.

The men at Forty-mile creek and on the river are all well, and there was a plentiful supply of provisions for the time being. Harper, one of the agents of the Alaska Fur Company, was on his way up the river to establish a post at the mouth of the Heller river, which is 1000 miles above Stewart river. To get there he had to pass Forty-mile creek, and if the men were in want he could have furnished them with plenty of provisions.

LIENS ON MINING PROPERTY LAWFUL.—The Supreme Court affirmed the decision of the lower court in the case of the California Powder Co. vs. the Blue Tent Consolidated M. Co., limited. The action was brought by the powder company to recover judgment for the balance due for powder and other explosives sold to the mining company and used on defendant's property in Nevada county, and to enforce a lien therefor on the property. Judgment was rendered by the lower court in favor of the plaintiff for the full amount and attorney's fees, and the defendant appealed from the judgment and order denying a new trial, admitting the debt, but claiming that a lien on the property was not lawful.

THE shipments of quicksilver from the mines near Calistoga for September were 709 flasks. One company paid a $10,000 dividend.

BABY LEWIS of Grass Valley carried off the first prize at the Fresno Fair. Its father is a miner in the Idaho mine.

The Sutro Tunnel Company.

On Wednesday afternoon legal notices were served upon the following Comstock mining corporations and companies: Consolidated California and Virginia, Chollar, Potosi, Best and Belcher, Alpha Consolidated, Belcher, Bullion, Challenge Consolidated, Confidence, Consolidated Imperial, Crown Point, Exchequer, Gould and Curry, Hale and Norcross, Kentuck, Mexican, Ophir, Savage, Overman, Sierra Nevada, Segregated Belcher, Union Consolidated, Utah, Occident and Yellow Jacket. These notices were to the effect that the companies must pay all royalties to the treasurer of the Sutro Tunnel Co., and not to the Union Trust Co., or the Comstock Tunnel Co. of New York, or its agents.

The companies were notified that certain stockholders of the Sutro Tunnel Co. intend to bring an action, and, if successful, the companies would be held responsible for all moneys due under the contract. The notice says:

"The undersigned stockholders will bring an action against the said Union Trust Company and Comstock Tunnel Company, Theodore Sutro and other persons who have occupied a trust relation to said Sutro Tunnel Company, and other parties, all of whom have so conspired and combined together as to defraud the undersigned and other stockholders of the Sutro Tunnel Company out of their just rights, by means of a pretended absolute sale of the property, franchises and contracts of said Sutro Tunnel Company, under a decree of foreclosure in favor of said Union Trust Company as successor in interest of McCalmont Bros. & Co., whereas in truth and in fact said mortgage had been settled at a heavy discount, procured in the interest of said Sutro Tunnel Company, and was paid for with money which had been subscribed to the bonds of said Sutro Tunnel Company, and the amount paid by the Union Trust Company for said mortgage consisted of money which had been so raised; and that the object of said action will be to have it declared by a court of equity that the said pretended absolute sale of the property and franchises and contracts of said Sutro Tunnel Company is fraudulent and void as against said corporation and the stockholders thereof, and particularly against stockholders who had not subscribed to said bonds; and that said sale has no other effect in equity than as a mortgage to secure the just indebtedness of the Sutro Tunnel Company, to be ascertained by an equitable accounting thereof."

Academy of Sciences.

At a meeting of the Academy of Sciences on Monday evening a series of photographs was exhibited, showing certain cacti which are found nowhere except in Lower California. One of these will probably be called the caterpillar cereus, because it lies prostrate on the ground for some four or five feet and then lifts a shoot into the air. When one end is dying the other is in lusty life. A photograph of the wild date, or Yucca plant, not the ordinary variety, was shown. Dr. Behr, the well-known botanist, said the scenery in which the varieties photographed were found very much resembled parts of Southern Australia. He inferred that climatic conditions were similar. This, he said, was only another evidence of the influence atmospheric peculiarities have on vegetable production. In Southern Australia there is a grass which is much like the caterpillar cereus of Lower California.

The question came up as to the truth of the story about the bird called the California road-runner and its supposed habit of building a corral of cactus burrs or spines around a sleeping rattlesnake, so that when the snake attempts to escape it is impaled. Dr. Behr did not believe that this legend was true. He also expressed an opinion that if the cactus plant had no spines it would long since have become extinct. All vegetarians, whether human or brute, are fond of eating the cactus. Indeed, in some localities various beasts and birds look to the cactus for a supply of moisture to sustain organic life. In some parts of South America there is a cactus which has no spines, but it is found where vegetation is abundant and the cactus itself is not depended on for a source of moisture. In the North American deserts a cactus without spines would soon be exterminated. Dr. Behr thought that after a more complete investigation it might be found that the spines of the cactus were intended in part as a protection from birds and snakes.

It was stated that in Lower California rats build immense nests of the cactus. How they can do so without being stuck full of the barbed spines is a mystery naturalists have not solved.

Diamond Mining.

(Continued from page 279.)

All the western portions of the mine, including shafts, tunnels, ladderways, etc., are now lighted with electric lights. The necessary machinery for pulsating the deposit from the washing machines has been erected in a large compound on the floors, convenient to all the washing gears. Additions are being made to increase the capacity of the plant, so that all the deposit from the De Beers and Kimberley mines can be treated and assorted in one place.

During the year 944,706 loads of blue ground have been hauled, yielding 914,121 carats of diamonds, which realized £901,818. The average yield per load is 1283 carats.

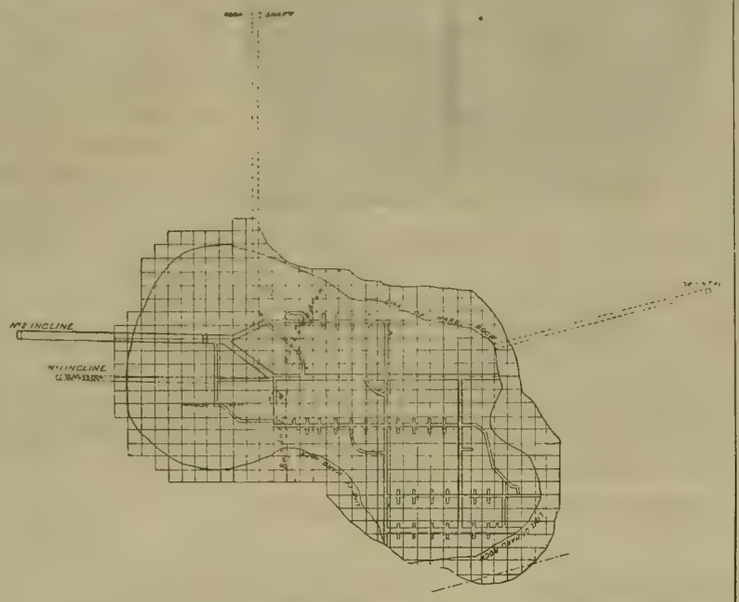
The average number of native laborers employed (exclusive of white workmen) is 2100. There are also 300 native convicts in the mine.

The president of the company states that they are making a profit of 66 per cent on their working at the present price of diamonds. In his address at the annual meeting he said: As far as the stability of the mines is concerned, there can be no doubt about that, because we have before us ample proof to show that the present generation need not fear for this, and in referring to the industry I mean the market for diamonds, for without a market our products would be useless. I have not the exact figures for 1876, as up to then no official returns were made, but I can give you the figures from 1883. From 1873 to 1880 I think the demand was not more than about a million and a half per annum. In 1876 the diamond production was about one and a half millions. I am uncertain about the period prior to 1876, but from then to 1880 I am perfectly certain of, as I was a very important factor in the diamond trade at that time. When we came to the year 1883, when the first official returns were kept, we find that the production was 2,319,234 carats, the valuation being £2,359,466, or an average of 20s. 4¼d. per carat, so that we find the demand for diamonds in 1883 was in rough figures about two millions.

In the year 1884 the production was 2,264,786 carats, valued at £2 562,623, the average per carat being 23s 2¼d. In 1885 the production was 2,287,261 carats, valued at £2 228,678. In 1886 there was an increase and I mention this simply to show that the more the production increased the price has risen in proportion, and I refer to these figures to show that the demand for diamonds has steadily increased. In 1886 the production was 3,047,639 carats, which realized £3 261,505, or an average of 21s 6d per carat. In 1887 we find the production was 3,646 889 carats, which realized £4,033,582, and the following year the production was 3,565,780 carats, realizing £3,608,217, bringing the total value for the last two years up to £7 641,799, the average being more than 20s per carat, so that the average for the last two years was within £200,000 of four millions. These were the prices diamonds were realizing before the unification; these were the prices diamonds were fetching when there were 200 or 300 different interests, when the mines were in the hands of individuals and small companies that were compelled to put their diamonds on the market and were forced to sell under circumstances not at all advantageous, because from time to time, as many of you remember, these small companies were in debt, and the diamond buyers took advantage of the situation. Just upon 4,000,000 was the production in 1888 and the price was over 20s per carat, and, unless I am mistaken, that was the year that the fight was going on between the Kimberley and De Beers mines. Diamonds were being produced wholesale and thrown upon the market, and yet after all these conflicting interests had been working against each other, the average for diamonds was some 20s per carat. Since the Kimberley mine has become the property of the De Beers consolidated mines, instead of producing the number of carats we have produced a lesser quantity and received the same amount of money for them; that will allow for the increase of blue on our floors. You see our diamonds to-day since we have had absolute control of the De Beers and Kimberley have realized 27s 6d per carat from April to June, and this month our diamonds have realized 30s per carat. I may tell you that it is not the intention of the directors to raise the price of diamonds beyond 30s, as we are making now a profit of about 66 per cent on our working.

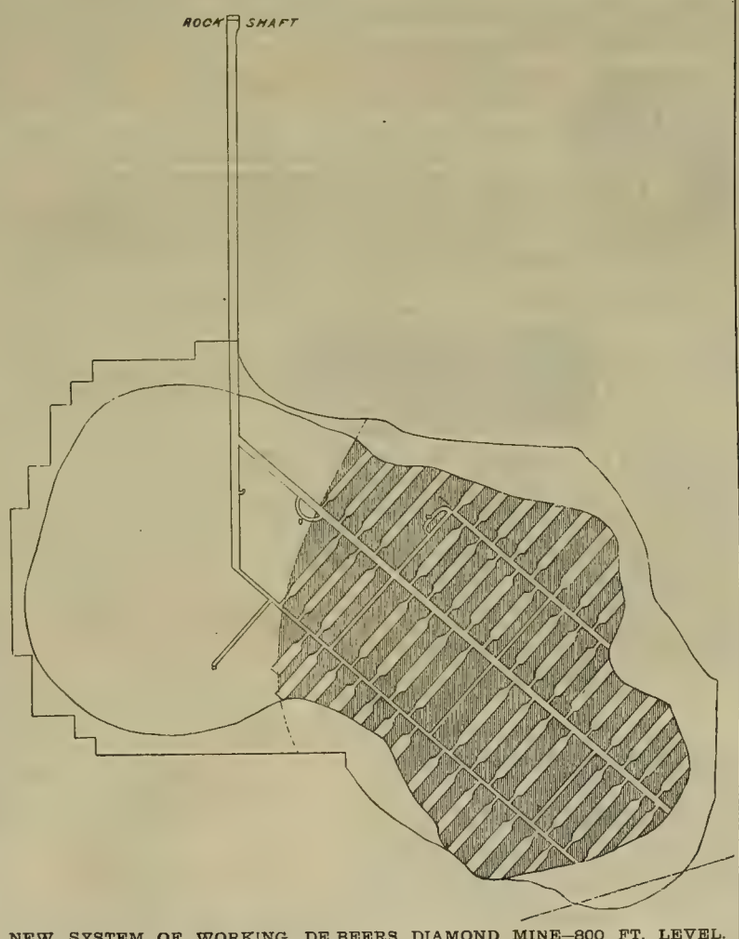
Foundry Notes.

A very large lathe has been completed at J. B. Jardine's Atlas Iron Works for turning piles to be fitted with Anderson & Elias' patent teredo-proof iron jacketing The lathe is 58 feet long and will turn a pile 50 feet long and of any ordinary diameter. In order to fit the iron jackets properly, the pile must be smooth, and this lathe was devised for this purpose. The lathe will be placed at the yards of the Anderson & Elias Co. at North Beach. The pile will be hauled from the water direct into position in the lathe. The cutters are self-feeding and move along from end to end of the lathe with rapidity. This is the first attempt to turn such large timbers in a lathe, and it can be applied to spar making without any change. A public trial was made this week, at which the Harbor Commissioners and others were present. The lathe is said to be the largest ever made, and works very satisfactorily.



Nearly all the tools and machines have been removed from the old shop of the Atlas Iron Works, on Mission street, to the new works on the Potrero, where Mr. Jardine will have much better facilities for carrying on business. Having now a water-frontage, he can do his marine work and repairing to better advantage.

F. A. Huntington & Co. received the gold medal at the Mechanics' Fair for the best display of mining machinery in operation.



The Risdon Iron Works were awarded a silver medal at the Mechanics' Fair for the best quartz-mill in operation. This was the Bryan Roller quartz mill.

The Joshua Hendy Machine Works obtained a bronze medal at the Mechanics' Fair for the best ore-feeder—the Challenge.

It will be remembered that some months ago a Chinese syndicate purchased a half interest in the mines in the Masac concession in Lower California. Wo Mon Sing, the head of the syndicate, has returned to San Francisco to purchase a large quantity of mining machinery which will be used in crushing the ore from the Pueblo mines in Canada Rica, about two miles from Real del Castillo. A flume five miles long is nearly completed, which will furnish water to the mines. The Chinese have invested already $40,000, and will spend some $250,000 altogether. Our local foundries will reap a benefit in the manufacture of the mining machinery.

PLAN OF DE BEERS MINE—PRESENT SYSTEM OF WORKING—700 FT. LEVEL.

NEW SYSTEM OF WORKING DE BEERS DIAMOND MINE—800 FT. LEVEL.

Astronomical.

The Astronomical Society of the Pacific, which was founded in this city last February, now has 145 members, and is in a flourishing condition. It was the result of the co-operation of professional and amateur astronomers in successfully observing the total solar eclipse of New Year's Day, and the association is continued both as a scientific and social force. The new society is designed to be popular in the best sense of the term. Any person who takes a genuine interest in astronomy is invited to join its membership, whether he has made special studies in this direction or not. It is believed that every such person will get, and will feel that he gets, a full return from the society, through its meetings, or through its publications. Three meetings a year (March, November, January) are held in San Francisco, at the rooms of the society (408 California street); and three meetings (May, July, September) are held at Mount Hamilton—where an opportunity is afforded to the members to see and use the instruments of the Lick Observatory.

The *Publications* are printed in octavo form at irregular intervals; 100 or more pages a year may be expected. The *Publications* contain papers read before the society (either in full or in abstract), plates, etc., the minutes of the meetings; and also *Notices from the Lick Observatory*, which are brief and popular accounts of the current work of that establishment, prepared by members of the Observatory staff. Such notices have previously been printed in various astronomical journals, but in future can be found in full only in the *Publications*. It is quite a help to the new society to have the Lick Observatory work recorded in its proceedings and published by it, and will have the effect, doubtless, of largely increasing its membership. There are no initiation fees, and the dues are only $5 a year. The secretaries are Charles Burckhalter of the Chabot Observatory, Oakland, and J. M. Schaeberle of the Lick Observatory.

The Lick Observatory, by sanction of the Regents of the University, has published the "Reports on the Observation of the Total Eclipse of the Sun of Jan. 1, 1889." Professor Holden has contributed an excellent article, giving the results of the observations and an analysis of the different photographs made by the professionals and amateurs. Some of the best photographs are figured. Those presenting accounts of their individual observations are J. M. Schaeberle, Jas. E. Keeler, E. E. Barnard, C. B. Hill, A. O. Leuschner, Charles Burckhalter, Mary K. Curran, G. W. Dornin, Clark L. Goddard, W. C. Gibbs, C. P. Grimwood, J. H. Johnson, O. V. Lange, W. H. Lowden, C. F. Montealegre, W. L. Oliver, S. C. Passavant, W. M. Pierson, G. W. Reed, G. Tasheira, A. J. Treat and E. L. Wood. The reports are of various lengths and all of more or less scientific value. Published at Sacramento at State Office, by J. D. Young, Superintendent State Printing.

The results of experiments made with samples of gas coal recently sent New York from veins tributary to the Clinch Valley division of the Norfolk & Western railroad, Virginia, established the fact that they will command a share of the business now enjoyed by the Pennsylvania, Westmoreland and Youghiogheny coals in all the Eastern markets. They are equal in quality to the best coals in the districts named, and are thought by experts to be superior to the best coals mined on the Chesapeake & Ohio and Baltimore & Ohio roads.

There are 197 stamps now dropping on Comstock ore in the following mills: California, 70; Morgan, 44; Brunswick, 20; Occidental, 20; Alta, 15; Justice, 10; Hully, 5; Fisher, 4; Pfleifer, 4; Courser, 5. The above crush daily about 500 tons.

Arrangements have been made to have Gabriel, the old Indian at Monterey, who is said to be 150 years old, brought to this city, and next week he will receive callers at the rooms of the State Board of Trade on Market street.

THE California Automatic Can Company, which has bought the right from the Boston Company for the Pacific States, Alaska and British Columbia, may justly be reckoned among the chief industries of the State. It is the only company of the kind in the world manufacturing cans for packing fruits within the legal requirements of the late enactments of France and Germany, and which will soon be adopted in this country, Charles J. King, Secretary of the California Canned Goods Association, being at present engaged with that end in view. The process by which these cans are manufactured is unique and ingenious. The factory is on Brannan street, between Third and Fourth, the company having leased a portion of the factory of A. Lusk & Company, where the doors are always open to those interested in the State's institutions and progress. This remarkable machine began work on the 15th of July, since which time it has turned out about 2,500,000 cans. The process is begun by a set of steam scissors cutting a piece of tin 14x20 into four parts which is passed to a feeder, then fed by a rosin flux of oil, instead of acid, as of old; then by means of clamps on a revolving wheel the can is formed, carried through its various processes by means of steam tramways to the finishing touch, a hydraulic machine which dips it into hot water and subjects it to a test pressure and lastly deposits it in crates a perfect can for fruit-packing made without any inside solder and free from acid.

Assessment Notices.

Lapanta Consolidated Mining Company.

Location of principal place of business, San Francisco, California. Location of Works, Hawthorne Mg Dist., Esmeralda Co., Nevada.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 2d day of October, 1889, an Assessment, No. 2, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 2d day of December, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 1, 1889.

412,059.—ELEVATOR SAFETY DEVICE—Henry Albert, Crescent City Cal.

412,066.—SAFETY GAS-COCK—J. P. Becker, S. F.

412,172.—SEPARATOR—J. M. Finch, Crockett, Cal.

411,860.—TRIP-HOOK FOR HAY ELEVATORS—C. Hamaker, Bonanza, Or.

411,988.—MUSTACHE GUARD—M. E. Harrington, Oakland, Cal.

412,087.—DERRICK—Jas. B. Harrison, San Jose, Cal.

412,093. HINGE—Carl Jaenig, S. F.

412,094.—PHOTO-PRINTING FRAME—Geo. A. James, S. F.

412,099.—WIND-WHEEL—John D. Keller, S. F.

412,102.—SWATHER—W. H. Lamrock, Coyote, Cal.

412,131.—FRUIT-DRIER—D. L. Smith, S. F.

412,050. VEHICLE AXLE—P. Somerville, S. F.

19,332. DESIGN—J. P. Kerr, San Jacinto, Cal.

The following brief list by telegraph, for Oct. 8th, will appear more complete on receipt of mail advices:

California—Carl Blomquist, Pescadero, coupling keyboard for organs; Walfred Barkman, assignor to C. H. Frost, Los Angeles, clay reducer; Manuel Corranza-Guatemala, and J. M. Tiaveo, San Francisco, electric igniting device for lamps; Henry T. Hayes, Oakland, fire-ladder; Jonathan S. Jaquith, Sierra City, tool handle; George H. Little, Los Angeles, agricultural machine; Joseph Lyman, San Jose, book stapling machine; Pedro Napoles, Napa, distilling apparatus; James Tullock, Angels' Camp, ore concentrator; Frank Wilcomb, San Francisco, assigned to Wilcomb Knitting Machine Co., Jersey City, N. J., knitted undershirt.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable prices, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WIND WHEEL.—John D. Keller, S. F. No. 412,099. Dated Oct. 1, 1889. This invention relates to the class of wheels specially adapted to be run by wind-power, and the invention consists in the novel constructions and arrangements whereby the blades, wings, or fans of the wheel are made to open to catch the wind above and to close up in coming against the wind below. The object is to provide a wheel of this class, which by reason of its adjustable blades or wings shall present as little surface in coming against the wind below as possible, thereby reducing the resistance to its rotation, and which shall, when in the wind above, spread its blades out to their full capacity for taking all the wind.

VEHICLE AXLE.—Philip Somerville, S. F. No. 412,050. Dated Oct. 1, 1889. This invention relates to that class of axles for vehicles in which independent wheel-carrying spindles are properly journaled in the ends of the axle. The object of this invention is to provide an axle of this class in which the connection of the wheel-carrying spindles and the axle is a simple and effective one, permitting their ready adjustment and oiling.

DERRICK.—James B. Harrison, San Jose. No. 412,087. Dated Oct. 1, 1889. The invention consists in a novel construction and arrangement of parts, the object of which is to enable the load to be raised and simultaneously turned to a varying position of discharge, as may be desired. By reason of the construction a balance is given to the machine, the strain on the hoisting-rope at one end of the beam or boom balancing the strain of the load on the other end, so that the entire device operates and moves easily.

SAFETY GAS-COCK.—Johannes P. Becker, S. F. No. 412,066. Dated Oct. 1, 1889. This is one of that class of safety cocks in which spring-controlled catches mounted upon the rotary valve stem of the cock are adapted to engage with notches in a flange on the base of the valve seat, whereby the valve is locked in closed position. The object is to positively lock the gas-cock in a closed position so as to prevent the escape of gas by the accidental turning or movement of the valve after it has been closed.

PHOTOGRAPHIC PRINTING FRAME.—Geo. A. James, S. F. No. 412,094. Dated Oct. 1, 1889. It has been customary to make the frames for the printing of photographs of wood, having a wooden holding-plate hinged in the center and provided with springs, which keep it pressing against the negative and the sensitized paper after these have been placed in the frame. The hinge is intended to allow a portion of the plate to be turned back and examined from time to time to ascertain the progress of the printing, the half that remains fastened retaining the paper in its proper relation to the negative while this is being done. In the construction of these frames they must be made of considerable thickness, and it is not possible to turn the hinged plate back sufficiently to enable the operator to obtain a good view of the print on account of the thickness of the plate, and for the same reason great care must be taken to expose the same squarely to the light of the sun, in order to prevent the projecting thickness of the edges from casting shadows, which will spoil the print. Mr. James makes his plate-holders of thin but stout metal and has made other improvements which overcome objections to the ordinary form of plate-holder.

ELEVATOR SAFETY DEVICE.—Henry Albert, Crescent City, Del Norte county, Cal. No. 412,059. Dated Oct. 1, 1889. The invention is an improvement in the reversible catches patented by the same inventor April 5, 1887 (No. 360,504), and also in connection with said catches of novel clamps dependent for their operation upon the reversible catches and adapted to bind upon the sides of the shaft or well-timbers, whereby additional security is rendered and much of the weight taken from the catches. The object of the invention is to provide a safety appliance for elevators of a character simple in construction and efficient in operation.

HINGE.—Carl Jaenig, S. F., assignor of one-half to Max Pauly. No. 412,093. Dated Oct. 1, 1889. A strap adapted to be screwed to one of the parts to be hinged has a projecting disk formed upon it; another similar strap with a similar disk is secured to the opposing part. The disks project sufficiently to overlap the opposing straps, and they are united centrally by a pivot pin or bolt. In one of the disks is an elongated slot through which passes a thumb-screw. By loosening this screw the two straps may be moved apart or brought together, turning about the pin as a center, and by tightening the screw the hinge is locked and the straps are held in the position to which they are adjusted. This hinge may be applied to many purposes, but is specially useful for step ladders, since it will hold the two parts of the ladder at any desired position.

SEPARATOR.—John M. Finch, Crockett, Contra Costa county, assignor of part to John R. Cross of San Francisco, Geo. Riley of Vallejo and Frank Miller of Marysville. No. 412,172. Dated Oct. 1, 1889. This invention relates to the class of machines for the separation of materials according to specific gravity, the separation taking place in a revolving body of air. The object of the invention is to provide a simple and effective machine of this class adapted for the separation of any materials, but principally applicable to mill-stock.

SWATHER.—Wm. H. Lamrock, Coyote, Santa Clara county. No. 412,102. Dated Oct. 1, 1889. This relates generally to the class of mowing machines, and particularly to that class of attachments thereto known as swathers, the object of which is to turn the grain over into the swath away from the standing grain. The upper directing-arm is pivoted and supported by springs so as to have a freedom of movement which results, by reason of the traveling and jarring of the machine, in a constant vibratory or shaking movement of said arm. In the ordinary swathers the grain falling on the upper portion or upper arm thereof is inclined to stick and will not let go, because the arm is usually rigid; but with this improved vibratory-arm the grain or hay cannot lodge upon it or stick, as it is constantly agitated, and as the weight of the hay or grain is increased, the arm yields sufficiently to make it slip off, which result is assisted by the jarring movement of the arm. This is the principal object, but it subserves a further purpose as follows: In the improved mowing machines now in use, the sickle may be turned downwardly toward the ground to operate upon lower grass, and where the arm of the swather is rigid, it is obvious that said arm is elevated, which makes it more difficult for it to throw the grain off; but with this improved freely moving arm the weight of the grain presses it down, so that it can slip off as usual. There are certain other improvements in construction covered by this patent.

W. B. FROST—Montana and Idaho.
JUAN C. JENS—New York City.

MINT DIRECTOR.—The President has appointed Edward O. Leach of the District of Columbia to be Director of the Mint vice James P. Kimball of Massachusetts, resigned. Mr. Leach has been computer of bullion in the Mint bureau for many years, and is well qualified for his new position. The appointment meets with general favor in the Treasury Department, being regarded as in the true line of civil service reform, a promotion for merit, and in general one of the best appointments made by the present administration.

CONCENTRATORS.—J. W. Shaw received the medal at the Mechanics' Fair for the best wet ore concentrator; and James B. Freeman for the best dry concentrator.

Mining Personals.

Charles Jacob, a mine-owner of Mokelumne Hill, is in town on business connected with his mines.

J. H. Marriott has been in charge of the Osceola gravel mine, Nevada, for the past five years.

George W. Grayson and A. Borland, two Oakland mining capitalists, have gone to New Mexico.

Charles Brown died at Sitka, Alaska, on Sept. 12th. He went to that country as a prospector in 1861.

Mr. Blandy is industriously at work collecting specimens for exhibition at the Territorial Fair, Arizona.

Allan McDonald succeeds J. K. Pardee to the superintendency of the Iron Mountain mine, Phillipsburg, Montana.

Two hundred dollars a ton is what A. W. Callen is getting out of his Silver Queen mine, Walnut Grove, Arizona.

Maurice P. Hays of Bridgeport, Mono county, has been elected recorder of the new Green creek mining district in that county.

J. K. Owen, who is a well-known contractor for mining machinery, has returned from South America after an absence of two years.

D. B. Lyman, superintendent of the Con. Virginia and California and other North End mines on the Comstock lode, is in this city.

Mr. A. B. Paul is down from Shasta county on business connected with the mine, where he has his dry process of amalgamation in use.

Dominick Briden has been appointed superintendent of the Andes mine on the Comstock. The former superintendent was Oscar Steele.

John Branon, for a long time an employe at the Sierra Buttes mill, has gone up to take charge of the Young America mill, Sierra county.

M. L. Elliott has returned to Grass Valley from Amador county. He has resigned the superintendency of the Keystone mine of Amador.

Postmaster C. R. Clarke of Nevada City opened the first hydraulic mine in Central America—the Malpaso, State of Tolima, U. S. of Colombia.

J. E. Fillmore has resigned the position of shift-boss at the Omaha, Nevada county, and gone to take the place of foreman at a mine in Monterey county.

The suit instituted by P. J. Keyes against the Keyes Mining Co. to recover $4000 said to be due him for salary, etc., has been dismissed, Mr. Keyes having withdrawn from the suit.

G. S. Check of this city is said to have gained the support of Kansas City capitalists in his scheme of working refractory ores at a cost of only $3 per ton. The process which he claims to have discovered is a secret one.

A. Rocco, for 14 years past superintendent of the Great Western Quicksilver Mining Co., goes to Mexico to manage a quicksilver mine and a group of silver mines owned and controlled by Signor Romero Rubeo, Secretary of State of Mexico.

F. Chappellet has resigned as acting superintendent of the Mayflower mine, Placer county, and a gentleman named Beach of Spokane Falls has been selected for the position. Mr. Chappellet will, however, remain at the mine for some months, but he will devote himself chiefly to the development of the Eureka mine.

William Armstrong, says the Virginia *Enterprise*, formerly superintendent of the Brunswick mill on the Carson river, but now superintendent of the Jesus Maria mine in the State of Chihuahua, Old Mexico, wrote to Hon. F. P. Langan to send him a number of Comstock miners—that he couldn't get along without them. He promised them six months' work at $4 a day, payable in U. S. gold coin; they must pay their fare out, but after working six months they will be entitled to draw on the company for the same. In accordance with the foregoing terms Randall Campbell, Sam Smith, Thomas Poynton and Michael McCullom, all first-class men and miners, have signed to go.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

California Fruit Farms.

$1.00 A WEEK INVESTED IN A CALIFORNIA FRUIT FARM

Will make you a pleasant home and be a safeguard against poverty. Think carefully about this proposition. Thousands of men and women spend their money as they go along and have nothing to show for it.

We have taken one of the finest tracts of land in the famous Fruit Belt of California, viz: the Sacramento Valley, and are selling it in subdivisions of 5 acres each at $75 for each 5-acre tract, payable $1.00 per week, no interest or taxes until you have paid in full.

You can pay more if you wish at the same rates and terms. Title U. S. Patent; land everything that it is represented to be, good fruit, farming and vine land.

Apply immediately for maps and information. Or if you wish, send your first payment, viz: $1.00 for each 5 acres required, and we will return you your contract, maps, etc.

Such an offer has never been given before and never will be again. Apply immediately, as this advertisement will only appear twice in this paper. "A word to the wise is sufficient."

FRISBEE WET MILL.
This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS
And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.
OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.
FRISBEE-LUCOP MILL COMPANY.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

Over 800 in Use in all Parts of the World.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

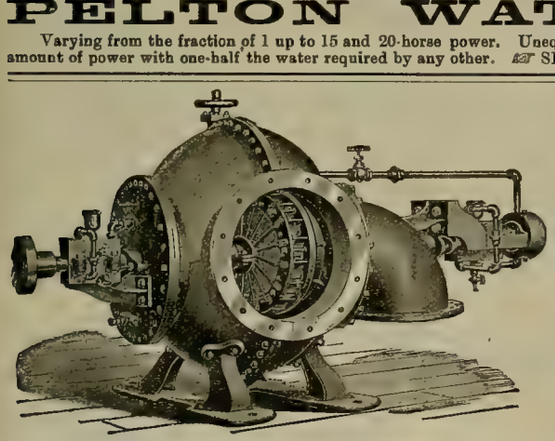
Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS



Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

120 FIRST ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 10, 1889.

Trade the past week was fairly active in all lines. Iron-workers and manufacturers in general report more activity in their branches of trade. The local money market is easy, with Eastern banks carrying a handsome surplus. This is reflected in the annual statement of the Bank of California and Nevada bank, which gave the cash on hand at over $3,200,000. The first named had over $1,900,000, and the latter over $1,300,000. The two banks also report good remunerative business for the past year. Remittances from the interior are steadily increasing. The demand for exchange on New York is still fairly active.

MEXICAN DOLLARS—The demand the past week has been good from the Chinese, but only fair from banks. The price now quotable is 75¾@76c.

SILVER—The market is very strong at 94c bid, with holders asking more money, owing to the steamer for China leaving on next Thursday, and also to to the strong advancing market abroad for silver. The growing favor with which bi-metallism is received in this country and abroad is undoubtedly having a beneficial effect on the market. Leading English mono-metallic papers are advocating the Bank of England retaining part of its reserve in silver. From the favor in which this is received, we judge it is only a question of a short time when the bank adopts the suggestion, which will be quite a victory for silver.

QUICKSILVER—Receipts the past week aggregate 261 flasks. The market is barely steady. The demand is still light.

LIME—Receipts the past week aggregate 4285 bbls., and exports by sea 825 bbls. to Honolulu. The market is still active, but in prices it is reported that there is some cutting.
